Gardening in New Zealand, 158; Old English, to the end of the 17th century, and garden books, 33; old-time—a country garden, 94; old-time—John Parkinson's books, 263; old-time-florists, the early, 315; old-time—Tradescants and other introducers of plants, 575; window, 141

Garrya elliptica fruiting, 473

Geranium (Pelargonium) roots, storing, 385; the suburban, 577

Geraniums in boxes for garden decoration, 305

Gesnera exoniensis, 513

Gilman, Mr. E. T., 538

Gladiolus diseased, 524

Gladioli at Cornell, 300; from Langport, 216

Glenville Gardens, Waterford, 215

Gloucestershire, orchard planting in, 577

Golden flower, the, 508

Goodwood, the Cedars of, 327

Gooseberry, wonderful, 34

Gooseberries as standards, 120; cordon and Currants, 540; unhealthy, 276; v. business, 39

Grape—Muscat Hamburg, 277; varieties of Black Hamburg, 67; Vine, essay on the, at Hull, 541

Grapes at Bath show, 218; at the Chiswick show, 442; at Pitcullen, Perth, 402; for exhibition, plan and dimensions of boxes to carry, 160; Muscat, shanking and shrivelling in the stalks, 114; notes on the

## GRAPES—continued

varieties of, 378; shanking, 43; spots on, 365; spotted, 91; the merits of, 403; travelling, 491

Grass, bad effect of, on Apple trees, 290; seeds for renovating permanent pastures, 276

## H

Hall, the Horticultural, Baron Schröder's appeal on behalf of the, 537

Halls, public, for floral exhibitions, 510

Hartham Park, Wilts, 488

Heating and Ventilating, lecture on, 486; book on, 524

Heaton, Mr. S., 372

Hedges for ornament, shelter, and profit, 292, 299; shelter, 285

Hedysarum multijugum, 371

Hellebores, culture of, 524

Herefordshire, fruit in, 53

Heywood and horticulture, 204

Hibiscus syriacus, 370

Hints, useful, 515

Holland House floral fête, jottings on the, 9

Hollies, a dozen select, 592

Hooker, Sir William Jackson, 291.—Norwich and Halesworth, 291, 335; II, Glasgow, 1820—1840, 349, 404, 414

Hopetoun House, new head gardener for, 331

Hop growers, 170

Horne, Mr. W., senr., 103

Horticulture and character, 308; and home industry, 411; gold medallist in, 77, 122; in Tasmania, 128; (1904), R.H.S. examinations in, 375; modern progress in, 556, 580; science, American soc. for, 189; the banner of, of, 158

Humex elegans, harmful effects of, 582

Hyacinth glasses, 275

Hyacinths, commercial culture of, 282; for baskets, 459; Roman, 150

Hybrids, peculiar, 340

Hybridists and "heredity," 302

Hybridising and crossing plants, 466

Hydrangea flowers, how to make blue, 327

Hydrocyanic acid gas fumigation, 482

Hypericums, species of, at Kew, 215

Humphreys, Mr. Thomas, 80; presentations by Chiswick confrères, 262; presentations by the R.H.S. Committee and by the Horticultural Press to, 312

## I

Impney Hall, Droitwich, 288

Indiarubber plant with holes in leaves, 160

Industry, a new Irish—pasture seeds, 216

Insects as garden adornments, 71, 216, 373, 609; Codlin moth, the, 52; depositing eggs on garden fencing (Tiger moths), 161; injurious, U.S.A., 165

Ipswich gardeners' outing, 31

Ireland, C. C. Instructors in Horticulture, 560; early Potatoes from, 48, 164; fruit crop in, 239

Irish prospects, 260

Iris leaves going off, 365

Kew, notes from, 581; rare Orchids at, 303; shrubs and undershrubs at, 76; species of Hypericum at, 215; the greenhouse at (September), 215; the greenhouse (December), 515, the Palm House, 439; the "undergraduates" at, 100

Kingswood (Bristol) Show, 211

Kitchen garden, 20, 66, 114, 160, 205, 253, 297, 341, 385, 523, 568, 608

Kylemore Castle, 289

## L

Lælia Finckeniana, 436

Lælio cattleya Decia, L.-c. Decia alba, 433; L.-c. Norma superba, 436

Laird, Mr. and Mrs. D. P., silver wedding, 330

Land, back to the, 9, 29, 49, 77, 122

Lapageria, propagating white, 430

Latham, Mr. W. B., 219; testimonial to Mr. W. B., 283, 366

Lawn—extermination of Trefail, 100

Lawns, destroying moss and noxious weeds on, 593

Leaves, skeletonising, 231

Legal notes—Holloway's protected, 170; Ware's local rating appeal, 214; value of a Holly hedge near Newport, Mon., 577; West Wycombe Horticultural Society, 170

Lettuces at the Drill Hall, 292

Libonia floribunda, culture of, 327

Light, effect of, on plant life, 81

Lightning and trees and plants, 829

Lilacs, budded, 305

Lilium Harrisii, 242; in the flower border, 326; Martagon, and its white variety, 23; pardalinum, 25; × Mrs. T. Roosevelt (new), 459; Stephens' hybrid (new), 327; speciosum, 104

Liliaceæ, the—Agapanthus, 492; Androstaphium violacea, 492; Bessera elegans, 492; Blandfordia, 435; Brodiaea, 492; Chionodoxa, 493; Urginea, 493; Dipsadi, 492; Fritillaria, 415; Funkias, 435; Galtonia, 493; Hemerocallis, 435; Hyacinths, 493; Lachenalia, 492; Leucocyrrne, 492; Lilium, 493, 552, 585; Massoni, 492; Muscari, 493; Ornithogalum, 493; Phormium, 435; Scilla, 493; Tritomas, 435; Tulbaghias, 492; Tulipa, 585; Veltheimia, 493

Lily of the Valley, retarded, 283

Liming, 123

Liverpool Botanic Garden, 419, 598; parks' inspection, 51

Longleat, Melons at, 311

Lowfield Nurseries, festivities at, 375

Luffmann, Mr. C. Bogue (a notable Australian horticulturist), 487

## M

Manchester Botanic Gardens, 52

Manetti Stock, a plea for the, 194

Manure from horses that are bedded down with sawdust, 321

Manures, phosphates for fruit trees, 521; their use and abuse, 367

Manure, farmyard: variation in the quality and character of dung, 422; conservation agents, 443; treatment of dung in the field, 494; treatment of dung in the home-stead, 443; experiments with at Alfrinton, 594

Manuring, experimental, 1

Marrow jam, recipe for, 292

Masdevallias, 574

Masters, Dr. M. T., on Conifers, 485

McIndoe, retirement of Mr. James, 353, 438

Measurements, finding cubic, 592

Melon, decaying, 43; leaves rusted, 254; plant going off at the base, 195; Pres. Loubet, 70; the new 'Fiscal Problem,' 403

Melons at Longleat, 311; late, 586; rock, 184; sweating, 21; treatment of, 102

Mendelian theory, the, upheld, 340

Michauxia campanuloides, 125

Millipedes and centipedes, 424, 442

Missouri Botanical Garden, destroyed, 503; tree Ferns at the, 452

Mitraria coccinea, 419

Mole, against the, 194; a plea for the, 167

Mules, Dr., his garden at Gresford, 3

Muscats, shrivelling of, 239

Mushroom beds, outdoor, 21; giant horse, 305

Mushrooms in boxes, growing, 569

## N

Names, practical help in plant naming, 508

Narcissi, classification of (P. R. Barr and F. W. Burbidge), 933; Professor Hillhouse's scheme, 234

Narcissus, Gloria Mundi, 295; Sulphur Phoenix, 237; Tazetta (Chinese Sacred Lily), 259

Natural History, Arctic, 382

Nectarine, a pot, 269

Nepenthes × picturata, 282

New Jersey, canning interest in, 204

Newton Mearns, notes from, 418

New York Parks, 124

New Zealand, horticulture in, 158

Nicotiana Sanderiana, 485

Nitrogen, soil, 93

Nomenclature, plant, Celtic element in, 146

Norfolk, in pleasant, 539

Notes and notices, 5, 31, 52, 72, 124, 146, 170, 191, 219, 244, 262, 293, 308, 330, 353, 375, 441, 456, 508, 557, 576

Notes, a wanderer's, 194

Novelties and rarities, 435

Novelties or improvements in flowers, 573

Nursery, a great fruit, 396

Nurseries, register of, 53

Nut, Duke of Edinburgh, 315

Nuts and Filberts and Mirabelles, 303

## O

Oak, the scarlet, 439

Oakbrook, Sheffield, autumn flowers at, 557

Obituary—Gardiner, F. A., 156; Hederley, J. S., 156; Housley, Wm., 219; Kitley, J. M., 375; Lindsay, James, 53; Newell, Abraham, 464; Pond, William, 73; Shand, William, 308; Smith, James, 296; Summers, G., 418; Thompson, Wm., 25

Olearias, 529

"Orchid Day," an, 352

Orchids, troubles of an, 532

Orchid League, the, 419

Orchid or Violet Day, 351

"Orchid hunt, the" (theatrical play), 353

### Experimental Manuring.

**S**URELY, if slowly, our knowledge of manures, their properties with the best means of application, grows wider, and some at least of the old-fashioned prejudices in favour of the contents of the dung-cart, and that alone, is gradually disappearing. Owing to its mechanical action upon soil and power of retaining moisture during periods of drought, it is not to be expected that farmyard manure will ever wholly disappear from cultivated land. Nor do our most advanced scientific teachers propose that it should; rather do they advocate—and the results of their experiments in most instances prove its advisability—a combination of dung in reduced quantities against the heavy dressings now so frequently given in gardens, and artificial fertilisers in proper degrees of strength.

In the latest issue of the Royal Horticultural Society's Journal nowhere could be found more striking illustrations, both in printed matter and pictorially, of the increased power of yield given to the soil by carrying out such a policy as is above indicated. I allude, of course, to the report of Dr. Bernard Dyer, entitled "The Manuring of Market-Garden Crops." Most interesting in this are the tables given, showing the cost of manuring with farmyard dung alone, both heavy and light applications, and combinations of this with phosphatic, potassic and nitrogenous commodities in their artificial forms. The comparisons of expenditure alone should prove of great educational value to those who will carefully peruse them, showing as they do in favour of more modern methods to a startling degree against the cumbrous and expensive 50 loads to the acre.

One of the most striking results obtained in the whole of the experiments is the value of potash in the culture of root-crops, Parsnips,

Carrots, Beet, and Onions all deriving great benefit from the application of this item, given either in the form of kainit or sulphate of potash, in addition to the other fertilisers. In this connection it may be noted the detrimental effect of this manure upon Strawberries. Proof is given of an appreciable loss in weight on each occasion of its application. With this crop note should be taken of the decided gain in earliness by the use of the artificial manures.

The question of quality in the products has received due attention, but here the gardener must proceed with caution. Many of his crops must in an all the year round supply have lasting properties, and the use of nitrate of soda in large doses for Broccoli, Celery, spring Cabbage, or similar crops which pass through the winter for use during that period and in spring ought not by stimulants of a forcing nature to be rendered soft and tender and altogether free from vascular tissue, otherwise their chances of surviving continued hard weather are remote. Experiments of my own have proved this over a term of years to the satisfaction of myself and interested friends. Noteworthy, too, are the data obtained from the experiments carried out with leguminous plants. Lucerne is outside the scope of private gardening, but the heavy gains from the use of nitrate of soda in addition to the potash and phosphates should give careful readers food for thought. The gain with Dwarf French Beans is shown to have been equally substantial, but no practical results followed its use upon Green Peas except in distinctly better quality of produce.

These are but a few of the many crops upon which experiments have been tried. The report proves conclusively what is becoming more widely known every year—that artificial or supplementary fertilisers, though they cannot possibly displace farmyard manure, they may, when used with discretion, aid the market grower and farmer in reducing in great measure heavy cartage and railway charges, and add inestimably to the fertility of the land.

The trials of the varying quantities and combinations of manures have been carried out on what was, when taken in hand by Dr. Dyer and his eminent colleague, Mr. Shrivell, ideal land for the purpose, being poor and incapable of producing a remunerative return in any way. I should like to see the report placed within the reach of every market grower and every young gardener—yes, and many older ones, too—in the kingdom. No higher praise than that could be given.—PROVINCIAL.

## Notes for Exhibitors.

The dull, sunless skies and deluge of rain recently experienced must have caused great anxiety to exhibitors of garden produce generally, because such climatic conditions render the task of "timing" the exhibits an extremely difficult one, especially in the case of those intended for early shows. Under favourable conditions in regard to weather it is by no means an easy matter to get either fruits or vegetables in the best condition early in the season, and during unfavourable seasons the difficulties are greatly intensified. Nothing in the way of cultural attention can wholly make up for lack of sunshine; still, much can be done to help crops forward at critical times, and no ambitious exhibitor can afford to neglect such necessary attention. The following notes will, I trust, be of service to many, if only as reminders.

PEACHES AND NECTARINES.—The full exposure of the fruits to sunshine and air at an early stage is a matter not likely to be neglected, because obvious to all. All cultivators, however, do not take the greatest possible advantage of sunshine when it does occur, in those instances in which it is necessary to push the fruits on as quickly as possible. While the last swelling is taking place, much can be done to hasten maturity by closing the house at 2 p.m. and syringing the trees and walls of the house heavily. During dull days and every night a little heat should be kept in the hot-water pipes, and the time-honoured "chink" of air left on the top of the house. The syringing of the foliage can safely be continued till the fruits show signs of becoming soft, and they are often perfectly coloured before that stage is reached. Just before colouring commences the soil of the borders should be thoroughly examined, and if sufficiently

dry, liquid manure and some chemical fertiliser given. There are many excellent manures suitable for the purpose advertised in the *Journal of Horticulture*. Where liquid manure is not easily obtained an excellent stimulant may be made by dissolving 1oz of nitrate of potash and a similar quantity of phosphate of potash in one gallon of water. This liquid will also help to give the fruits high colour. When there is no need to hurry the above crops the houses in which they are grown should never be entirely closed, but the air gradually reduced during the afternoon. Under this treatment the fruits are not usually quite so large as under the early closing system, but they are firmer in texture and often more highly coloured. Lord Napier Nectarine will not bear syringing so late as other varieties. If the fruits are so treated after colouring commences, they will often become brown and spotted on the surface.

GRAPES.—Both black and white kinds can be brought on quickly after colouring commences by greatly reducing the air early in the afternoon of sunny days. I always consider it an advantage to grow them in houses with a south-east aspect, because the ventilators can then be closed entirely fairly early on bright afternoons without danger to either the foliage or the berries. A little air should, of course, be again admitted early in the evening. A common mistake made with Vines of all descriptions is to increase the amount of air given too suddenly after colouring commences. It is only when the berries are almost ripe that very abundant ventilation is either necessary or desirable, except when very hot weather prevails. In the case of black Grapes damping the floors, borders, and walls should be continued until the Grapes are almost ripe. Atmospheric moisture must then be gradually lessened. More black Grapes are prevented from colouring perfectly by maintaining too dry an atmosphere than by the opposite conditions. Madresfield Court is, however, an exception in this respect on account of its liability to crack. When it is necessary to hurry this fine variety, a good deal can be done by gradually tying back the foliage and exposing the berries to full sunshine. Under this treatment they take on a dense black colour and fine bloom quite up to the base of the footstalks. Immediately the colouring is completed the leaves should be returned to their original position, or the objectionable red tinge will soon be visible at the base of the berries.

All white Grapes intended for early shows should, as soon as the colouring stage has been reached, be gradually exposed to full sunshine by tying back the foliage, and a black board fastened at the back of special bunches will do something to attract the sun's rays. Those which have plenty of time to ripen should not have this full exposure, because if the shoots are trained thinly the leaves over the bunches will only provide a very thin shade, and the rays of sunshine will reach the berries between the leaves and cause them to colour evenly. The process is a slow one, but gives the most satisfactory results in the end. In the case of white Grapes, the exhibitor cannot always wait for best possible results, but rather aims to get the best results obtainable under the circumstances by a given date. With the exception of Buckland Sweetwater and Foster's Seedling, all white Grapes need a good deal more fire heat during the colouring period than black ones. This is particularly the case with Muscats, and those who have not tried the plan will be surprised to find how the "golden tint" may be laid on from the present time onwards by a little heat in the hot-water pipes throughout the day, except when the sun is very bright, and gradually reducing the air in the afternoon to send the temperature up to 85deg or 90deg. I could give some startling illustrations on this point about the practice of a noted exhibitor of ten or fifteen years ago.

An excellent stimulant for Vines during the colouring stage may be formed by mixing nitrate of potash and phosphate of potash in equal quantities. Apply at the rate of 2oz per square yard, and water it in. A somewhat cheaper yet equally good mixture is the following: Superphosphate, 3 parts; sulphate of ammonia, 1 part; sulphate of potash, 2 parts; 3oz per square yard. An occasional watering with diluted liquid manure from stables and cowsheds is undoubtedly of advantage to Vines and other fruits, but I have never found Grapes colour so well without the application of some kind of chemical manure as when it has been applied. This may be because the artificials supply food in a more appetising as well as more concentrated form than these natural manures do.—H. D.

**Vanda tricolor tenebrosa.**

To-day we figure an individual flower of a very richly marked and solidly built bloom of this variety, as staged at the recent R.H.S. Temple flower show by Monsieur L. T. Draps-Dom of Laeken, Brussels. The inflorescences are borne in heavy clusters, the flowers having intense violet purple lips, with rich chestnut-brown spots over the creamy ground on sepals and petals. It is very handsome and received a first class certificate.

**The Week's Cultural Notes.**

Since my last notes the weather has taken a turn for the better, and should this continue, the growth in the Orchid houses will be much more rapid and satisfactory. The sunshine and higher temperature allows us to keep more air in the warm and cool houses, and does away with the need of fire heat in the latter. In the warmest section it is always best to have a little warmth on the pipes at night, no matter what the weather. It keeps the air moving, and prevents stagnant moisture on the plants.

Although easily grown in a suitable atmosphere the tender foliage of *Chysis*, *Catasetus*, and *Cynoches* is very liable to injury in a bright period following dull weather. Watch these carefully now and lower the blind in the house in which they are grown before the foliage begins to feel warm to the touch of a person inside. In the afternoon, when the house is closed, with plenty of atmospheric moisture, the blind can be run up again and no harm accrue; but hot sun striking them with a dry atmosphere is very injurious. All these enjoy the bright weather and will grow very rapidly now under precisely the same conditions enjoyed by *Dendrobiums*. The roots must be freely watered, and light dewings given over the foliage, avoiding those growths that have reached the cup-like stage, and would collect the water to an injurious extent.

Plants of *Cypripedium insigne* that are now finishing up their growth may, with advantage, be placed in a cool and semi-shaded frame, standing the plants on a cool bottom of ashes or similar material, this being damped several times daily with a syringe. *Cœlogyne cristata* similarly treated finishes up remarkably fine growths and flowers with great freedom afterwards. Do not lose sight, though, of the fact that being practically in the open air the roots will dry very rapidly, and in consequence much more frequent watering will be necessary than when the plants were in the Orchid house.

When room is scarce in the cool house many of the usual inmates may now be removed also to a shady pit or frame. This treatment I have found to suit the macranthum section of *Oncidium*s remarkably well, also many of the *Lycastes*, *Maxillarias*, *Lælia harpophylla*, and the pretty *Ada aurantiaca*. *Odontoglossum grande* and its allies are growing freely, and may be left in the house. Should any plants still remain that require re-potting see to it at once, fine pseudo-bulbs and flower spikes only resulting when the roots are running freely in fresh sweet compost.—H. R. R.

## Dr. Mules' Garden at Gresford.

Last week the members of the Chester Paxton Society, in conjunction with the members of the Chester Natural Science Society, to the number of about one hundred, had an excursion to the beautiful vale of Gresford, when opportunity was taken to visit the celebrated gardens of Dr. Mules, at the Old Parsonage, which is delightfully situated on a rising eminence about 250ft above the sea level. The cultivation of hardy herbaceous and border flowers has long been a hobby of the doctor's, and his collections of these are, perhaps, unequalled, containing as they do many rare and choice species seldom, if ever, met with in an ordinary country garden. The Doctor's numerous Continental and Colonial correspondents keep him well posted in all the novelties in the way of hardy border plants from their respective countries, and anything new that is raised in Great Britain invariably finds a home at the Old Parsonage, provided its merits are of sufficient worth to justify its existence there. The best and choicest of the old fashioned garden flowers are not, however, neglected at the expense of the more recent introductions, as many of these old favourites were noticed in the beds and borders on Wednesday.

Not only does the doctor believe in securing all the newest and best introductions in the way of hardy plants, but he also, along with his head gardener, Mr. James, takes the greatest pains to see that all his plants are well cultivated in that particular class of soil which is best suited for their proper development. The soil here being of a hot gravelly nature, clay loam, roadside scrapings, limestone chippings, and such like have frequently to be introduced to suit the requirements of those plants which refuse to exist in the ordinary garden soil. This high-class culture was plainly visible to the visitors, one of whom, a practical gardener, remarked that every plant appeared to be in the pink of condition. Of special interest was a bed of some 16ft square beautifully laid out with a choice collection of succulents, &c., and including twenty vars. Aloe, twelve vars. Echeveria, twenty vars. Agave, together with various Cacti, Ice Plants, &c.

In close proximity to this was an interesting collection of some twenty varieties of Bamboos and a healthy lot of Nymphæas, in all ten distinct varieties, very full of flower. The plants in the herbaceous borders which attracted greatest attention were *Eremurus Elwesianus albus*, a very fine thing, pure white, and the habit of *Elwesianus*, but a week or ten days earlier, quite distinct from *Himalaicus*. *Richardia Elliottiana* and *Pentlandi*, planted out and growing very strong. *Incarvillea compacta*, a new *Incarvillea*, and said to be very fine. *Campanula mirabilis*, fine flowering specimens. *C. thyrsoides*, very charming spikes of pale green yellow bells. *C. spicata*, blue purple spike, very good. Spikenard in flower. *Trollius Fortunei* fl.-pl. with 4ft spike. *Primula rosea grandiflora*, self-sown in masses. *Primula*

**Vanda tricolor tenebrosa.**

*algida*, the rarest and most highly coloured, growing very strong. *Pentstemon* species: *albus*, *cæruleus*, &c. *Achillea lingulata*: var. *globosa*. *Arabis Billandieri rosea*, nicely in flower, been out all the winter. *Oxalis enneaphylla* (hardy here).

The collection of new hybrid *Verbascums* was a sight well worth going to see in themselves, and very proud of these the doctor is. As showing the mildness of the climate at Gresford, we found *Abutilon vitifolia* in healthy growth and flowering freely; also *Berberis Knighti*, very fine; *B. diaphara*, also choice; *Cytisus Hueffii* and *C. æolicus*, both of the best class.

A well cultivated garden is always pleasant to look upon, but the pleasure is much enhanced when the history and characteristics of the flowers are so lucidly described as they were by the genial host on the occasion of this visit. Added to all this sight-seeing, Mrs. and Miss Mules most kindly dispensed hospitality in a marquee on the lawn, which, needless to say, was greatly enjoyed and much appreciated.

Before taking leave of the genial host and hostesses, a hearty vote of thanks was accorded to them for their great kindness to the party; but the doctor, with his accustomed modesty, took exception to this, maintaining that the obligation was on his part, as both he and the members of his family considered it both a pleasure and a privilege to have entertained the members of the two Chester societies. A final warning from the secretary caused the party to retrace their steps to the station, but this was not done without some amount of reluctance, as all felt that the time had gone much too quickly.—M.

### Roses: Late versus Early Pruning.

The unwisdom of being "too previous" in pruning Roses in the open air was perhaps never more clearly demonstrated than during the present season. The mild bright weather of February caused the upper parts of the shoots to start into strong growth, so that by the beginning of March, in warm districts, the leaves were unfolding rapidly, so much so that the cultivator needed a cool, calculating head to prevent being tempted to use the pruning knife on them thus early. Many could not resist the temptation after the middle of March, with the result that the severe frosts of April completely ruined the buds which started quickly after pruning. Standards and bushes so treated at the present time, as a rule, look miserable, as what growth there is is extremely weak, and great trouble is given with aphids and caterpillars, and good flowers will as a consequence be conspicuous by their absence.

The healthiest and most promising lot of Rose bushes in the open air that I have seen this year are at Barford Hill, near Warwick. The growth is strong and clean, and there is an entire absence of rusty leaves and growths so noticeable where early pruning was practised. Mr. R. Jones, the head gardener, has always been a late pruner, but this year, on account of the cold winds which prevailed late in March, pruning was deferred till the second week in April. Both Mr. and Mrs. Smith-Ryland are particularly fond of Roses, and by reason of their gardener's forethought they will be able to have them in their usual abundance this year also, when so many are bemoaning the sorry condition of their trees.

Those who will have Roses in the open air as early as possible must, of course, prune early, but the man who wants plenty of fine flowers, and does not mind waiting for them, had far better prune a little late than too early.—H. D.

### Tea-scented Roses.

In the centre page illustration we depict a group of Tea Roses, termed by one authority the élite of the Rose world, and they are Niphetos (top), Madame Cusin (the red), Devoniensis, and Gloire de Dijon. Tea Roses are, and ever will be, favourites. Owing to the backwardness of the present season Tea Roses, more than others perhaps, lack the refined quality which they usually possess in favourable seasons. The darker coloured varieties are somewhat tabooed in this delicate section of Rosa, but signs are not wanting of a change toward a wider range of hues. Together with the varieties we figure, the following are among the best popular sorts: Catherine Mermet, Maréchal Niel, Souvenir d'un Ami, Rubens, Caroline Kuster, Souv. de S. A. Prince, Hon. E. Gifford, Anna Olivier, Mme. Margottin, Francisca Kruger, Comtesse de Nadaillac, and Innocente Pirola. These Roses do well away in the north, even as they succeed in southern counties, though the elegance and smooth beauty is not so prominently noticeable amongst Scottish Tea Roses. In all cases, however, they require considerable care, there being so many evils to guard them from.

### Gadding and Gathering.

From the introductory notes on Messrs. Dicksons' nurseries (Chester), it was seen that this representative firm had put into commerce quite a number of the finest ornamental hardy subjects. They believe in being up to date in everything, whether it be new Roses, new Conifers, new seed cleaning machines, or matters of business technique, and their business places and nursery quarters are all exceptionally well appointed. Even in the new office at the "home" nurseries they have what can accurately be called a small museum of botanical and entomological specimens, and in the same room there is a collection of garden implements, from sécateurs to scythes, and nail-bags, trowels, rakes, rollers, *ad infinitum*.

### HALF A MILLION ROSES.

The Roses are a special feature, covering close on twenty-five acres, a quarter of a million dwarfs having been grafted last year, together with some 50,000 standard Roses; and as only a few score of plants remained, the reader may gather from these figures how great is the output. All the newest varieties are included, and every care is exercised to produce the best possible stock. The Rhododendrons are another section of ornamental shrubs to which both space and time is liberally given, with gratifying results, and the selection of handsome standard Rhododendrons is indeed very extensive; and these, coming from this loamy soil, when given a peaty compost in private

gardens, speedily become established, and assume the most robust character. And the Hollies here at Chester are exceptionally good, being of an even, bushy shape, with large, dark, glossy foliage. *Ilex Hodginsi* and *I. nobilis* are greatly in demand, and the handsome *I. camelliæfolia* is another, to form a trio. The gold and silvery variegated forms, and the milkmaid and hedgehog Hollies each find a place.

### ERICAS AND DWARF SHRUBS.

Nor are the dwarf mountain sub-shrubs overlooked, for seldom will a better collection of Ericaceæ be seen than that covering perhaps two acres of ground in the home grounds. The Mediterranean Heath, with *Erica cinerea*, and *Cytisus albus*, *C. scoparius*, *C. Andreanus*, *Andromeda*, and *Arbutus* find a place, in varying stages of their growth. And of a very different nature are the Japanese Maples, in great quantities and of all sizes; while in frames close against where these were could be noted a collection of Show and Alpine Auriculas in pots, which quite surprised me for the variety and general excellence of it. Not far off, either, one could see the fading remains of the popular Narcissi, and Sir Watkin of old-time fame is grown to the number of half a million bulbs; yet while the commoner sorts are so liberally set out, from intimations already given we know that some of Mr. Engleheart's seedlings are in the firm's hands for distribution.

### THE GLASS HOUSES.

Glancing at the houses, their occupants are too numerous to name in detail, but one must rapidly survey the stout-wooded pot Roses, the big collection of pot Clematises, the greenhouse Rhododendrons, the magnificent tree Pæonies, already in flower, and some had seen service at the Chester races about the time of my visit; and with these come the Regal and Zonal Pelargoniums, the fine stock of Tree and Malmaison Carnations, *Romneya Coulteri* filling an entire house, and some span-roofed structures with pot Vines of first-class excellence. The long clean shoots, stout and fresh, and the large leathery foliage were demonstrative of really good Vines. The same remark can be applied to the trained Peaches of all forms and sizes, and I was informed that a great export of these to Italy had been made during the spring by Dicksons. Out of doors there are goodly quantities of pot Apricots, Apples, and Plums (some of them 6ft high) plunged in ashes. On either side of the main entrance to the grounds there are mixed borders of choice trees and shrubs, the study of which would be of importance as a guide to those about to plant extensively.

### THE SEED HOUSES.

The seed houses and business shop of Dicksons is situated in the main thoroughfare of the beautiful and anciently historic town, and from the back parts of the building the lovely Cathedral appears. Seen with its carpet of garish-green grass and half buried tombstones, the elegant and extensive Cathedral, built of charming pink-mauve stone, is a sight that no one can surely help admiring. Messrs. Dicksons, Ltd., are as strong in agricultural machinery as they are in the gardening implements, and the storehouses for their reapers, &c., are behind the shop. The Eastgate front faces "The Rows," those remains of mediæval antiquity which are characteristic of Chester and very few other English towns. "The Rows" are long timbered galleries built on a raised stone pavement or side walk, and the line of old-fashioned shops at the back are thus screened from sun or rain the whole way through. Many of the houses are historical and famous, and not a few are built in the half-timber pattern.

In St. John Street are the agricultural seed stores (for it must be borne in mind that the farmer, as well as the gardener and forester, makes large calls on the firm's resources), with the seed-cleaning machines, the largest and most powerful being driven by electricity from the city supply, and a very speedy and effectual seed-cleaning machine it is. The old "jumpers" are now going into disuse under the stress of the newer rivals. Cereals, grasses, Clovers, root-crop seeds, and sackloads of Potatoes fill floor on floor, though in May, of course, the stores were practically cleared. Importations of seeds are made from all the world wherever the best is obtainable. Even New Zealand, and certainly the U.S.A., contribute their annual quotas of Clovers and grasses. On the basement floor of this fine store the visitor should not omit to see the remains of a Roman wall, which has been inspected by many archaeologists and others. During excavations some years ago the workmen unearthed this solid stone wall, and would soon have proceeded to demolish it had not Mr. Geo. Dickson, the senior partner, discovered and stopped the vandalism. So now it stands there, safe and protected. Chester was a little township prior to the Roman invasion, and these gallant warriors made it one of their principal stations, laying down four leading ways, now termed Northgate, Eastgate, Watergate, and Bridge Street, and they encircled the town with a wall and gates. Few will leave Chester without a walk round its ancient wall, which is the most perfect example of its kind in the kingdom. Eaton Hall, the palatial residence belonging to the Duke of Westminster, is some three miles distant from Chester, and I believe visitors can view the grounds and house by ticket.

# NOTES & NOTICES

## Croydon Horticultural Show.

The Croydon gardeners are holding their annual summer show on Wednesday next, July 8, in the grounds of Addiscombe Court, Addiscombe Road, Croydon, when a good exhibition is expected. There are 127 classes.

## Messrs. Barr at the Royal Botanic Gardens.

Messrs. Barr and Sons (of King Street, Covent Garden) are holding their annual exhibition of hardy flowers and Japanese pigmy trees at the Royal Botanic Gardens, Regent's Park, from June 29 to July 5. The band of the 2nd Life Guards was in attendance yesterday, July 1.

## Ulverston Rose Show.

The North Lonsdale Rose Society will hold its exhibition of Roses, Sweet Peas, Stocks, and herbaceous flowers at Podbush Park, Ulverston, on Friday, July 10, next. On this occasion there will be a liberal distribution of prizes and medals, amounting in all to some £135, including a challenge trophy and a challenge cup for Sweet Peas valued at £30. Entries close upon July 7. To facilitate attendance the committee have made arrangements for the issue by the railway of cheap excursion tickets.

## Isle of Wight Horticultural Association.

On Thursday, the 18th ult., a party of members of the above association, accompanied by Dr. Groves, J.P., and Mr. W. Tribbick, one of the hon. secretaries, had a visiting day at Ryde. "By the courtesy of General the Hon. Somerset Calthorpe," writes one of the party, "we were first permitted to visit his lovely Island seat, Woodlands Vale. In the laying out of the beautiful grounds here the exquisite skill and taste of the landscapist's art is most pronounced, the terraces at varying heights presenting an imposing and pleasing appearance. The walls of these latter are aglow with hardy Fuchsias, thriving luxuriantly, Ceanothus of azure blue tints in profusion of bloom, and many others. Interspersed on these terraces with artistically designed flower-beds are fine specimens of Cupressus macrocarpa, the quickest grown of all this genus, and other choice Coniferæ, including in the background a fine Picea pinsapo. Amongst other subjects surrounding the pretty ponds were grand pieces of Phormium tenax coming into flower. Under glass Grapes, Tomatoes, Figs, and Peaches are grown, the last-named extensively. The trees are looking remarkably well, and are heavily cropped. Strawberries and Raspberries are exceptionally good in the open. A luncheon of substantial viands was followed by an inspection (by the kind invitation of Captain Daubuz) of Buckingham Villa, with its most interesting gardens and the rare collection of trees, plants, and shrubs. Here are many subjects which never come under the observation of the ordinary gardener. The gallant Captain is conversant with the habitats and cultural requirements of all his pets, and has actually imported soil from the Table Mountains, the home of the Disa grandiflora (scarlet Orchid), and sand from the Coast of Cornwall for plants indigenous to that locality. These gardens are not exclusively devoted to rare plants. Roses are superbly grown and flowered. A standard of William Allan Richardson, 6ft through, excited our admiration, and also a magnificent Wistaria, covering in festoon the front of the house. Captain Daubuz was thanked for his great kindness and hospitality shown us, and his gardens were unstintedly praised. The Rose show then claimed our attention. Blooms almost perfection were to be seen in leading stands, and, speaking generally, considering the adverse conditions prevailing this season, the whole display was meritorious in all respects. Through the kindness of Mr. Goble, we were privileged to visit his extensive and renowned nurseries. Carnations are a speciality both in pots and open quarters, and are well grown. Zonal and hybrid Pelargoniums are in quantity and perfection, and hundreds of Orchids in the rudest health. The largest Tomato house, 150ft by 30ft, was a sight to remember. About three tons are annually cut from this one house. Mr. and Mrs. Goble generously provided tea for us on the lawn attached to their residence."

## London Shows.

Yesterday, July 1, London had three interesting flower shows, one at the Temple (Roses), one at Regent's Park (hardy flowers), and a general show at Richmond. Is this not too much?

## Gardening Appointments.

A. V. Coombe, foreman in Longford Castle Gardens, has been appointed to succeed Mr. G. W. Musk as head gardener to Lord de Ramsey, Haverland Hall, Norwich. \* \* John Peattie, foreman in the Gardens, Overtoun, Dumbartonshire, as head gardener to James Kennedy, Esq., Doonholm, Ayrshire.

## Map of the Republic of Peru.

We have received from Mr. Edward Higginson, Consul of Peru, Southampton, a map of that country, with a short description of its climate, features, resources, political organisation, agriculture, commerce, mining and other industries, &c., and the object of the publication is to make known what Peru really is, and what it can offer to emigrants. Copies are obtainable on application to Mr. Ed. Higginson.

## Bristol Gardeners' Association.

This association held its usual meeting at St. John's Rooms, on Thursday, June 25, Mr. E. Poole presiding. The evening was set apart for the reading of "Horticultural Clippings." Prizes being offered for the most interesting. Twelve of the members competed for the prizes, which were awarded to Messrs. Curtis, Kitley, and Hancock. A certificate of merit went to Mr. W. H. Davis (gardener, Mr. Curtis) for *Odontoglossum Pescatorei*.

## Sussex Weather.

The total rainfall for the past month at Abbots Leigh, Hayward's Heath, was 4.33in, being 2.32in above the average. The total fall for the six months was 16.48in—4.31in above the normal. The heaviest fall was 1.74in on the 13th. Rain fell on eleven days. The maximum temperature was 83deg on the 28th, the minimum 36deg on the 13th. Mean maximum, 69.07deg; mean minimum, 46.25deg; mean temperature, 57.66deg, which is 2.15deg below the average. Since the 20th fine warm bright days have brought a welcome change. It came just in time to save the Strawberry crop, which is a fine one.—R. I.

## Royal Horticultural Society.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, July 7, in the Drill Hall, Buckingham Gate, Westminster, 1-5 p.m. Lectures on "Hardy Irises" will be given by Miss Armitage, and Mr. Caparne at 3 o'clock. \* \* At a general meeting of the Society held on Tuesday, June 9, 132 new Fellows were elected, amongst them being the Earl of Munster, the Countess of Lucan, Sir Algernon West, K.C.B., Sir William Eden, Bart., Lady Liddell, Lady Meyrick, and Lady Young, making a total of 900 elected since the beginning of the present year.

## Market Gardeners and Trade Protection.

A correspondent recently wrote to Mr. Chamberlain pointing out that market gardening is an industry which has suffered severely from foreign competition, and asking if his scheme would include the placing of a duty on Apples and other fruits and products sent from the United States and France at low transit rates, which enabled the foreigner to compete most unfairly with the English grower. The following reply has been received:—"I am directed by Mr. Chamberlain to acknowledge the receipt of your letter, and to say that the principle must be established before we enter into details, and that each case must be considered on its merits.—Yours obediently, J. Wilson."

## Weather Notes in Hamilton District.

A welcome rain, but too late for many things, visited the district last week. The Clydeside Strawberry crop will be greatly benefited, if it does not continue long enough to damage the berries, which, by the way, are expected to be ready for market in a few days. The crop will be generally lighter than usual. The frost of the 20th appears to have been universally felt over the greater part of Scotland. Letters from friends tell me that the Potato crop in several places is practically useless, and beyond recovery. A south-east gale of considerable force on the 26th made no small amount of havoc among Peas and other vegetables in the vicinity. Contrary to the expectations of many, the hay crop is evidently to be lighter everywhere than usual.—D. C.

## The "Daffodil King" on Tour.—No. 5.

(Continued from page 533, last vol.)

The conclusion of the fourth instalment of these notes, taken at an interview with Mr. Peter Barr, V.M.H., on his return to London, England, ended with a summary of his impressions of Philadelphia, Pa. These four sections of this serial have briefly summarised the course of Mr. Barr's tour in the Eastern States of the Union, and Canada, and now we make the passage of the great American desert to the fertile, prosperous groves of sunny California; and in this place the interviewer has thought it fit to introduce Mr. Wm. Robinson's description of the central desert of North America, which stretches over parts of Texas, Mexico, and Arizona. In his book, "Alpine Flowers," Mr. Robinson says: "The passage of the great American desert which is crossed on the way from New York to San Francisco is, perhaps, the best preparation one could have for the startling verdure and giant tree-life of the Sierras. Dust, dreariness, alkali—the earth looking as if sprinkled with salt; here and there a few tufts of brown grass in favoured places; but generally nothing better than starved Wormwood, that seems afraid to put forth more than a few small grey leaves, represents the vegetable kingdom in the plains of the desert region. Where the arid hills, showing horizontal lines worn by the waves of long-dried seas are visible, a few thin tufts of Alders and Poplars mark their hollows; while Willows fringe the streams of undrinkable water which courses through the valleys. A better idea of the country can scarcely be had than by imagining an ash-pit, several hundred miles across, in which a few light-grey weeds, scarcely distinguishable from the parched earth, have sprung up."

But beyond the great barrier chain of mountains lies California, the land of Oranges, Grapes, and Cereals; Southern California has, indeed, what geographers call "a Mediterranean climate," comparable with the Mediterranean region of Europe, central Chili, the south-west of Cape Colony, and the south-west of Western, and the south of South Australia. "These various regions are characterised by remarkably dry summers, but more or less rainy winters, the total amount of the rainfall, and especially of the summer rainfall diminishing as the latitude decreases." (G. G. Chisholm, M.A., B.Sc.) And now to Mr. Barr's tour and his impressions.

Of Los Angeles the tourist had not much to say, beyond stating that it was an interesting town with a very nice public park and garden, and it is surrounded by Citrus groves—the Citrus culture being a great and growing industry in this auriferous State. After Los Angeles the rail conveyed our traveller to Santa Barbara to meet his old friend Mr. Dreer, the famous seedsman and nurseryman of Philadelphia, and in his company spent a few days looking around this "American Mentone," situated on the coast plain, at the base of the foot-hills, with the Santa Ynez Mountains a little further off. Here our traveller made a diligent search for Calochortus, but owing to the extreme dryness of the season one only was found in flower, with a few scanty patches of Eschscholtzia. He spent a little time with the enterprising Dr. Franchesi, who is well known for his frequent contributions to garden literature, and who at the time was extending his culture and increasing his wonderful collection of plants, but, like most lovers of plants, was doing more for the pleasure of mankind than for his personal benefit. His daughter proved a tower of strength to our good friend in looking after the shop.

Here lives the world-known Mrs. Shepherd, in the midst of her flower garden, pushing trade with the energy and keen eye to business—a developed trait in the American character, and it is in this the Yankee leaves all creation behind. Every little advantage is taken. All the leading hotels and the railways are in league. You want to know where and how to go to a place, instead of bothering the porter or managers, you simply go to a cabinet, and there you find all the literature necessary for a tour round the world or a run to the nearest town. Most of these railway time-tables are veritable albums, with views and descriptions galore. Mrs. Shepherd had in flower the largest Eschscholtzia flower Barr had ever seen or ever expects to see unless he pays another visit to Santa Barbara. There are other specialists in flower culture besides Mrs. S. in this place, but she is the smartest by a long way. She soon makes you feel you are to do your business and go about your business.

Passing up the valley of Santa Clara, he passed through miles and miles of Prune orchards, and here also is made the famous Californian wines, "not the rubbish (to quote his own words) that comes to Britain, but the article that is sold in the United States under European names." Californian wine that is usually sold in the United States is just the same "rubbish" that comes to this country, and which is undrinkable to those who know what a really good glass of wine is. Santa Clara is also the great seed-growing centre, and hundreds of acres are under culture, much of the labour being Chinese and Japanese, the latter especially in connection with nursery work. They are handy and painstaking.

Santa Rosa is known in horticultural annals all over the world from the fame of Luther Burbank, the "Wizard of Horticulture," as his countrymen have named him. Mr. Barr describes Burbank

as a pushing, enterprising man. When the Anglo-Scot visited his garden Mr. Burbank had one Plum tree with not less than 500 grafts. With his seedling Plums, "he sows the seeds in spring; the wood is ready for grafting in the autumn, and in two seasons he has fruit." Satisfied that he has a good variety, he at once commences propagating from the wood, and the stock he will sell to any nurseryman, but failing to sell in this way, he sells the wood at so much per foot. Mr. Barr inquired whether the famous hybridiser kept one tree of every variety he introduced, but the answer was in the negative. Mr. Burbank leaves the risk to the purchaser as to the varieties retaining their characters or not.

Besides Plums, "The Wizard" works with Amaryllis and Lilies, but it did not seem to Mr. Barr that he worked on any definite lines—with Lilies at least. When the question was put as to whether he used Japanese, European, and American Lilies. Mr. Burbank replied that he did, and crossed with the whole of them. "Max Leichtlin, however," adds Mr. Barr, "doubts very much Burbank's success with Japanese and American Lilies." Immediately prior to the "Daffodil King's" visit, Mr. Burbank had signed the entire stock of the seedling Lilies to one of the eastern dealers, and many of these afterwards came to Great Britain, and from the correspondence in the gardening papers "on this side," these Lilies do not appear to have been of a specially valuable nature. On the other hand, Mr. Carl Purdy says that he saw many of them in bloom, and there were numerous fine subjects amongst them, so that (and we are using Mr. Barr's words) we may yet look for some good Liliiums from Burbank's hybrids.

Santa Rosa is another wine district, and the white wine given to our traveller at the hotel was very good, "but the red wine was vile!" Mr. Barr paid a visit to Carl Purdy at Ukiah, and learnt that this gentleman passed through his hands all the bulbs collected on the Pacific Coast, and Barr went up into the mountains where he was experimenting in Lily culture, which seems likely to provide America with good sound bulbs. All the fine Calochorti and Erythroniums (Dog's-tooth Violets) are specialised by him.

Returning southward and reaching San Francisco, Mr. Barr was much impressed with this splendidly situated city which, he says, should be viewed from the waters of the Golden Gate. (*En passant*, the Tea Rose of that name, which is creamy white, takes its appellation from this Strait.) Near the Golden Gate there is a rock covered with seals, some of them supposed to be of great age. They are carefully protected and allowed to reproduce their kind, which they do freely. This rock, its seals and the Cliff House form one of the sights of San Francisco. The magnificent park of this city was made under the direction of a Mr. McLaren, and though now planted with trees, shrubs, bulbs, &c., it has been formed out of most unpromising material. The superintendent took Mr. Barr to an elevated site, and pointed to the shores of the Golden Gate where the sand was in great straths, and liable to be blown about by the winds. Mr. Barr remarked that all that had been accomplished in the formation of the park was to cut out the roads and paths, and to retain the natural conformation of the moving sand. This was so. Mr. McLaren had found a purpose for an indigenous grass that affects this shore, by planting and sowing it over the sand to ensure the fixity of the latter. Following on this he planted trees, and in 1899 he was to put 6in of loam over the surface. The question of money never has to trouble Mr. McLaren, he having as much as he requires for his operations. The park is continually being extended, so that there is always a portion of virgin "sand" being brought under control, but the area under operation is screened off to visitors in the park, who generally do not know of the work that is being undertaken, because they see nothing of it. When a stretch of ground has been completed, the screen is carried back to the verge of the unreclaimed land.

Thus ends the American notes, for in March, 1899, Mr. Barr sailed for Japan, which country will be dealt with next.

## Gardeners' Royal Benevolent Institution.

The annual festival dinner was held in London on June 24, the Right Hon. the Earl of Warwick presiding. As usual at this great dinner, the chairman was supported by leading horticulturists from London and its environs, as well as from many parts of the country, to the number of about 160. After an admirable repast, the loyal toasts were proposed in appropriate pregnant remarks by the Earl, and the toast of the evening, that of the Gardeners' Royal Benevolent Institution, followed. The chairman observed that he highly appreciated the privilege he had, in having been asked to preside over the gathering, and, continuing, said that no one could fail to observe in the daily papers the unflagging interest in all charitable institutions for the relief of distress amongst workers in every industry which engages the people of this country. Horticulture and agriculture are closely allied, and while the latter occupies the greater share of attention, the former is growing each day. Facilities of transport are bringing to our shores the choicest and tenderest

fruits from every country in the world, and the Earl instanced a case of his own, where he had lately received from an Indian prince a present of native fruits in grand condition. Flowers and market garden produce will more and more be in demand, and the chairman thought it was a duty, therefore, to provide for the aged, needy workers in horticulture, and to keep their ease before the generous public, and gardeners themselves should discuss ways and means for augmenting the funds of the Institution. "Who are not lovers of flowers?" asked the Earl of Warwick, and added that at the christening, the marriage, the festival, the funeral, flowers have become all but a necessity; for flowers express our sympathy, as they also please the mind.

But while speaking of earth's blossoms, the Earl could not forget the articles of consumption, and he had vivid recollections of being chased round the garden of his boyhood by the old gardener with a big stick, from whose crop of luscious fruits he had surreptitiously taken his choice. And even now, when he could take them with more equanimity of conscience, he was sure he did not enjoy them less.

Readers of "Country Life" and similar journals must have often been struck with the broadness of view in matters of gardening evinced by our ancestors. He thought the popularity of horticulture likely to increase. To the great shows of the metropolis and elsewhere he need not allude, but he must draw attention to the allotment-cultivators' exhibitions, and to Lady Warwick's exemplary work in aid of horticultural and rural pursuits as a calling for women. "Lady Warwick," he said, "is trying to snatch from mere man some of the triumphs of horticulture," and none of us will begrudge what she can do in the cause to which she has set herself.

Coming to the G.R.B. Institution itself, the chairman observed that for over fifty years it enjoyed the patronage of the late Queen, and is now under the patronage of the King, Queen Alexandra, and the Prince of Wales. There are now 204 pensioners on its funds; it has annual liabilities of fully £4,000 and an assured income of only £900. All the rest of the money has to be subscribed, and it is for the augmentation of the funds that the festival meeting is arranged. The chairman further pointed to the two special funds of the Institution, the Good Samaritan Fund, and the Victorian Era Fund, the first giving assistance to the most needy applicants who have sought and the other to assist the most needy applicants who have sought or are waiting for election to the pension list. Since the foundation of the Institution in 1838, £100,000 have been distributed.

Applicants who have been subscribers to the funds have a preference over non-subscribers, inasmuch as they receive 100 votes for each year that they have subscribed one guinea. A letter from H.R.H. the Prince of Wales was then read, in which it was announced that the Prince had sent £20 to the funds, and expressing a hope that the festival meeting would be very successful. After referring to the Masonic friends which the Earl saw around him, he remarked that with so many charitable institutions throughout the country, it was necessary to discriminate in giving to them; but from his own experience, the Earl of Warwick said that every gentleman could give to the funds of the Gardeners' Royal Benevolent Institution with the fullest confidence that the money was well and wisely dispensed. He coupled with the toast the name of Mr. H. J. Veitch, who is treasurer and chairman of committee.

In his response, Mr. Veitch thanked the Earl for affording the company the honour of his presence that evening, and for the kind words which he had delivered. Mr. Veitch claimed to know something of the working of the Institution, and said that all its details were essentially good. The committee was composed of thirty-six members, one-third of whom must be private gardeners, one-third business horticulturists, and the remaining third are gentlemen who are deeply interested in the gardeners' calling. The committee is thus thoroughly representative. The rules bind the committee to meet four times each year, but so great is the work that the members meet nine times. The committee receive absolutely no remuneration.

Mr. Veitch, continuing, said that owing to the new rules, the work during the last year had been much heavier. He referred to the election of eleven Coronation pensioners, and stated that others, who had not been subscribers, but who had applied for relief, each received £5. He read letters from two old pensioners who were very thankful and appreciative for the few pounds per year awarded to them, and these letters were similar to a great many others the committee received. The Institution is in every sense a benevolent one, and in no sense a merely benefit society. Mr. Veitch mentioned that last year Mr. N. N. Sherwood presented each unsuccessful candidate with £5, as a thank-offering on his recovery to health, and twenty-nine received this amount, including eight who had never been subscribers.

The treasurer also mentioned the good work done by the auxiliaries, which yearly send up a handsome sum. The Worcester branch contributed £125, and have sent £700 since they commenced. Reading branch had come second with £117, Bristol £80, Devon £44, and Wolverhampton £25. Another source of income was the takings at Earl Ilchester's garden, which gave the funds £110. The Institution requires from £4,000 to £5,000 each year. Referring to the pensioners, Mr. Veitch drew

*Schœnia cassiniana.*

(See page 8.)

attention to an aged couple who, between them, had received £265, yet their little subscriptions had only amounted to £25. He warmly complimented the painstaking, constant labour of Mr. G. J. Ingram, the secretary, who gets overworked sometimes, but always sticks to it. In conclusion, Mr. Veitch said that the committee's great reward was in having increased subscriptions, to help the many needy cases still waiting. Lord Redesdale, Alderman Robert Piper, and Mr. A. W. Sutton also spoke to toasts. Mr. Sutton suggested that ladies should be invited to the festival dinner, and he hoped that probably Lady Warwick might be the first chairwoman. The total subscription amounted to £1,750. The tables were decorated with choice flowers from Messrs. Veitch, C. Turner, Paul and Son, Barr and Sons, Cutbush and Son, W. Leeton, J. C. Stevens, and W. Robinson.

Subscriptions were received as follows:—Prince of Wales, £20; Baron Schröder, £100; Rothschild and Sons, £105; Earl of Warwick, £25 and 3 gs annual subscription; A. W. Sutton, £50, also £20 to Good Samaritan Fund; M. H. F. Sutton, £50; N. N. Sherwood, £50; Dicksons, Ltd., Chester, £20; H. J. Veitch, £10 10s.; Mrs. H. J. Veitch, £5 5s.; J. Veitch and Sons, Ltd., ann. subs., £52 10s.; Proprietors of "The Garden" and "Country Life," £15 15s.; Thames Bank Iron Company, £10 10s.; Mrs. Alf. J. Baker, £10 10s.; per G. Monro, Covent Garden, and other friends, £85 (including Jas. Roehford, 10 gs.; J. Roehford, 5 gs.; E. Roehford, 5 gs.; J. Sweet, 5 gs.; G. Monro, Ltd., 5 gs.; Geo. Monro, 5 gs.; "J. M. S.," 5 gs.); A. McKellar, £17 17s.; R. Dean, £31 10s.; W. H. Massie (Edin.), £12 12s.; D. Fleming, £20; G. Profit, £32 10s.; G. Norman, £21; W. MacKay, £25; E. T. Cook, £7 7s.; J. Douglas, £8 8s.; W. Paul and Son, £10 10s.; James Hudson, £10 10s.; W. Thompson, £10 10s.; Barr and Sons, £10 10s.; Bailey Wadds, £27; Henry Williams, £8 18s.; L. Salomons, £21; and 5 gs from each of the following: Cutbush and Sons, H. J. Adams, E. G. Braikenwiche, W. J. Jefferies, W. Sherwood, Ed. Sherwood, R. McVitie, Lord Redesdale, A. Waterer, H. G. Cove, James Lee, R. and G. Cuthbert, W. J. Nutting, W. L. Corry, A. B. Wadds, R. Sydenham, N. F. Barnes, Bunyard and Co., G. H. Maypoek, H. J. Winsett, and G. H. Richards; and other sums making a total of £1,750.

#### Pot Vines at Cardiff Castle.

Wending my way into these gardens a few days ago, reflecting on their former glory and pleasant associations, and, alas! on the now changed scene, I recounted the many cultural triumphs of our late and much lamented friend, Mr. Pettigrew—his wonderful Melon crop, his many new varieties raised, his Cardiff Castle Cucumber, his magnificently trained fruit trees, each monuments to his method and skill. Above all, he had extraordinary success with pot Vines, grown into fruiting condition in one season, and always laden heavily with bunches of the finest description. This season the pot Vines are again excellent, thanks to the practical care of Mr. Farmer, who, as foreman, was for several years Mr. Pettigrew's right hand, and especially so during the latter part of his long and painful illness. This success reflects great credit on Mr. Farmer, who remains in charge of the gardens for the present. The varieties grown are Black Hamburgh, Alnwick Seedling, Foster's Seedling, Madresfield Court, Black Alicante, and Black Morocco, the latter particularly good, and all were carrying nine to twelve bunches each of more than average weight. Last year Mr. Pettigrew grew Diamond Jubilee and fruited it well, but was not pleased with its quality. Whilst sincerely lamenting the loss of our genial friend, the thought would occur, that the fates had been kind in sparing him the pain of beholding the ruthless demolition of much of his life's labours, for it is to be feared that the gardens are doomed to make way in the near future for the utilitarian demon in the garb of bricks and mortar.—L. ARDAITH.

#### Aubrietias.

For the rockery, or for edgings to paths, Rock Cresses are valuable plants, and also for spring bedding they make a gay display during April and May, and even well into June were they required. Thanks to the enterprise of several persons, we have now much variety to choose from; new and distinct colours are now taking the place of such sorts as *deltoidea*, which is no doubt the parent of many. A. Dr. Mules is, in my opinion, quite the best of the dark purple varieties; it is a distinct improvement upon A. Hendersoni, being deeper in colour and more compact in growth, exceptionally free flowering. This is quite a gem. A. Moerhemi is a distinct break in colour, being a deep rose pink. When first expanding the colour is quite pale, one might almost describe it as "washy," but if one waits to see the blossoms fully developed it is quite another thing. I think this has been the cause of some writers' disparaging remarks—a too early opinion. The growth is vigorous, the foliage being of a glaucous tint. Another point, too, in its favour is the length of time the flowering season extends.

A. Fire King has, perhaps, the brightest colour of all—glowing crimson. It, too, has the merit of lasting a long time in flower. In growth it is vigorous. A. Leichtlini deserves a position in every collection; its colour—bright rose—quite enlivens that part of the garden in which it grows. The habit of growth is compact, while its freedom in flowering cannot be excelled. A. Souvenir of Wm. Ingram has larger flowers than the foregoing; the colour is rose pink, changing to pale blue, with paler centre markings.

A. Campbelli (syn. Hendersoni) is a rich violet purple, the blooms are exceptionally large. The growth is rather straggling, in other respects worthy of a place in any collection. The new varieties, Bridesmaid and Lilac Queen, raised and distributed by Messrs. Barr and Sons at their Ditton Hill Nurseries, are a distinct gain; the former soft blush, and the latter a soft shade of lilac. Aubrietias are easily propagated. Where a sufficient stock is available, to get quickly good plants for flowering the following season, division of the roots is a good plan. Directly flowering is past cut away all the flowering shoots and pull the roots in pieces, and plant them in sandy soil to which is added leaf mould freely. Choose a northern aspect, as this site dispenses with the necessity to shade daily should the weather be hot and dry. The more scarce varieties should be increased by cuttings taken off now and inserted in sandy soil in a cold frame.—E. MOLYNEUX.

#### Veronica spicata.

Though most gardening books seem to omit this species from their lists, it is nevertheless a desirable plant and said to be a native of Britain. The illustration on page 15 portrays the habit and free-flowering character of the bush, covered with its dense spikes of blue flowers. It is a dwarf grower 1½ ft to 2 ft, and is mainly to be commended for the rock garden. Our photograph comes from Mr. C. Jones, of Ote Hall.

#### Schoenia cassiniana.

This is a pretty greenhouse annual, a Composite, with pink and rose flowers, borne in umbels. These are of the "Immortelle" type (i.e., "Everlasting"), as the plant is a native of the drier regions of the Swan River, W. Australia. Schoenia is nearly allied to Helipterum. An award of merit was given to Hurst and Sons, 152, Houndsditch, E.C., when they staged plants of it before the Floral Committee of the Royal Horticultural Society on June 9.

#### New Calceolarias.

Writing from Udston, Hamilton, N.B., Mr. D. Chisholm (in sending flowers) says:—"No. 1 Calceolaria: This is a cross between Dalkeith strain herbaceous Calceolaria and Golden Gem hardy shrubby Calceolaria. The latter was the seed parent. The cross is well suited for bedding, both the foliage and flowers are more attractive than the seed parent."

"No. 2 Calceolaria: This is a cross between No. 1 and Veitch's finest herbaceous strain, the former being the seed parent. There were many colours, but this is the best formed and marked. It takes the character of the seed parent in the foliage, which is robust and abundant."

#### A New Strawberry Fiend.

One becomes so accustomed to the visit of the common thrush and blackbird at Strawberry time that they are expectant and realised troubles, and thus always provided for. This year these birds had hardly made their presence felt, the abnormally wet and rainy time providing abundance of worms, which is the natural food of both thrushes and blackbirds, when the small brown linnet made raids on the forwardest berries. This is a new trouble, and one not so easily dealt with unless smaller meshed nettings are employed. Ordinary fish nettings purchased for the protection of fruit avail nothing for the brown linnet, they pass through the meshes almost as easily as though they were not present.

The brown linnet has up to now been regarded as one of the few of the gardener's feathered friends. They have even been encouraged here in their nesting, for which purpose the Gooseberry bushes afford them ideal spots. Being mostly seed-eating birds, they do much good among many noxious weeds, and usually here they are seen only in the spring and early summer. I can only remember one season when they were a trouble to the seed beds; then, as if to meet the exigencies of season, they stepped in to replace the absent chaffinch. Bird life has apparently not that uniformity of habit one is inclined to accredit to them—at least, I have found from year to year that though by common consent they claim certain crops as part of their diet, they evidently do not bind themselves to anything that would imply etiquette in custom or season.

Most growers are acquainted with the worthlessness of Strawberries attacked by mice. The surface of the fruit is simply peeled off by the removal of the seeds. Exactly the same appearance is given to the fruit after the linnet has adapted the seeds to his purpose, and I note they are not so particular about the perfect ripeness of the berry. Probably the nature of the season accounts for these vagaries of bird life. It cannot be the absence of weed seeds that accounts for the linnet freak, for everywhere just now the weed trouble is in the ascendant as an element of controversy. It would be interesting to know from other readers whether this new addition to Strawberry connoisseurs is giving similar experience elsewhere.

It is regrettable always to have to destroy birds that may do so much good in their own way, but when their numbers increase as they do so plentifully, given unmolested breeding accommodation, it soon develops into a serious question when they take to a new custom like that of fruit eating. They are not in the least shy, but will come almost within arm's length and help themselves in spite of net coverings. In a similar manner bullfinches will take a fancy to Raspberries in some, though not in every, year, and in town gardens the starling is an equally dreaded robber.—W. S.

### Gardeners' Commissions.

I enclose herewith slip which has been received by me inside a foreign catalogue of bulbs. I have noted with interest the correspondence which has taken place in your paper relative to gardeners' commissions, and it appears that on this question probably firms in this country are being fathered with the sins of foreigners if the enclosure is to be taken as an instance. With the Bill before Parliament it occurs to me as to how the point of the foreigner offering discount is to be met with, as obviously to prevent corruption (so called) by English firms, some means should be adopted for this to apply to foreign firms; if it is not so it would be a very anomalous position. This does not appear to have been dealt with in any correspondence hitherto appearing, and I think it is a point which deserves consideration.—MONITOR.

### Back to the Land.

Taking it for granted that "D. C." is speaking from actual experience of unsuccessful holdings, I must confess that mine is entirely confined to the Evesham district of Worcestershire, where small holdings are the rule, and where they are ousting the farmer every year. But there must be the right stamp of men, and they are not produced in six months, and scarcely in one generation. Farm land is every year turned into allotments in this neighbourhood, and rents are at once raised, out of all proportion. My contention was that past laws and conditions have favoured the creation of large holdings, and thus indirectly helped to drive labour townwards. Large holdings cannot afford to pay high wages; for intensive cultivation, wherever you find it, has to pay these higher wages, and then the labourers do not go to the towns to the same extent, and fewer still would go if they could purchase their own holdings. Did "D. C." ever hear of a man owning and working three or four acres who left it to better himself in a city? There must be something strangely wrong if, as "D. C." says, men leave the land—the first source of production—to avert starvation. It would not be safe to offer free land near here. I cannot speak for other parts, and it has to be very foul and very poor to be had rent free for even six months. I quite agree as to the difficulties of distribution when distant from any outlet. I can give no figures to prove that small holdings *do* pay, nor do I believe that any are needed. I live in the midst of it, see it spreading every year, and paying quite double farmer's rent and higher wages, and so am convinced that it *must* pay. That it would thrive equally in every part of England is my firm belief; but you must have the right men, as I said before, and they can only be produced gradually. Thanking you for your kind allowance of space, on which I shall not again encroach, I am, &c.—OWNER AND TENANT.

P.S.—Would "D. C." explain why Henry George's philosophy would, if practically applied, tend to national suicide?

### ENTERING A HOLDING OF SIXTEEN ACRES.

Writing in reply to a query in "Farm, Field, and Fireside," a correspondent signing himself "Wentworth," says: "If there is still money to be got from the source from which you acquired the £200 you have to start your farming with, stick to it, for you will never keep a wife and family and save £200 out of farming sixteen acres of land in West Yorkshire, when devoting your energies principally to summer butter making. In an issue of the 'Mark Lane Express' there appears a letter from Mr. Clare Sewell Read on 'Co-operation Among Farmers,' and he quotes the caution of the late Charles Howard, 'That the only way for a small farmer to command success was to do the work of two labourers and live at the expense of one.' This is quite our experience, and this is the sort of life that the small holder has got to be prepared for. One of your proposals, on the strength of your wife being a good butter maker, is to purchase four cows at their second calf in May, and get your butter in the summer, as you do not think it pays to make butter in the winter. This argues more faith than experience. It does not pay to make butter in the summer, and least of all from ordinary second calf cows, unless it can be sold at top prices to private consumers. We have seen in Yorkshire markets, in Otley, Ripon, and Knaresborough, butter sold at 8d. per roll, and a roll of butter in Yorkshire is a pound and a half. Can that pay? Unless a man works for a larger farmer, and slaves

at his small holding after his day's labour, and between times, or unless it is situated near a town, and is cultivated principally as a market garden, and all produce—vegetables, butter, poultry, eggs, pigs, &c.—is sold at retail rates, there is no "living" for a man and his wife and family off sixteen acres of land. It is slavery and semi-starvation. It would pay better to rear and sell fresh calves, in view of the demand for such by Lancashire milk sellers in West Riding markets than to make butter under the conditions described, and it would pay better to follow your present occupation, or seek almost any other than a farmer of a small holding."

If this is reliable advice, it contains a serious warning. Another writer to the same query says: "Selling farrows of pigs at eight or ten weeks old will be sure to pay you. Better to hire horse work done. Fields that are grazed will not need dressing, but the mowing ground will. Good extra foods for butter production are oats, bran, maize, meal, brewers' grains, cotton cake, linseed cake, carrots or parsnips, and mangold; the latter at spring, but, of course, not much, if any, of this kind of dieting is needed in summer time."

### Jottings on the Holland House Floral Fête.

Doubtless the readers of our Rose Journal will have a full account of the splendid exhibition of the Royal Horticultural Society's exhibition held last week in the lovely and extensive grounds at Holland House, generously lent by the Earl of Ilchester. It is the humble object of your correspondent to confine his few remarks to the Rose division. Regretfully, but not, as a matter of surprise, he is obliged to come to the conclusion that the Roses, neither in numbers or quality came up to the mark or were worthy of the occasion. Thirteen frosts, consecutively, up to April 27 one has only to mention as the chief reason. Nevertheless, among the blooms staged many were exceptionally fine. Of the two new light Roses, a snow-white H.P., Frau Karl Druschki ("made in Germany") and H.T. Mildred Grant (Dickson, Belfast), collections of twelve, each of which created so great a sensation at the Hereford and West of England Rose show last year—the former was badly shown, the latter by a superb specimen in Messrs. Frank Cant and Sons' first prize collection. There is evidently a great future for both these varieties, one professional exhibitor expressed his intention of working 10,000 on the Briar of Frau Karl Druschki, so highly did he think of it. Probably from its strong growth—like H.P., Her Majesty—this variety will do better on "cut-backs."

In the first and second prize Colchester collections (forty-eight varieties) the following blooms were admirable:—The new Rev. Alan Cheales (globular, very good), Comtesse de Ludre (splendid), Margaret Dickson (large, without coarseness), Caroline Testout exquisite (a variety supplanting La France as a breeder), Dr. Sewell (superb colour), W. F. Bennet (plum coloured), Marchioness of Downshire (fine, exquisite in several collections), and the new President Carnot (fine, with high centre), Lady Roberts (new and promising, but shown coarse), Ulrich Brunner (magnificent), Captain Hayward (grand colour, generally bad traveller, but here wore well), Frau Karl Druschki (badly shown), Marchioness of Lorne (finely cupped, very promising), Mrs. J. Laing (superb, as usual), Mrs. Rumsey (good), Duke of Edinburgh (grand in size and colour), and Lady Battersea (useful colour, evidently not shown in form).

Messrs. Prior had a nice first prize collection of eighteen Teas, chiefly noticeable: Madame Hoste, Souv. de S. A. Prince, and Catherine Mermet (fine blooms); while in Messrs. Prince, Oxford, the new Tea, Souvenir de Pierre Notting was admirably shown, and will be a great acquisition. Neither this celebrated firm nor my friend and late neighbour, Mr. Burnside, seem to have as yet overcome the delays and difficulties of the season. As regards the new dark H.P., Edward VII., from specimens sent both in a bud and growing state, it is premature to decide; the habit of growth is first rate, but whether blooms will not be rather obtuse in petal, and pretty but lacking in size, remains to be seen; the colour is rich and good.

Messrs. Hobbies staged Rambler Dorothy Perkins to great advantage. This novelty was universally admired for colour and freedom of blossom and growth.—HEREFORDSHIRE INCUMBENT.

### Slugs and Orange Peel.

In regard to your par re above in "Our Journal" of June 25, I have tried it on several occasions with great success. I have also found that Lemon peel is just as efficacious. Having caught scores of slugs in this manner I would recommend all gardeners who are troubled with the pest to give this simple remedy a trial.—E. M. E., West Kensington.

## Societies.

### Yorkshire Gala, June 24th, 25th, and 26th.

This exhibition, the forty-fifth in succession, was held in Bootham Park, York, on June 24 and two succeeding days. The exhibits this season were slightly fewer than usual, owing to the very untoward season, but the show was still most attractive, and on the opening day was favoured with ideal weather. Arranged in five large tents opening into one another, the show was a most effective one, and arranged in such a way as to reflect much credit on the management, and especially to the exertions of Mr. Fred Arey, the energetic and courteous secretary, who did everything possible for the convenience of exhibitors and competitors.

#### Plants.

**Groups.**—The leading feature of the plant classes was the competition for groups, the prize being for a group of plants in or out of bloom, arranged for effect, space not exceeding 300 square feet. There were five competitors, all of very equal merit, and all most meritorious. The designs of the whole were most similar, differing only in detail, and while all had grace and effectiveness, it is regrettable that in every case the same general plan was followed, and it is to be hoped that the limit of design in plant arrangement has not been reached. The plants used, generally speaking, were of much merit. Palms were in fine health and appropriate in size to the general design. Crotons were beautifully coloured. Variegated Abutilons were most graceful and effective; Acalypha tricolor was also prominent and beautiful among flowering subjects. Liliun longiflorum was largely in evidence, and several of the groups were rich in cut stems of Odontoglossum crispum. The judges had a hard task in deciding, where all were good, and spent a very long time over their task, the first prize being eventually awarded to James Blacker, Esq., Selby (gardener, Mr. W. Curtis); second, Mr. J. S. Sharp, Almondbury, Huddersfield; third, Messrs. Artindale and Son, Sheffield; and fourth, E. B. Faber, Esq., M.P., Harrogate (gardener, Mr. W. Townsend).

**SPECIMEN PLANTS.**—In the open classes for twelve, six, and three plants in bloom, Messrs. Cypher and Son, Cheltenham, were easily first with beautiful examples from their well-known collections, prominent being beautiful plants of Statice intermedia, Ixora Williamsi and salicifolia, Bougainvillea Cypheri, Ericas Bothwelliana and Candolleana, Dracophyllum gracile, &c. Col. Harrison, Broadley, was second, for twelve plants, and was the only exhibitor for six specimens open to amateurs only. For one specimen greenhouse plant (open) there were ten entries, the first prize again going to Messrs. Cypher with a grand specimen of their Bougainvillea. In the classes for fine foliaged and variegated plants, Messrs. Cypher held leading position, with fine, healthy, well-cultured specimens, their Crotons being very rich in colour. Messrs. Sharp and A. F. Faber were also very meritorious exhibitors in these classes.

**ORCHIDS.**—Of these there was quite a brilliant display, which formed a most attractive feature of the exhibition. In class 19, for table of Orchids arranged for effect, either dwarf plants, cut blooms in glasses, or baskets admitted, there were two entries. Messrs. Cypher and Son gained the first prize with a very rich and massive exhibit, containing beautiful examples of Cattleyas, Cypripediums, Odontoglossum crispum, Brassavola Digbyana, &c. The arrangement of this was very fine, but slightly heavy. Mr. John Robson, Altrincham, was second with a very elegant exhibit of similar sorts. Some onlookers favoured this exhibit for first prize, but elegance had to give place to massiveness. For ten specimen Orchids, Messrs. Cypher were easily first with very fine plants, chief among them being Cattleyas Warneri, Mossiae, gigas, and Mendeli, Brassavola Digbyana, Lælia tenébrosa, Odontoglossum citrosum. Mr. Robson was again second, and W. P. Burkinshaw, Esq., third. For six Orchids and three Orchids Messrs. Cypher and Mr. Robson were again first and second respectively. In the amateur classes for six and three Orchids the first in both cases was gained by Walter Bateman, Esq., Leeds (gardener, Mr. J. Rollison); and second W. P. Burkinshaw, Esq., Hull (gardener, Mr. Barker). For four Orchids (Messrs. Backhouse's prize), Mr. Burkinshaw was first and Mr. Bateman second.

**PELARGONIUMS.**—For Zonals and Ivy-leaved varieties there were good competition, but the classes for stage Pelargoniums, which used to be a great feature at York shows, did not fill. The bank of Zonals were an effective blaze of colour, but the plants grown on the flat pancake system with blooms all tied to a uniform level, we did not admire. The leading prizes were gained by Mr. Henry Pybus, Leeds, and Mr. J. Sunley. The Ivy-leaved varieties were more naturally grown.

**BEGONIAS.**—There were six groups, 12ft by 5ft, interspersed with foliage plants; these were pretty and effective. Mr. F. Styan, York, gained first prize with a very pretty exhibit of choice blooms, Miss Wharton was second, and Messrs. Walshaw and Son third. There was also a good competition for eight specimen Begonias.

Groups of Carnations were well shown, Malmaison varieties

being much in evidence. Mr. Robson was first, Mr. Barker (gardener to the Duke of Newcastle) second, and Messrs. Walshaw third. There were good classes for groups and specimens of Fuchsias (very good), Gloxinias, Calceolarias. The prize for group of Cannas had only one entry, Messrs. Walshaw, but they were very creditable and showy. Ferns and table plants were well shown.

#### Roses.

Great hopes were expected this season of a fine display of Roses, and most liberal prizes were offered, but the season proved so bad that the efforts of the committee were practically abortive. Both southern and northern growers were disappointed, those in south preferred to exhibit at Holland House, while northern growers had none to show. For groups of Rose plants there were three fair collections, arranged too closely to show well. Mr. Pybus, Leeds, was first, and Mr. Hutchison, Kirbymoorside, second.

In the cut bloom classes Mr. Geo. Mount, nurseryman, Canterbury, saved the Rose section from failure, and took the first prizes for seventy-two blooms, also for forty-eight, thirty-six, twenty-four, and eighteen blooms. His blooms generally were not large, but fresh and well coloured, the most prominent varieties being Ulrich Brunner, Liberty, Général Jacqueminot, Captain Hayward, Mrs. W. J. Grant, Mrs. John Laing, Mrs. Sharman Crawford. Messrs. Harkness and Co., Hitchin, were second in these classes with blooms much below the first prize stands in quality. Among other

#### Cut Flower Classes.

those for hardy border flowers were most prominent, and were a leading feature of the exhibition. For collection of hardy cut flowers, 15ft by 6ft, Messrs. Harkness, Bedale, were first, Messrs. Gibson and Co., Leeming Bar, second, and Messrs. Harkness and Co., Hitchin, third. These were most effective exhibits, containing the leading hardy flowers now in bloom: Pyrethrums, Iris, Poppies, Campanulas, Heucheras, Pæonies, &c. For twenty-four bunches hardy flowers Messrs. Gibson were first, and the two firms of Messrs. Harkness second and third. For twelve bunches hardy flowers (amateurs) good exhibits were from Mr. Hutchinson, Mr. McIndoe, and Mr. Whitehead.

Sweet Peas had only two exhibits for twelve distinct varieties—both very good. Mr. Geo. Cottam, Cottingham, was first with very good examples, the most prominent being Gorgeous, Aurora, Countess of Radnor, Lovely, Blanche Burpee. Mr. McIndoe was second.

#### Bouquets and Floral Decorations.

In the bouquet classes the veteran prizetakers, Messrs. Perkins and Son, of Coventry, had a very easy task, capturing all the first prizes in a walk. The two bride's bouquets were exceedingly elegant with their wealth of Alexandra Orchids. The pair with Odontoglossums and Cattleyas were also very beautiful. Messrs. Artindale and Son, Sheffield, had all the seconds; their bouquets were composed of fine flowers, mostly Orchids, but sadly lacking in artistic finish; some of them so unfinished in the handles that they should hardly have been admitted to the prize list. Competitors should bear in mind that an unfinished bouquet is not a bouquet. For baskets of flowers Messrs. Perkins were again easily first, the basket of Roses being a dream of fragrant beauty. Messrs. Artindale were again second, their baskets showing the same faults as their bouquets. For a table of floral designs there was only one entry, which was very flatteringly dealt with when the judges awarded it a second prize. A vase or epergne for decoration of dinner tables brought out five competitors, Miss Ada Stanley, Didsbury, getting first award with an elegant and certainly simple arrangement of Iceland Poppies and Gypsophila.

#### Fruit and Vegetables.

The principal prize was that for a decorated table of ripe fruit, not to exceed fourteen dishes, or have less than ten. For this there were five competitors, and as they were all highly meritorious and beautifully decorated, they formed both a pleasing and important feature of the exhibition. As the judging was by points, to be placed on each exhibit, the judges spent a long time over the different exhibits before making the final awards. The first prize was awarded to Lord Barnard, Raby Castle, Darlington (gardener, Mr. J. Tullett), with a total of 104 points—82 for fruit and 22 for floral decoration. Mr. Tullett had very handsome, well-finished Hamburg Grapes, a beautiful Pine, two Melons, splendid Nectarines, good Peaches, Figs, Apples, &c. The second place was awarded to the Earl of Harrington (Mr. Goodacre, gardener), Elvaston Castle, with a total of 99 points—75 being for fruit, and 24 for flowers (the maximum). Black Grapes were very fine. Hale's Early Peach and Early Rivers Nectarine were also choice. Third place fell to Mr. J. McIndoe, Hutton Hall, with 91 points—76 for fruit and 15 for flowers. Mr. Dawes, gardener to the Hon. Mrs. Ingram, had also a very meritorious table, the floral decorations being, perhaps, the finest of the lot, and more nearly approaching the decoration of a real dinner table in contrast to one for exhibition—one or two tables being slightly overdone. Mr. Dawes' centre of Alexandra Orchids were, perhaps, the finest thing in the show.

Tea-scented Roses. (See page 4.)

For the collection of ten kinds Lord Barnard, Raby Castle, was again first; second, the Hon. Mrs. Ingram (Mr. Dawes, gardener); and Mr. Corbett, Droitwich (gardener, Mr. Jordan), third. For collection of six dishes, first prize was awarded to Lady Beaumont, Carlton Towers (Mr. W. Nichols, gardener), for a very fine exhibit, the Grapes being very good indeed. Second, Mr. Corbett; and third, Earl of Londesborough, Market Weighton (Mr. J. McPherson, gardener). For four dishes, Lord St. Oswald, Nostel Priory (Mr. J. Easter, gardener), was first, Earl of Londesborough second, and Mr. J. McIndoe third.

Other fruit classes were well competed for, notably that for three bunches of Black Hamburg Grapes, there being no fewer than twelve entries, the prizes were as follows:—First, the Duke of Newcastle (gardener, Mr. S. Barker), Clumber; second, Lady Beaumont; third, A. Wilson, Esq., Tranby Croft (J. P. Leadbetter, gardener); fourth, Lord St. Oswald—the quality of these was very superior.

**VEGETABLES.**—There were only two classes for vegetables, the prizes being offered respectively by Messrs. Sutton and Sons, Reading, and Messrs. Webb and Sons, Stourbridge; the first and second prizes being in each case gained by Lord Aldenham, Elstree, Herts (Mr. Beckett, gardener), and the Earl of Lathom, Ormskirk (Mr. Ashton, gardener), the quality of the whole was good; but these special prizes tend to narrow competition.

#### Non-competitive Exhibits.

The trade made a good display, a number of most interesting exhibits being made, though in some seasons the nurserymen have been forward in larger numbers. The largest group was from the well known nurseries of Messrs. Smith and Co., Worcester, and contained some beautiful specimen Clematis, a great speciality with this firm: they had also a large collection of miscellaneous house and hardy plants, and a showy and interesting collection of cut hardy border flowers; a gold medal was awarded.

Messrs. Kent and Brydon, Darlington, exhibited a very handsome and well arranged collection, prominent among which were pretty and effective masses of Verbena Miss Willmott, Gladiolus The Bride, Malmaison Carnations, Hydrangeas, Rhododendron John Walter (very bright). A special gold medal was awarded.

Messrs. Mack and Miln, also of Darlington, had a very effective group containing many interesting plants, but specially prominent were Malmaison Carnations, Kalosanthes, Abutilons, Dracenas, &c., beautifully set off with choice Bamboos and Palms. Gold medal was awarded.

Messrs. Wm. Clibran and Son, Altrincham, had a small but beautiful group containing many interesting plants of a newer and rarer description, including Kalanchoe flammea, Verbena Miss Willmott, new blue Marguerite Dimorphotheca Eckloni, the Old Man Cactus, Crossandra undulifolia, Asparagus myriocladus, Eucharis Clibrani, Lobelia Mrs. Clibran, &c. Silver medal.

Messrs. Dicksons, Limited, Chester, had a large and beautiful display of hardy cut flowers, containing Ixias (very handsome), Paeonies, Iris, Poppies, Anemones, Heuchera micrantha, Lilium rubellum, &c. Gold medal awarded. Messrs. W. and J. Brown, Stamford, a table of miscellaneous flowers, among which bedding Cactus Geranium Fire Dragon was prominent (very bright in colour and dwarf in habit). Messrs. Cutbush and Son, Highgate, had a group of new white Anemone-flowered Marguerite Coronation, which has a very handsome appearance. Messrs. Waltham, Scarborough, showed a group of their new yellow Marguerite Golden Sun, which blooms very freely and has a good branching habit; Heliotrope Lord Roberts was also good in this exhibit.

A most interesting exhibit was made by Geo. Yeld, Esq., of hybrid and cross-bred Iris and Hemerocallis, many of which were very beautiful and attracted great attention from plant lovers.

Messrs. Reamsbottom and Co., King's County, Ireland, made a very beautiful exhibit of their famous strain of St. Bridgid Anemones, for which they were awarded a gold medal.

First-class certificates were awarded to Mr. Brotherston, gardener to F. A. E. Sanderson, Esq., Brackenbrough Hall, for a very handsome terra cotta Carnation Francis Samuelson. This seems a most promising variety, possessing nearly all good points, with a most attractive colour. Also to W. P. Birkinshaw, Esq., for a seedling Thunia.

### Royal Horticultural, June 25th and 26th.

The second summer show held at Holland Park, by kind permission of Earl and Countess Ilchester, was successfully recorded on Thursday and Friday of last week. The weather was typically that of summer, and large numbers of visitors attended. The gardens of Holland House were open to the public on payment of 1s. fee, the money going to the gardening charities. The show arrangements were again in the hands of the secretary, Rev. W. Wilks, M.A., Mr. S. T. Wright, Mr. Reader, and Mr. Humphreys, who were assisted by the office and garden staffs.

#### Orchids.

Jeremiah Colman, Esq. (gardener, Mr. W. Bound), from Gatton Park, brought a select group of Cattleyas, Odonto-

glossums, &c. His *Laelia cinnabarina* were very well flowered, and *L. purpurata* could hardly have been beaten. Messrs. Low and Co., of Bush Hill Park, Enfield, contributed *L.-c. Latona*, *Cypripedium Alice*, a lovely flower; *Dendrobium Bensoniæ* xanthinum, *Cattleya Mossiæ* Reineckiana, and other choice subjects. Messrs. B. S. Williams staged a small group, as also did Charlesworth and Co., of Bradford.

#### Fruit Exhibits.

Hugh Low and Co., Bush Hill Park, staged fruiting pot Vines and Figs; while Messrs. Rivers and Son had their unsurpassed trained pot Peach and Nectarine trees, and also Cherries.

An excellent Queen Pineapple came from Baron Rothschild, Hohe, Warte, Vienna (gardener, Mr. W. J. Roberts). Seedling Melons were sent up from the Swanley Horticultural College, but these were not certificated. Leopold de Rothschild, Esq. (gardener, Mr. J. Hudson), contributed Jefferson, Kirke's, Transparent Gage, and the early variety of same, also Reine Claude de Comte Althann Plums, the fruits perfect, even in a bad year. A dish of Cherries came from the Countess of Portsmouth, Hurstbourne Park.

#### Roses.

Thomas S. Ware, Limited, brought a group of pot Roses, including Sunrise, Corallina, Bessie Brown, and a large selection of the favourite varieties in all sections.

Mr. Geo. Mount, of Canterbury, also added to the Rose display with a well grouped collection of pot plants and cut blooms, all of the leading popular sorts. Mr. Geo. Prince, of Longworth, staged Paul's Carmine Pillar Rose, Aglaia, Bellefleur, and others. Messrs. Paul and Son, of Cheshunt, had a group which included their new Lady Battersea, rugosa repens alba, Dawn (H.T.), and others. Another Rose contribution came from Chas. Turner, who had mostly standard hybrid Wichuraiana varieties, and numerous bunches of Garden Roses.

#### COMPETITIVE ROSE CLASSES.

The premier class for Roses was that for twenty-four single blooms, but sad to relate, there were only two entries, Mr. C. J. Salter, gardener to Mrs. Haywood, Woodhatch, Reigate, being placed first. The best varieties were Clara Watson, Crown Prince, Madame Lambert, White Lady, Captain Hayward, Cleopatra, and Madame Hoste. Mr. Alex. Hill Gray was second, relying solely upon Teas and Hybrid Teas, which were certainly below Mr. Hill Gray's average.

In the class for twelve distinct blooms there were four competitors, but Mr. O. G. Orpen, West Bergholt, Colchester, came out first. His varieties were La France, François Dubreuil, Bessie Brown, Maman Cochet, White Maman Cochet, Madame Ravary, Antoine Rivoire, Mrs. W. J. Grant, Mavourneen, Rainbow, Souvenir d'un Ami, and Madame Jules Grolez. The second prize went to Mr. S. B. Gabriel, Hart Hill, St. John's, Woking, who exhibited in much weaker form.

For six blooms of one variety there were three competitors, and Mr. Chas. Lamplough, Chatteris, Cambs., secured premier position with Mrs. W. J. Grant, which were good, followed by Mr. O. Orpen with La France, which appeared equal to the first prizewinners.

In the open class for forty-eight blooms, distinct, no less than four exhibitors faced the judges. Messrs. F. Cant and Co., Colchester secured first prize; the varieties were Oscar Cordell, Merveille de Lyon, Rev. Alan Cheales, Ulrich Brunner, Caroline Testout, Mrs. J. Laing, White Lady, Duke of Edinburgh, La France, Lady Mary Fitzwilliam, Mrs. R. G. Sharman Crawford (good), Antoine Rivoire, Liberty, Viscountess Folkestone, Marchioness of Downshire (fine), Madame Jules Finger, Marquise Litta, Frau Karl Druschki, Bessie Brown, Captain Hayward, Lady Roberts (in fine form), Baroness Rothschild, Mrs. W. J. Grant, Mrs. Rumsey, Rainbow, Exquisite, Tennyson, Mrs. J. Cocker, Souvenir de President Carnot, Chas. Lefebvre, Comtesse Beatrix de Biserat, La Frachier, Mildred Grant, Marchioness of Lorne, Margaret Dickson, Général Jacqueminot, Clara Watson, Etienne Levet, Dupuy Jamain, Lady Battersea, Rubens, Mrs. F. Cant, Marie Baumann, Charlotte Guillemot, Gladys Harkness, Madame G. Luizet, Madame Jules Grolez; and Messrs. D. Prior and Sons followed with some good representative flowers of La France, Mrs. J. Laing, Mrs. W. J. Grant, Rubens, Antoine Rivoire, and Madame Jules Grolez.

The class for eighteen single blooms of Teas and Noisettes, not less than twelve varieties, brought out two competitors, Mr. A. Hill Gray, Beaulieu, Bath, being first with a nice exhibit. His varieties were Mrs. E. Mawley, The Bride, Catherine Mermet, Comtesse de Nadaillac, Golden Gate, Maman Cochet, Medea, Hon. E. Gifford, Bridesmaid, Alba Rosea, White Maman Cochet, and Souvenir d'Elise Vardon; Mr. O. G. Orpen must have been a desperately close second, for there appeared nothing between them. His best blooms were Muriel Grahame, Maman Cochet, Souvenir de Thérèse Levet, and White Maman Cochet.

In class 6, for twelve blooms, not less than nine varieties, Mr. T. B. Gabriel was the only competitor. The varieties were Anna Olivier, Muriel Grahame, Golden Gate, Maman Cochet, White Maman Cochet, Rubens, Comtesse de Nadaillac, Niphotos, Souvenir de S. A. Prince, and Catherine Mermet.

Class 7 was for six blooms, one variety, and there were three entries. Mr. O. Orpen taking first prize with a good box of White Maman Cochet, the Rev. F. R. Burnside, Great Stambridge, was second with Souvenir d'un Ami.

For eighteen single trusses, distinct, there were two competitors; Messrs. D. Prior and Son leading with a strong exhibit. The varieties were Souvenir de S. A. Prince, Cleopatra, Marie Van Houtte, Princess of Wales, Niphetos, Medea, Bridesmaid, Princess Beatrice, Luciola, Comtesse de Nadaillac, Devonensis, Catherine Mermet, The Bride, Anna Olivier, Madame Hoste, and Empress Alexandra of Russia. Mr. Geo. Prince was second with nice blooms of Comtesse de Nadaillac, Souvenir de P. Notting, and The Bride.

For eighteen bunches of Garden Roses Mr. O. G. Orpen was the only competitor: his varieties were Claire Jacquier, Reine O. de Wurtemberg, Stanwell Perpetual, Marie Pavie, Hebe's Lip, The Garland, Double Blanc de Coubert, Mavourneen, Madame Plantier, Laurette Messimy, Wichuraiana, Gardenia, Lady White, Alistair Stella Grey, Janet's Pride, Fimbriata, and Bardou Job.

There were three competitors in class 10 for twelve bunches of Garden Roses; Messrs. Paul and Son, Cheshunt, being first with Souvenir de C. Cochet, Madame G. Bruant, Rose Apples, Conrad F. Meyer, Madame Chas. Wroth, Mikado, Blanche Double de Coubert, Rugosa Alba, Rugosa, Mrs. A. Waterer, and Austrian Copper. Messrs. F. Cant and Co. followed with a weaker display, the best being Madame G. Bruant, Fimbriata, and America.

The class (9B) for thirty-six bunches of Garden Roses made a fine display. There were three entries, and Messrs. F. Cant and Co. proved the winner with a really fine exhibit. The varieties were Dundee Rambler, Reine O. de Wurtemberg, Lucida plena, Harrisoni, Bardou Job, Gardenia, Madame d'Arblay, Claire Jacquier, Camoens, Marquise de Salisbury, Rosa Mundi, Una, Lady Battersea, Braiswick Fairy, Liberty, Madame C. Guinoisseau, Souvenir de J. B. Guillot, Ma Capucine, Corallina, Laurette Messimy, Rainbow, Souvenir de C. Guillot, Princess Bonnie, Madame P. Ducher, Papa Gontier, Hebe's Lip, Léonie Lamesch, Madame J. Grolez, Cecil Brunner, Fabvier, Madame Falcot, Marguerite de Simone, Raoul Chauvry, Madame L. Poncet, Gustave Regis, and Common China. The second prize fell to Messrs. B. R. Cant and Sons, Colchester, whose best bunches were Grace Darling, Souvenir de Catherine Guillot, Madame P. Ducher, Papa Gontier, and Lady Battersea.

There were five entries in class 11 for twelve bunches of single Roses, Messrs. B. R. Cant and Sons, Colchester, being placed first with a good level exhibit. The varieties were Amy Robsart, Carmine Pillar, Flora McIvor, Jeannie Deans, Macrantha, Brenda, Meg Merrilies, Rugosa alba, Janet's Pride, Anne of Geirstein, Lord Penzance, and Anemone; while Messrs. F. Cant and Co. followed with a good exhibit, and Messrs. G. Cooling and Sons, Bath, third.

Messrs. F. Cant and Co. were the only exhibitors for nine bunches of Roses, and were awarded first prize. The varieties were Common China, Fellenberg, Laurette Messimy, Madame E. Resal, Irene Watts, Queen Mab, Antoine Guillerat, Cramoisie Supérieure, and Mrs. Bosanquet.

For a bowl of Roses Miss B. Langton, Raymead, Hendon, secured premier honours with a fine bowl of Carmine Pillar. Mr. O. G. Orpen was second with a beautiful arrangement of pink and yellow Roses.

For a representative group of Roses in a space not exceeding 200 square feet, three competitors came out, Mr. Chas. Turner, Slough, being placed first with a good free arrangement. The large specimen plants of Alberic Barbier and Auguste Barbier were hardly forward enough, otherwise they were effective, the front being composed of large bunches of Hybrid Perpetuals, Teas, singles, and others.

Messrs. Paul and Son, Cheshunt, were a good second, the best features being large flowering growths of Rugosa repens alba, splendid bowls of Lady Battersea, Tea Rambler, and Carmine Pillar. Mr. Geo. Mount, Canterbury, was third, having bunches of Tea Roses for his best feature.

#### Hardy Florists' Flowers.

Mr. Vincent Slade, Staplegrove Nurseries, Taunton, Somerset, made a fine exhibit of single flowered Zonal Pelargoniums staged in large trusses. Seventy-two varieties of single and doubles were here presented. Of the singles the finer were Mark Twain, Lady Mary Beton, Midsummer, Mary Hamilton, Mr. T. E. Green (brilliant orange-scarlet), and Lady Curzon (a soft blush-peach). The doubles were all good.

Sweet Peas were beautifully staged by Jones and Sons, of Shrewsbury, the collection being quite a large one, the flowers loosely arranged in glasses varying in sizes from 5in at the front to 12in at the back; but Spanish Irises were arranged on the raised back line. About twenty trusses with own foliage were in each glass, and the long table had three stages covered with a white cloth. Their Irises were really a beautiful show alone, having a few Grasses (only a few) for effect with the flowers. Mr. Charles Turner, Slough, had a collection of Pinks.

The contribution of tuberous Begonias from the famous Yeovil Nurseries of B. R. Davis and Sons, showed plants of very great vigour, carrying an abundance of extra large flowers, many of

them of excellent form. We may name such singles as Grandis (orange-red), Diadem (really a semi-double, a magnificent and strong flower, with wavy segments and deep crimson colour), and Rugosa (a pretty rose-carmine). The doubles were Professor Lanciani (good form, smooth, large, and of a bright salmon-scarlet), Mrs. Hebelar (medium size, but excellent form, bright rose-pink), Madame Gautier (carmine), Mrs. Portman Dalton (white, suffused rose), and Marchioness of Bath (pure white, and very free flowering).

Blackmore and Langdon, Twerton Hill, Bath, had very fresh flowers, with excellent healthy foliage, dwarf close habit, and grand flowers. Our choice of the doubles fell on M. J. Desloges (a bright salmon-pink), Mrs. Heathcote (yellow, but is faulty at centre), Marchioness of Bath (a pure white), Vulcan (a strong and perfectly formed deep scarlet-crimson), Seagull (the best of the all whites), and lastly, the General (a monster sized orange-crimson).

Messrs. Peed and Son's Gloxinias from their Nurseries at West Norwood, London, were admirable in all respects, and a few named varieties were amongst those staged. Howard Peed, with white edge and crimson-rose within, is a grand flower, while the large-flowered violet-purple Empress of India is another good sort. Duchess of York is violet speckled, C. Young is an intense glowing crimson-scarlet, and Mrs. John Peed has a white throat and lavender-violet edge.

Messrs. Cannell had their Cannas from Swanley. Of these we would name Aurore (a rich orange-red), Oscar Bannaker (a dazzling, golden-red, with rich yellow edge), Elizabeth Hoss (yellow, speckled over with crimson), Black Prince (deep crimson), and Miss Florence Panwels (crimson-scarlet).

Mr. J. Forbes, Hawick, Scotland, made a novel exhibit of Pentstemons, Antirrhinums, and Phloxes in pots. The latter were especially charming, the colours being bright and clear; the best were Lord Rayleigh, Coquelicot, Eden, W. Ramsey, Mount Sully, and Aurora. The Pentstemons were very tall and would have been more effective on the ground, but the strain is undoubtedly one of the very finest at the present day. The best were Wm. Robb, Jules Barbier, Mrs. Irvine, Phryne, and Mrs. Forbes.

Messrs. Dobbie and Co., Rothesay, made a large display of Aquilegias, Pansies, Violas, and cut Regal Pelargoniums. The Pansies were in grand condition; most noteworthy were Nellie Meikle, Mrs. R. Fife, Mr. Chas. Stirling, and R. C. Allen; while the most striking Violas were Meteor, Mrs. J. McCrae, Ophelia, Mary Robertson, General Baden-Powell, and Saturn. The Pelargoniums were exhibited in large loose bunches and were effectively arranged.

Messrs. B. S. Williams and Son, Upper Holloway, made a nice display of Spanish Irises in great variety, Delphiniums, and a few other hardy flowers; mention must be made of some splendid pots of Verbena Miss Willmott.

Messrs. Paul and Son, Cheshunt, presented a fine table of Pæonies, the blooms were large and bright; a few were Duchesse de Nemours, Felix Crousse, La Perle, and Boule de Neige. A collection of variegated foliage trees and shrubs was most interesting, the remainder of the exhibit being composed of hardy flowers which were staged in large effective bunches.

Pæonies were the chief feature from G. Jackman and Son, Woking, though the firm staged a fine collection of hardy flowers, which included some fine Delphiniums, in which were D. nudicaule, Kalmia myrtifolia, and a beautiful form of Cypripedium spectabile, besides a number of rock and alpine plants.

From Messrs. W. Cutbush and Son, Highgate, came a fine collection of Carnations arranged loosely in vases, the background being composed of Palms and Veronica amethystinum. A few of the best Carnations here were Don Juan, Lady Wolverton, Bridesmaid, Lady Grimston (in grand form), Nautilus, G. B. Bryant, Herbert J. Cutbush, Baldwin, and Robin Measures. The same firm also occupied the entire side of one tent with a miscellaneous display. The Lantanas, in 5-inch pots, being well flowered, the bronze, yellow, and white being good. Some fine plants of Boronia elatior, Ericas Bothwelliana and translucens were also shown, while Verbena King of Scarlets was very bright, as was also Miss Willmott. The new Marguerite, Coronation, was much in evidence. Kalosanthes in variety, Oranges, carrying a fine crop, in 5-inch pots, with a few Begonias, completed a grand display.

Mr. A. Perry, Winchmore Hill, made a very large display of hardy flowers, with a fine exhibit of water plants and Nymphaeas; in the former the best were Heuchera sanguinea, Walker's variety. Papaver Novelty, English Irises, Ixias, Tritomas, Gaillardias in variety, Anemones, and Ranunculi were charming. The water garden was most refreshing after the gorgeous display of bloom. The quaint Pontederia crassipes attracted much attention, the whole being naturally arranged, even to fish, salamanders, snails, and so on.

Messrs. Jas. Veitch and Son, Limited, Chelsea, confined their efforts to a nicely arranged table in No. 2 tent. The chief features were Lobelia tenuior, Rehmannia angulata, Corydalis thalictrifolia, some splendid plants of Kalanchoe flammula and K. Kewensis, also a beautiful strain of Streptocarpus.

Messrs. W. Bull and Sons, Chelsea, made an effective display

of English and Spanish Irises, with a few Anemones; the yellow and blue looking well in their green setting.

Messrs. Hobbies, Limited, Dereham, staged a large table of Roses, Carnations, and Violas. The Roses were beautifully arranged, Dorothy Perkins and Crimson Rambler excellent, being perfect masses of bloom. The Malmaison Carnations, arranged in fern, were also attractive. The Sweet Peas were beautifully staged and well grown, the best bunches being Miss Willmott, Lord Rosebery, Dorothy Eckford (grand), Prince of Wales, Countess Cadogan, Aurora, George Gordon, Othello, Gracie Greenwood, and Jeannie Gordon. A fine exhibit of *Lathyrus grandiflorus albus* completed the display.

A refreshing exhibit was that staged by Mr. C. Dixon, gardener to the Earl of Ilchester, Holland House, which was composed of a group of Succulents of various ages raised from seed, and backed with some fine plants of *Asparagus Sprengeri*.

From Mr. G. Reuthe, Keston, Kent, came a nice exhibit of hardy flowers, a few spikes of *Eremuri* attracting much attention; the best were Mrs. Reuthe, a pale sulphur, Aurora, Warei, and Robustus. Iris Susiana, *Cypripedium spectabile*, and a nice collection of *Ixias* were also noted.

Tree Carnations were exhibited by Mr. A. F. Dutton, Bexley Heath. The blooms were displayed in large glasses and were beautifully grown. The varieties were Madame Melba, Royalty, Mrs. T. W. Lawson, and G. H. Crane.

Messrs. Storrie and Storrie, Dundee, exhibited a beautiful strain of *Streptocarpus*, which consisted of a great variety of colours. The Iceland Poppies included many new shades which are sure to become popular. A few single Begonias arranged in Maidenhair Ferns were decidedly good. Mr. J. Robson, Altrincham, sent a fine basket of *Dianthus Napoleon III*. Mr. J. R. Box, Croydon, arranged a natural rockwork in the ground. The chief features were the Sedums and Sempervivums.

A pleasingly arranged collection of hardy flowers, most of them such as are not found every day in gardens, was staged by the Misses Hopkins, of Knutsford, Cheshire. Leopold de Rothschild, Esq., sent his blue Water Lily.

Barr and Sons, of King Street, Covent Garden, were very strong in this, their section. Spanish Irises were admirable, and of these we will name Blue Stone (dark blue), The Moor (dull bronzy purple), Panorama (clear yellow), Princess Ida (tea, with primrose lip), Helene (lavender-violet, with orange blotch on lip), California (golden), Golden King (very rich), Snow Queen (white, with yellow blotch), Vasco de Gama (a beautiful combination of golden-yellow and purple), also Thunderbolt (bronzy-brown and purple-violet). They also had tufted Pansies, named *Ixias*, some beautiful Gladioli, of The Bride type, the best being Ne Plus Ultra (carmine with white dash on lower segments), Pink Perfection, and Peach Blossom. Their *Kämpferi* Irises were a treat in themselves, and with these were Pæonies, Delphiniums, Lilies, &c.

Messrs. Geo. Bunyard and Co., of Maidstone, had a seasonable collection, including *Francoa appendiculata* (mauve-white), and the semi-double white pyramidal *Campanula Moerheimi*.

Mr. M. Pritchard, Christchurch, Hants, was represented by a select collection of the best flowers of this period, but rather tightly staged. Another group, edged with cork bark—a great improvement—came from Mr. W. B. Child, Edelweiss Nurseries, Acock's Green, whose varieties were absolutely the choicest the hardy plant border affords. He had *Campanula persicifolia*, Daisy Hill, a double deep lavender; *Achillea serrulata*, W. B. Child, with dazzling white, loose umbels; *Incarvillea Delavayi*, *Brodiaea laxa*, *Libertia formosa*, and *Meconopsis cambrica plena aurea*, a glowing mass of orange-scarlet. Mr. R. C. Notcutt, Woodbridge Nursery, Woodbridge, contributed, in his group, *Papaver nudicaule alba*, *P. n. aurantiaca* (a beautiful thing), single Pæonia Leander (rose-purple), *Dianthus cruentus*, Delphinium Monarch, and *Geranium ibericum*.

The long-spurred Aquilegias from Messrs. Cannell had suffered from the rain, but they were well staged. Pæonies and Delphiniums were liberally staged from Kelway, of Langport, but their method of staging the lovely Pæonies calls for protest, a protest we have hitherto mildly advanced. The visitors as well as the firm are the losers from poor staging. Amongst the Delphiniums, a new primrose yellow—Beauty of Langport—calls for attention, and we may also name Coronation, Albert Edward, Rev. W. Wilks, Lord Hawke, F. Carr, and Captain Lambton as good sorts.

Messrs. Ware, Limited, were also represented by a formidable array of cut hardy flowers, and here was staged the double Rocket, Poppies galore, *Ornithogalum pyramidalis*, *Gillenia trifoliata*, *Sempervivum triste* bicolor, with columnar spike, *Primula capitata*, *Ostrowskia magnifica alba*, *Romneya Coulteri*, *Hypericum gracile*, and other choice subjects.

#### Stove and Greenhouse Plants.

Messrs. J. Veitch and Sons, Ltd., Chelsea, had a large collection of varied stove and greenhouse plants, including masses of their hybrid Javanese Rhododendrons, Orchids, Malmaison Carnations, Caladiums, *Davallia tenuifolia* Veitchiana, *Nidularium splendens* (a Bromeliad), *Leea amabilis splendens*, *Nepenthes*, Anthuriums, Crotons, Cannas, and *Lilium Henryi*. No

other group was so effectively arranged, and to Mr. Tivey great credit is due in this respect.

The new *Asparagus myriocladus*, together with *Eugenia myriophylla* and Crotons came from the Ranelagh Nurseries Co., of Royal Leamington Spa. Showy Caladiums in distinctive varieties came from Messrs. Laing and Sons, who also had tuberous Begonias, very nicely staged, with Eulalia here and there rising above the flowers; and at the end of the table was a collection of hardy flowers, Irises and *Saxifraga sarmentosa* tricolor superba. Their *Streptocarpus* were also very fine.

Tree Ferns, Cordylines, *Phoenix rupicola*, Hydrangeas, and varied stove subjects came from Bull and Sons, King's Road, Chelsea. The group was good, though rather compact in places. Messrs. Peed and Son again had their very fine collection of Caladiums; John Russell, of Richmond, sent stove and greenhouse foliage plants, and H. B. May, of Edmonton, sent a varied group of the best quality market plant subjects; while from Hill and Son, of Lower Edmonton, there was another of their renowned Fern collections. Crotons from Lord Aldenham's garden made a bright display.

#### Trees and Shrubs.

R. and G. Cuthbert, The Nurseries, Southgate, had Rhododendrons, Hydrangeas, Gladiolus Blushing Bride and Peach Blossom; also Ivy-leaved Pelargoniums and foliage plants.

A magnificent and really wonderful collection of cut sprays of hardy trees and shrubs was presented by Lord Aldenham (gardener, Mr. E. Beckett) from his private garden at Aldenham House, Elstree. One can only name a few, for a table 60ft long and 3½ft broad was entirely filled with them. We may note, then, *Berberis Fortunei*, *B. fuchsoides*, *Pyrus Fifianna*, *Ulmus glabra variegata*, *Acer platanoides Schwedleri* (red), *Syringa Emodi* (silvery beneath), *Lonicera Barberi*, *Rhodotypos kerrioides*, *Fagus sylvatica pyramidalis* tricolor, and the variegated Tulip Tree. The collection was of sufficient interest to publish the full list of the subjects shown, but time did not allow us to note them all.

Messrs. W. Cutbush and Son, Highgate, made a large display of clipped Box and Yew trees, trained in all sorts of fantastic shapes. Mr. J. Russell, Richmond, had a fine display of Ivies, both large and small specimens in capital varieties, the golden and variegated forms being especially bright.

Acers and Conifers were largely represented by Messrs. T. Cripps and Son, Tunbridge Wells. The Acers made a fine show, and the whole exhibit was well arranged.

Messrs. J. Cheal and Son, Lowfield Nursery, occupied a large space in the open air with an exhibit of coloured shrubs and trees, Conifers in variety, with a few flowering shrubs. The exhibit was pleasingly arranged.

From Messrs. J. Waterer and Sons, Bagshot, came a fine collection of Conifers and shrubs grown in pots, also a few Rhododendrons. The chief feature, however, were the Kalmias, which were in excellent condition, full of flower.

Messrs. W. Fromow and Sons, Chiswick, had a large semi-circular group of Conifers, shrubs, Acers, and similar plants, the whole being well grown and in excellent condition.

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, were represented in the open air by some fine specimen Conifers and a collection of Delphiniums, grown in pots, in first-rate variety. They were greatly admired.

#### Horticultural Sundries.

The Council of the Society having allowed the sundriesmen a special tent, a large number of varied exhibits were staged, and this section is of sufficient interest to be repeated and added to.

Messrs. Wm. Wood and Son, Ltd., Wood Green, London, set up a display of garden statuary and architectural figures, such as a deerhound, lion, stork, eagle, boy, urns, vases, dials, fountains. They had also their well-known hanging flower baskets, named The King (as supplied for the King's yacht last summer), The Queen, with one suspending rod instead of three, and The Empire basket. There was a large number of samples of chemical manures, and meteorological instruments, liquid insecticides and sprayers, hose-piping, cutlery, stakes, loam, &c., and, indeed, quite a great array of most useful articles and subjects.

The Standard Manufacturing Co., Ye Olde Moat Hall, Derby, had a very embracing show of tree and shrub pruners, parasol holders, and the "Aërotor" scarifier.

From the Hull Chemical Works, Ltd., came a selection of their Bitter-oil insecticide, the fungicide and mildew destroyer, and Tala sprayer, which we noticed last week.

W. Herbert and Co., Hop Exchange, S.E., showed quite a large number of new improvements in garden appliances and sundries. The new wall clip, the sprayers and syringes, Jadoo fibre. Abol insecticide, fertilisers, &c., were on view.

Messrs. Pulham and Son, 71, Newman Street, Oxford Street, London, W., had ornamental vases, dials, and urns—a goodly selection. Mr. John Pinches, 3, Crown Buildings, Crown Street, Camberwell, S.E., had a large choice of labels, sieves, wire fences, and arches. The "Acme" bloom protector was also shown.

Ohlendorff's Horticultural Manures were displayed by the Anglo-Continental Guano Works, of 30, Mark Lane, London;

*Veronica spicata.* (See page 8.)

while Osman and Co., 132 and 134, Commercial Street, London, S.E., had vases, glasses, ornamental little bowls and dishes, hellebore powder, artificial flowers and dyed Pampas grass, with also a large assortment of small garden tools and sundries.

Messrs. Valls and Co., 16, Coleman Street, London, sent samples of their "Beetlecute" for exterminating beetles, cockroaches, ants, woodlice, &c. Mr. R. Sydenham, Tenby Street, Birmingham, and J. Williams, 4A, Oxford Road, Ealing, had the Rural Table Decorations, and very graceful they are.

Messrs. Champion and Co., 115, City Road, E.C., had a varied selection of well finished tubs made of oak and teak wood, smoothed and varnished outside. They are in different sizes and shapes, with bronze handles and copper rims. These tubs are highly spoken of by everyone. The Boundary Chemical Company, Liverpool, sent their Climax weed-killer, their Premier lawn and other manures, Vine dressing, quassia soap, and slug destroyer. Messrs. S. and E. Collier, Ltd., Grovelands, Reading, had pottery ware—plant pots, columns, vases, edging tiles, saucers, and, what is uncommon, clay-made baskets the same as the wooden ones, for Orchid culture. Mr. J. George, 14, Redgrave Road, Putney, S.W., contributed Orchid peat, Mushroom spawn, Lawton's patent clip for suspending pots, Nicotiana fumigator, and Thomson's Vine, plant, and vegetable manure.

The "Pattisson" lawn boots were staged by Mr. H. Pattisson, 1, Farm Avenue, Streatham, S.W. Messrs. James Green and Nephew, 107, Queen Victoria Street, E.C., staged some lovely glass vases of superior quality, in a great variety of shapes, and all of the highest excellence for decorative purposes. Messrs. D. Dowel and Son, Ravenscourt Avenue, Hammersmith, whose speciality is Orchid pots and pans, had a very wide selection of them, from the tiny thimble pots for seedlings to the largest pans. Messrs. Lee and Co., Bank Street, Maidstone, sent their fruit bottling apparatus, of which they have a full descriptive pamphlet obtainable on application. Mr. W. Bowen, Halstead, Sevenoaks, had a selection of tree poles, Chrysanthemum sticks, and other stakes, as well as charcoal and wood for rustic work. Messrs. Wm. Poore and Co., American Stove Stores, 139, Cheap-side, E.C., staged their Challenge hot-water apparatus for stove and greenhouse. These are strongly made and well finished, and very serviceable, so far as our inspection could prove, for amateurs' small houses. They had a goodly selection of patterns. Eggett and Son, artistic rock workers, Thames Ditton, sent photographs of their work. The Economic Fencing Co., Ltd., Billiter House, Billiter Street, London, sent a specimen of their fencing, made of rough trimmed chestnut spars, wound together with stout wire.

#### Certificates and Awards of Merit.

*Begonia, The Queen* (J. Laing and Son).—A lovely fringed single of good shape and habit, and prettily coloured a warm blush creamy pink. A.M.

*Begonia, W. Sparkshott* (B. R. Davis).—Flowers 6in across, perfectly double, with grand, solid petals, very smooth, and of an intense scarlet with a dash of orange. A.M.

*Begonia, Gipsy Girl* (B. R. Davis and Son).—A single crested variety, coloured a sweet rose-pink. A.M.

*Begonia, Countess of Warwick* (Blackmore and Langdon, Bath).—A double, and one of the richest coloured flowers up to date. The form is perfect, with a rich yellow or canary centre and orange-red edge; the variety is exquisite. A.M.

*Carnation, Shiela* (W. Cutbush and Son).—A border, yellow ground Fancy, flaked and bordered crimson, and of good size. A.M.

*Carnation, Lady Wolverton* (W. Cutbush and Son, Highgate, N.).—A good border variety of a rich rose-salmon; the flowers large and fragrant. A.M.

*Cattleya Mossiae, var. Alexandra*.—Large, massive flowers, with recurving segments, which are broad, smooth, and white. The throat is yolk-hued yellow and pale mauve in front, the edge being white. F.C.C.

*Cattleya* × *Rohersiana*.—Parentage: Mendeli × Hardyana. Flowers white, with purple tinged sepals and petals, the front of the lip glowing crimson-purple. F.C.C.

*Cattleya Warneri alba* (Mons. A. A. Peeters, Brussels).—Besides receiving a F.C.C., a cultural commendation was awarded for a magnificently flowered piece of this beautiful Orchid. One lead

had fine splendid flowers, pure white except for the creamy throat to the lip. F.C.C.

*Delphinium, Monarch* (R. C. Notcutt, Woodbridge).—This variety has immense long spikes, dense and round. The large single flowers are nearly 2ins across, and dark purple blue. A.M.

*Delphinium, Rev. W. Wilks* (Kelway and Son, Langport).—A strong flowered, semi-double spike, dense and good, and flowers intense violet purple. A.M.

*Eremurus* × *Mrs. Reuthe* (G. Reuthe, Keston, Kent).—A hybrid between *E. Turkestanicus* × *E. Warei*. The spikes are 2ft long, 3ins in diameter, with flowers like those of a Kalmia, at least for size and shape, and of a primrose colour. A.M.

*Lalio-Cattleya* × *Martinetti* var. *Flambeau*.—Parentage: C. Mossiae × L. tenebrosa. A showy flower, with fringed lip, coloured bright mauve purple, and the petals and sepals are bronzy-red. F.C.C.

*Lalio-Cattleya* × *Martinetti* var. *ochracea*.—Sepals and petals yellow, lip rose, veined purple. A.M.

*Lilium Kelloggii* (Barr & Sons, Covent Garden).—Presumably a Japanese Lily with medium or small rose-purplish flowers, spotted with deep purple, and having the segments completely reflexed. A.M.

*Lilium auratum platyphyllum Shirley variety*.—Immense flowers, with sepals that are narrower than the type, and finely crinkled; otherwise the flowers are typical. F.C.C.

*Nicotiana Sandera*.—A cross between *N. rubra* and *N. affinis*. The long branching stems bear slender tubed flowers along their length, and are coloured rose purplish. A.M.

*Odontoglossum Rolfei* var. *majesticum*.—Flowers are of large size and well opened, the ground colour is pale tea shade, speckled and spotted with magenta-purple. The raceme bore twelve flowers. F.C.C.

*Odontoglossum ardentissimum* var. *Fascinator*.—This has a large, central, shield-shaped magenta blotch on each segment, the ground being white. A.M.

*Paeonia, "Dawn"*.—A beautiful rosy-pink, semi-double. A.M.

*Papaver orientale Lady Roscoe* (R. C. Notcutt, Woodbridge).—A bright salmon-scarlet with black blotches at base of petals. A.M.

*Poppies* (Storrie and Storrie, Dundee).—This firm showed a beautiful strain of Iceland Poppies in uncommon colours, such as pink, orange-pink, greenish-white, tea, salmon, rose with orange reverse, milk white, and received an Award of Merit for the strain.

A Cultural Commendation was awarded to Sir William Marriott, Bart., for Disa × Clio; and to Mr. Peters for Cattleya Warneri alba.

#### Medal Awards.

GOLD MEDALS to Lord Aldenham (gardener, Mr. Beckett), Elstree, for Crotons and cut shrubs; Jas. Veitch and Sons, Limited, for choice stove and greenhouse plants, Conifers, &c.; John Russell, for stove and greenhouse plants and Ivies; T. Rivers and Son, Sawbridgeworth, for fruit trees in pots; Wm. Cutbush and Sons, for Carnations, flowering plants, and clipped

trees; Wm. Bull and Sons, Chelsea, for cut flowers and foliage plants.

SILVER CUPS to J. Colman, Esq., Reigate, for Orchids; L. de Rothschild, Esq., Gunnersbury House Gardens, Acton, for fruit; Blackmore and Langdon, Twerton Hill Nursery, Bath, for Begonias; Hobbies, Limited, Dereham, for Roses, Carnations, Violas, and Sweet Peas; H. B. May, Upper Edmonton, for Ferns and foliage plants; T. S. Ware, Limited, Feltham, for herbaceous and alpine plants; J. Peed and Son, W. Norwood, for Sweet Peas, Gloxinias, and Caladiums; H. Cannell and Sons, Swanley, for Cannas, Aquilegias; J. Carter and Co., High Holborn, for Gloxinias, pigmy trees, &c.; A. Perry, Winchmore Hill, for hardy cut flowers and aquatics; H. Low and Co., Enfield, for Orchids; Dobbie and Co., Rothesay, for Violas, Pansies, Pelargoniums; J. Hill and Son, Lower Edmonton, for Ferns; Charlesworth and Co., Heaton, Bradford, for Orchids; T. Cripps and Son, Tunbridge Wells, for hardy trees and shrubs.

SILVER-GILT FLORA MEDALS to Mr. Geo. Mount for Roses; Messrs. Barr and Sons for hardy flowers, &c.; Cheal and Sons, Crawley, for hardy shrubs and trees; B. R. Davis and Sons, Yeovil, for Begonias; Jones and Sons, Shrewsbury, for Sweet Peas, Irises, &c.; Paul and Son, Cheshunt, for Roses; J. Laing and Sons, Forest Hill, for Begonias, Caladiums, Streptocarpus; J. Waterer and Sons, Bagshot, for Kalmias and Rhododendrons; Mr. Forbes, Hawick, for Phloxes, Pentstemons; Messrs. G. Jackman and Sons, Woking, for hardy flowers.

SILVER-GILT BANKSIAN MEDALS to Messrs. Kelway and Son for Delphiniums, Paeonies, &c.; Mr. W. B. Child, Birmingham, for hardy flowers; Mr. Prichard, Christchurch, for hardy flowers; Messrs. Cuthbert and Sons, Southgate, for flowering plants; Mr. Anker, Kensington, for Cactaceous plants; Messrs. Fromow, Chiswick, for Japanese Maples and shrubs; Mr. Notcutt, Woodbridge, for hardy flowers.

SILVER FLORA MEDALS to Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; Lord Ilchester, Kensington, for succulents; Mr. Iceton, Putney, for Lily of Valley, &c.; The Ranelagh Nursery Company, Leamington Spa, for foliage plants; Mr. Reuthe, Keston, for hardy flowers; Messrs. Storrie and Storrie, Dundee, for Iceland Poppies; Mr. G. Prince, Longworth, Berks, for Roses.

SILVER BANKSIAN MEDALS to Mr. J. R. Box, West Wickham, for alpine and rock plants; Mr. A. Dutton, Bexley Heath, for Carnations; Mr. V. S. Slade, Taunton, for cut Pelargoniums; the Misses Hopkins, Mere, Knutsford, for hardy flowers; Mr. R. Sydenham, Birmingham, for Sweet Peas; Messrs. B. S. Williams, Upper Holloway, for Orchids and hardy cut flowers; Baron Rothschild, Vienna, for Pineapples; Mr. Turner, Slough, for Pinks.

SUNDRIES AND IMPLEMENTS.—SILVER FLORA MEDALS to Messrs. Pulham for stone vases, &c.; Messrs. Green for glass vases; Messrs. Champion for tubs for trees, &c. SILVER KNIGHTIAN MEDALS to Messrs. Wood for sundries; Messrs. Osman for sundries. SILVER BANKSIAN MEDALS to Mr. Riley for summer houses, &c.; Mr. George for sundries; Messrs. Dowel for pottery, &c.; Messrs. Herbert for sundries; Mr. Pinches for labels; The Standard Company for pruners, &c.; Messrs. Ohlendorf for manures.

### National Rose, Temple Gardens.

After a season such as the one lately passed, it is gratifying to be able even to say that the Temple Rose Show was below par, because the comparison first of all infers that there *was* a show, which, till within a few days ago, one hardly dared to expect; and secondly that it was a show at all events nearly approaching the higher standards of better years. The tents were sparsely filled on the whole, and many corners had been given over to hardy plants, Orchids, and Cannas. The Garden varieties of the Rose stood in good stead to the promoters, and the table decorations were exceedingly beautiful. Here and there throughout the show some even stands were seen, but on the whole the blooms are undersized, lacking in form, smoothness, and good rich colours. The arrangement of the tables, in continuous lines, seems unfortunate, as crossing to opposite sides can only be done by a long march round either end. The day was bright, warm, and enjoyable. No new varieties, nor any pot Roses were staged, but a new feature was the decorated arches, Class 21.

#### NURSERYMEN'S GENERAL SECTION.

DIVISION A., CHAMPION TROPHY CLASS (seventy-two distinct varieties).—The first prize in class 1 is a trophy, a gold medal, and £4; the second, £4; and the third, £2. Seven exhibitors were forward, and furnished a very creditable display.

The leading honours fell this time to Messrs. Harkness and Co., Hitchin, Herts, whose finest blooms we indicate by asterisks (\*). The complete set were as follows: Caroline Testout, Etienne Levet, White Lady, Helen Keller, Bessie Brown\*, Dupuy Jamain, Cleopatra, Duke of Teck, Mrs. R. Garrett, La France de '98, Maman Cochet, Rev. A. Cheales\*, Boadicea, Dr. Sewell\*, Mons. Noman, Gustave Piganeau\*, Duchesse de Vallambrosa, A. K. Williams, Lady M. Fitzwilliam, F. Michelson, Frau K. Druschki, Marquis Litta\*, Marchioness of Downshire\*, and Ulrich Brunner; second row: Golden Gate,

Souv. de Pierre Notting, Laurence Allen, Comte de Raimbaud, Marchioness of Londonderry, Duke of Edinburgh, Mme. Jules Grolez, S. M. Rodocanachi, Mrs. W. J. Grant, Horace Vernet, Mme. G. Luizet, Général Jacqueminot, Jean Ducher, E.Y. Teas, Mrs. J. Laing, Mildred Grant, Duke of Connaught, White Maman Cochet, Mrs. Ed. Mawley, Mons. Delville\*, Souv. de Pres. Carnot, Prince Arthur\*, Souv. de S. A. Prince, and Grand Mogul; front row: Souv. d'un Ami, Xavier Olibo, Souv. d'Elise Vardon, Duke of Wellington, La France, Queen of Queens, Earl of Dufferin, Mme. Hoste, Pride of Waltham, Viscountess Folkestone, Comtesse de Ludre, Mme. Cusin, Hon. E. Gifford, K. A. Victoria\*, Countess of Rosebery, Margaret Dickson, Marie Baumann, Luciole, Exposition de Brie, Clara Wilson, Mme. Hauseman\*, Countess of Caledon, and Ulster. The collection was, indeed, creditable, and much admired.

The second place was accorded to B. R. Cant and Sons, The Old Rose Gardens, Colchester, and the blooms seemed a little heavier than those of the succeeding prizewinners, F. Cant and Co., of Braiswick, Colchester. In B. R. Cant's stand we found one of the best Bessie Brown blooms of the exhibition. K. A. Victoria was also well shaped and firm; Countess of Rosebery (small, but good), Marie Corelli (fair), Her Majesty (fair), Mme. G. Luizet (good, and very sweet to look upon), Mildred Grant (large, but loose and not attractive in colour), Gustave Piganeau (one of the finest on the stand), and lastly La Havre (a fine flower). Messrs. F. Cant had as their best the following: Ulster (nicely coloured), Prince Arthur (intense hue, though a loose flower), Souv. de P. Notting (neat and small), Lady Mary Corry (of the same shade, but with rounded petals), Marie Baumann (large, full, good), and lastly Caroline Testout.

The second class on the schedule, for forty varieties in trebles, drew four competitors, but the blooms were terribly weak. Messrs. B. R. Cant and Sons led off, and had the following flowers: Bessie Brown (good), A. K. Williams, Killarney, Helen Keller, Exquisite, Souv. d'un Ami, Duke of Teck, and K. A. Victoria (good) in the first box; Mrs. Cocker, Comte de Raimbaud, Souv. de S. A. Prince, Mrs. W. J. Grant, Marie Baumann, Frau Karl Druschki (good), Mildred Grant, Countess of Caledon (fair), in the second box; Mme. Hoste, Mrs. B. R. Cant, Antoine Rivoire, Dr. Sewell (very poor), Rubens, Empress Alexandra, Mrs. S. Crawford, and Ulrich Brunner, in box three. Then came Mme. G. Luizet (fair), Crown Prince, Medea, Mrs. Ed. Mawley, Mme. C. Ramey, Tom Wood, Dupuy Jamain, and La France in the fourth box; and the last of B. R. Cant's in this class were Mme. J. Grolez (poor), Marchioness of Downshire, Clio, Prince Arthur (small and rich), Suzanne M. Rodocanachi, White Lady, Hélène Guillot, and lastly Caroline Testout. Messrs. A. Dickson and Sons, Ltd., Newtownards, Co. Down, as seconds had small flowers, the pick being Ulster, Souv. d'un Ami, Shandon, Mrs. Geo. Kirk (a new coppery-tea), Marquis Litta, Gustave Piganeau (very fine), Lady M. Fitzwilliam, and Bessie Brown. Third came F. Cant and Co. with fair samples of La France, Lady Clanmorris, Tennyson, Mrs. J. Laing, and Frau Karl Druschki.

DIVISION B, CLASS 3, FORTY-EIGHT BLOOMS, DISTINCT.—Out of the entries in this class, the leading place was taken by Messrs. G. and W. H. Burch, Peterborough, with a fair, even set, including Caroline Testout, Marquis Litta, La France, Tom Wood, Viscountess Folkestone, Marchioness of Downshire, Margaret Dickson, François Michelson, Mrs. J. Laing, Countess of Oxford, Charlotte Guillemot, Gustave Piganeau, Clio, Mrs. W. J. Grant, Danmark, Her Majesty, in the back line; Bladud, Marie Baumann, Medea, Duchess of Bedford, White Lady, Ulster, Mme. C. Ramey, Frau C. Druschki, Luciole, Duke of Edinburgh, Mrs. Ed. Mawley, Horace Vernet, Bessie Brown, Rev. Alan Cheales, Lady Fitzwilliam, Ulrich Brunner, in the second row; and in the front row were Antoine Rivoire, A. Guinoisseau, X. Olibo, Lady Clanmorris, Mme. Hoste, Countess of Caledon, Anna Olivier, Comte Raimbaud, Mrs. S. Crawford, Dr. Sewell, Rubens, Exposition de Brie, Souv. de Président Carnot, Mme. G. Luizet, Maman Cochet, and Mme. E. Verdier. Messrs. Hugh Dickson and Co., Belfast, followed second, and had a model Etienne Levet and La France. Messrs. Burrell and Co., of Cambridge, followed third, out of four.

For the two dozen blooms in Class 4, Mr. Geo. Mount, of Canterbury, came foremost with fairly good flowers. He staged Caroline Testout, Ulrich Brunner, Mildred Grant, Xavier Olibo, Frau Carl Druschki, Mrs. J. Laing, Marquis Litta, and a good Bessie Brown; in the second row came Lady M. Fitzwilliam, Mme. C. Ramey, Prince Arthur, Killarney, Gén. Jacqueminot, La France, Lady Mary Beauclerc, and Duke of Edinburgh; in the front row there were Mrs. W. J. Grant, Souv. de Président Carnot, Mrs. S. Crawford, Viscountess Folkestone, Margaret Dickson, K. A. Victoria, Mme. Luizet, and Mrs. Mawley. Mr. Charles Turner must have been a very close second, and staged a perfect bloom of Ulster; while the third place fell to Mr. Thos. Rigg, South View Nurseries, Caversham, Reading, whose flowers were, however, behind in all respects. Six entrants were here.

Three competitors arranged collections in Class 5, for twenty-four varieties in threes, and the lead was given to Charles Turner, but the blooms, as in all the show, were disappointing. He included Bessie Brown, Killarney, U. Brunner, Rubens, Mrs.

Ed. Mawley, Beauty of Waltham, K. A. Victoria, and Maman Cochet in box one; La France, François Michelin, Duke of Edinburgh, Souv. de S. A. Prince, Marquis Litta, C. Testout, Tom Wood, and Margaret Dickson in the second box; in the remaining one there were Ulster, Medea, Gustave Piganeau, Mrs. J. Laing, Gén. Jacqueminot, The Bride, Mrs. S. Crawford, and Dupuy Jamain. Mr. Geo. Mount made a close second, and had good La France, Lady Mary Fitzwilliam, Ulrich Brunner, and Margaret Dickson.

#### Tea and Noisette Section.

**DIVISION I., CLASS 6.**—One can hardly admire the flowers this year, for even the best of them were so much below the show standard. Mr. Geo. Prince, of Longworth, Berks, was placed foremost for twenty-four varieties, his collection embracing Mrs. Mawley (silver medal bloom), White Maman Cochet, Souv. d'un Ami, Medea, Muriel Graham, Cleopatra, Maman Cochet, Devonensis, Emperor of Russia, Princess Beatrice, Mme. de Watteville, Princess of Wales, Lady Roberts, Mme. Hoste, Souv. de S. A. Prince, The Bride, Countess de Panisse, Golden Gate, Cornelia Koch, Comtesse de Nadaillac, Alba Rosea, Bridesmaid, and Souv. de Pierre Notting. Messrs. Prior and Son, Colchester, as seconds, had good average flowers of Mrs. Mawley, The Bride, and Cleopatra; while F. Cant and Co., were thirds also with a handsome Mrs. Mawley.

For the twelve in this section two poor sets were staged, Burrell and Co., of Cambridge, beating Mr. John Mattock from New Headington, Oxford. Burrell's lot comprised Mrs. Ed. Mawley, Souv. d'Elise Vardon, Souv. de Pierre Notting, Boadicea, Mildred Grant, Catherine Mermet, Souv. de S. A. Prince, Souv. d'un Ami, Empress Alex. of Russia, Comtesse de Nadaillac, Lady Roberts, and The Bride.

Class 8 required fourteen distinct varieties, shown as trebles in vases, and only two entries were able to be made. These were from Prior and Son, who led; and Geo. Prince, a close second. Prior's blooms were Souv. d'un Ami, Medea, Mrs. Ed. Mawley, Anna Olivier, Maman Cochet, Caroline Kuster, The Bride, Cleopatra, Souv. de S. A. Prince, Catherine Mermet, Innocente Pirola, Marie Van Houtte, Rubens, and Alba Rosea. Mr. Prince's Mrs. E. Mawley carried him a long way up; they were good. We must apologise for giving such full lists of varieties, but it is necessary for the sake of the yearly Rose analysis, and may be accepted as truly in the interests of Rose culture.

#### Exhibition Roses in Vases.

Five sets of twelve varieties in vases containing seven blooms apiece, were staged as the 9th class, and again Mr. Mount showed the way. There was a freshness and elegance about these exhibits that was decidedly pleasing. Mr. Prince, who arranged his flowers over black velvet, followed for second, and Harkness and Co., of Hitchin, were third.

Mr. Geo. Prince was the only exhibitor of nine distinct varieties in class 10, and though the flowers were small they were nicely set out.

#### Garden or Decorative Roses.

The leading class for garden or decorative Roses was No. 11, which required thirty-six distinct varieties, not less than three trusses of each, and here the richest and brightest contribution came from Paul and Son, of Cheshunt. The flowers were pure in colour, nicely opened, and finely staged; H.T. Dawn, a crimpled-edged rosy pink single, was exquisite; the Moss named Prolific is large, strong, and graceful; Marquis de Salisbury, Mme. J. Dupuy, Mme. Pernet, L'Idéal, Rambler Purple East, and Liberty were each in the pink of condition. Their Rambler Leuchstern, Thalia, and Gustave Regis (H.T.) also showed up to perfection. The second prize fell to Messrs. F. Cant and Co., Braiswick, Colchester, with handsome, well set-up bunches of Souv. de C. Guillot, Souv. de J. B. Guillot, Rainbow, Meta, Hebe's Lip, Mme. Pernet Ducher, Lady Battersea, Papa Gontier, Gustave Regis, Irish Glory, Killarney, Fabvier, Lucida plena, and W. A. Richardson. Then, in the third place, came Cooling and Sons, of Bath, with the rich Soleil d'Or, Moschata alba, Mme. d'Arblay, Hélène, Wallflower, Brunoni fl.-pl., and Mme. F. Weiss. There were but three entries.

Three tables containing each eighteen varieties were presented in class 12, and the awards fell to Mr. Geo. Prince, Mr. C. Turner, and Messrs. Cooling in this order. The flowers speedily withered, but Mr. Prince's Bellefleur, a good bright crimson, stood well, as also Janet's Pride, Madame A. Carrière, Mme. Chedane, Papillon, Moschata alba, Claire Jacquier, Tuscan (dark maroon), and the intense salmon-crimson Marquis of Salisbury. Messrs. Cooling had a massive bunch of Mme. d'Arblay (a profuse white).

For eighteen bunches of summer-flowering Roses (H.P.'s, H.T.'s, T.'s, and Chinas excluded) those staged by F. Cant and Co., were superior to Messrs. Paul and Son's collection, these being the only two entrants. The latter included Anne of Gierstein, Janet's Pride, Mikado, and the old Red Damask; while F. Cant had Red Provence, The Lion, Persian Yellow, Rosa Mundi, Rubin, Lucida plena, myranthes, Maiden's Blush, Leuchstern, The Garland, Hebe's Lip, Red Damask, Claire Jacquier,

Tuscany, Dundee Rambler, The Wallflower, and Inermis—a really choice set.

#### OPEN CLASSES.

##### Nurserymen and Amateurs' General Section.

The fifteenth class asked for twelve Hybrid Teas, and eight sets were presented, the first coming from Messrs. Prior and Son, with fresh blooms as fine as any in the show. Alex. Dickson and Sons, Ltd., were second, and F. Cant and Co. third. For twelve of any white or yellow Rose, shown in a vase, Alex. Dickson and Sons, Ltd., were first with Bessie Brown (which is bluish, is it not?); Medea, from Mr. John Mattock, came second; and Rubens, from Prior, was third. Eight entrants contributed a vase each of any Rose other than a white or yellow, and here again the Newtownards firm led off, having Mrs. W. J. Grant (very choice flowers); Charles Turner being second with Mrs. J. Laing, and the third prize fell to Geo. Mount, with Caroline Testout (flowers large, but loose). In class 18, for nine blooms of any new Rose, the Dicksons of Newtownards were also first, staging Mildred Grant, which, however, were poorly finished. Bunyard and Co. formed a second with Robert Scott, the new American variety of a warm rose-pink hue; and third, B. R. Cant and Sons, with good blooms of Frau Karl Druschki, the pure white H.P.

For twelve distinct varieties of new Roses since spring of 1900, the premier honour fell to B. R. Cant and Sons with Frau Karl Druschki, Alice Lindsell, Perle von Godesberg, William Askew, Souv. de Pierre Notting, Muriel Graham, Helen Guillot, Frau Peter Lambert, Duchess of Portland, Robt. Scott, Fröd. Harms, and Marie Louise Poirer. F. Cant and Co. were next with Mildred Grant, Souv. de Pierre Notting, Lady Mary Corry, Marie Louise Poirer, Mme. Chas. Monnier, Edith D'Ombrain, and Mme. Vermorel; and equal thirds were awarded to Alex. Dickson and Sons, Ltd., and Paul and Son, Cheshunt. The Mildred Grant here was a lovely flower. They also staged a spray of their Tea Rambler, which looked somewhat odd amongst the single blooms. Only four entered in this class.

The next class (No. 21) was a new one in the schedule, and was for an arch decorated with long sprays of two varieties of climbing Roses, and four competed. The shoots, measuring 6ft to 8ft long—flower laden, had been cut, and were trained to the trellis, the cut ends being placed in water. Messrs. Paul and Son led with Tea Rambler and Hélène; Geo. Prince coming second; and third, Mr. J. Mattock.

The sets of three sprays of Roses for ladies' wear was limited to five contestants, and J. Mattock won, Geo. Mount being second, and Messrs. J. B. Langton third.

Only two growers had tables of twelve single flowered Roses, the first award being secured by Cooling and Son with Crimson Bedder, Leuchstern, Yellow Austrian Briar, Paul's Single White, Irish Glory, Moschata alba, Rugosa, Andersoni, The Lion, Pink Roamer, and Lucida. Paul and Son succeeded, and had fine bunches of Rugosa alba, Royal Scarlet, Seneca Anemone, Brenda, &c.

In the last of the open classes, Mr. Geo. Mount beat Mr. Mattock for the nine varieties of buttonhole Roses, shown in vases, in bunches.

#### Best Blooms.

Silver medals were accorded for each of the following: Mr. Geo. Prince with Mrs. E. Mawley, for the best Tea or Noisette; D. Prior and Son with Mrs. John Laing, the best flower other than H.T., T., or N.; D. Prior and Son with Bessie Brown, the best H.T. These were in the nurserymen's section. Amateurs: Mr. E. B. Lindsell with Mrs. J. Laing (H.P.); Mr. Alfred Tato with Bessie Brown (H.T.), and the same competitor with Muriel Graham, the best Tea.

#### AMATEURS.

**GENERAL SECTION.**—The champion class for thirty-six blooms, distinct varieties, was represented by five competitors, who were pretty evenly matched; but eventually Mr. E. B. Lindsell, Hitchen, was awarded the blue ribbon. His varieties were, reading from left to right, White Lady (grand), Prince Arthur, Marchioness of Londonderry, Helen Kellar, Lady Mary Fitzwilliam, Gustave Piganeau, Mrs. J. Laing, Suzanne Marie Rhodocanachi (exploded), Mrs. S. Crawford, Dupuy Jamain, Mildred Grant, and François Michelin; second row: Alfred Colomb, Madame Hoste, Horace Vernet, Muriel Graham, Duchess of Bedford, Mrs. W. J. Grant, Louis Van Houtte, Kaiserin Augusta Victoria, A. K. Williams, Innocente Pirola, Dr. Sewell, and Bessie Brown; front row: Ulster, Beauty of Waltham, Caroline Testout, Victor Hugo, Marquise Litta, Marie Baumann, La France Duke of Wellington, Alice Lindsell, Maurice Baumann, Madame Gabriel Luizet, and Duchess of Portland. Mr. O. G. Orpen, West Bergholt, Colchester, was a good second, relying chiefly on Teas and Hybrid Teas. His best varieties were Mildred Grant (fine), Countess of Caledon, Bessie Brown, White Lady, Madame Jules Grolez, Cleopatra, White Maman Cochet, Medea (beautiful), and Mrs. F. Cant. Mr. Conway Jones, Huaclecote, Glos., was third with good blooms of Niphotos, Mrs. E. Mawley, Caroline Testout, and Bessie Brown.

In the class for twenty-four varieties, distinct, there were five entries, but the steward had so muddled up the classes that it was difficult to find out who had been awarded the prizes; but ultimately it was found that Mr. W. Mease, gardener to A. Tate, Esq., Leatherhead, had been awarded first prize. The varieties were Mrs. E. Mawley (grand), Princess Beatrice, Madame Cusin, Comtesse de Nadaillac, Mrs. W. J. Grant, Gustave Piganeau, La France, Bessie Brown, A. K. Williams, Madame de Watteville, Ethel Brownlow, Horace Vernet, White Maman Cochet, Marchioness of Dufferin, White Lady, Mrs. J. Laing, Medea, Bridesmaid, Marquis Litta, Cleopatra, Corinna, Duke of Teck, Kaiserin Augusta Victoria, and Duchess of Bedford. Mr. Thos. B. Gabriel, Woking, was a good second, his best blooms being Mrs. J. Laing, Caroline Testout, La France, Marquise Litta, Maman Cochet, and its white form; while Mr. E. M. Eversfield, Horsham, was coupled with Mr. Alexander Hill Gray, Bath, for third place.

For twenty-four blooms distinct there were four competitors, Mr. E. B. Lindsell winning first prize. His varieties were Mrs. J. Laing, Chas. Lefevre, Helen Kellar, A. K. Williams, White Lady, Comte Raimbaud, Mrs. W. J. Grant, Gustave Piganeau, Victor Hugo, Kaiserin Augusta Victoria, Prince Arthur, La France, Dr. Sewell, Anna Olivier, Marie Baumann, Lady Mary Fitzwilliam, Madame Gabriel Luizet, Alfred Colomb, Viscountess Folkestone, Beauty of Waltham, Madame Hoste, Duchess of Bedford, Marchioness of Dufferin, and Earl Dufferin. Mr. O. G. Orpen was second with smaller though younger flowers. The best were White Maman Cochet, Bessie Brown, White Lady, Kaiserin Augusta Victoria, and Rubens. Mr. C. J. Salter was third with blooms in rather too advanced a stage.

Class 28 was for twelve distinct varieties, three blooms of each. Here there were four entries, Mr. E. B. Lindsell winning with a nice level exhibit. The varieties were Gustave Piganeau, Mrs. Sharman Crawford, Beauty of Waltham, Mrs. W. J. Grant, Lady Mary Fitzwilliam, Mrs. J. Laing, Kaiserin Augusta Victoria, Marquise Litta, Anna Olivier, A. K. Williams, Madame G. Luizet, and Dr. Sewell. Mr. C. J. Salter, gardener to Mrs. C. B. Haywood, Reigate, was second with good examples of Caroline Testout, Bessie Brown, Madame Gabriel Luizet, and Kaiserin Augusta Victoria; while Mr. Conway Jones was third.

For a single vase to contain nine Roses, except Teas or Noisettes, there were only two entries, the Rev. J. Pemberton, Havering-atte-Bower, being placed first with Caroline Testout, and Mr. C. J. Salter second with Mrs. J. Laing.

#### Divisions D to G.

For twenty-four blooms, distinct, confined to growers of less than 2,000 plants, there were no less than seven entries, the first prize being well won by Mr. R. E. West, Reigate, whose blooms were pretty even throughout. The varieties were Bessie Brown, Suzanne Marie Rhodocanachi, Dupuy Jamain, Caroline Testout, Madame J. Pereire, Madame Hoste, Ulrich Brunner, La France, La France No. 2, Chas. Lefebvre, Mrs. J. Laing, Marquise Litta, Mrs. Paul, Etienne Levet, Madame Gabriel Luizet, François Michelin, Mrs. G. Dickson, Duchesse Val-dromme, Medea, Merveille de Lyon, Dr. Andry, Princess of Wales, Gustave Piganeau, and Souvenir d'un Ami. Mr. W. C. Romaine, The Priory, Old Windsor, was second with nice blooms of Jeannie Dickson, Bessie Brown, Niphotos, La France, and Mrs. J. Laing; while Mr. E. M. Eversfield brought up the rear.

For eight trebles Mr. E. M. Eversfield was well ahead with typical blooms of Comte de Raimbaud, Bessie Brown, Madame Gabriel Luizet, Captain Hayward, Helen Keller, Bessie Brown, Ulrich Brunner, Mrs. J. Laing, and Kaiserin Augusta Victoria. Mr. W. C. Romaine followed with Medea, Maréchal Niel, and Marquise Litta as his best examples, the third prize going to Mr. C. W. E. Duncombe, Stanstead Abbots, Ware.

The class for seven blooms of any variety, Teas and Noisettes excluded, brought out seven entries, Mr. W. C. Romaine being placed first with a nice vase of Jeannie Dickson, Mr. E. M. Eversfield being second with Caroline Testout, and the Rev. H. A. Berners, Harkstead Rectory, Ipswich, third, with fine blooms of Madame Abel Chatenay. The exhibitors should be compelled to label their flowers.

The Ben Cant Memorial prize was offered for twelve blooms distinct, confined to growers of less than one thousand plants. There were eleven entries, and Mr. Thomas B. Gabriel was awarded first prize, the varieties being Mrs. J. Laing, Le Havre, Bessie Brown (good), Captain Hayward, Dr. Andry, Lady Mary Fitzwilliam, Prince Arthur, Frau Karl Druschki (quite gone), Madame Hoste, Général Jacqueminot, La France, and Marquise Litta. Mr. G. Moules, Hitchen, was a capital second, and Mr. E. Wilkins, Sidcup, third.

For five blooms in a single vase there were six entries, the first prize being awarded to Mr. G. H. Baxter, Brentwood, with Marquise Litta; Mr. F. R. Curtis, Colchester, being second with Mrs. J. Laing; and Kent brought up the rear, for Mr. E. Wilkins was awarded third with Marquise Litta.

The Grahame Memorial Prize was for growers of less than five hundred plants, nine blooms distinct. Here there were ten

contestants, who made a good show, Mr. C. Page, Earldoms, Enfield, winning well, with first-rate blooms of Bessie Brown, Ulrich Brunner, Frau Karl Druschki, Madame G. Luizet, Gustave Piganeau, Ulster, Caroline Testout, Tenyson, and Mrs. W. J. Grant. Mr. J. T. Thompson, Bounds Green, was second, and Mrs. E. A. Mouldon, Stevenage, third.

For six blooms, distinct, Dr. S. E. Pallett, Earl's Colne, was first with good examples of Bessie Brown, Kaiserin A. Victoria, and Mrs. W. J. Grant. Mr. A. C. Turner, Tatton, Edgware, was second, and Mr. C. F. H. Leslie, Hertingfordbury, Herts, third. There were eleven entries in this class.

For five blooms staged in a single vase, one variety, there were ten good entries. Here Mr. R. W. Bowyer, Hertford Heath, was awarded first position with a nice vase of Mrs. W. J. Grant, the Rev. F. J. Fulford, Foxley Vicarage, Glos., being second with La France, while Mr. A. C. Turner came third with Kaiserin Augusta Victoria.

Class 38 was for growers of less than two hundred blooms, six varieties distinct to be staged. Six exhibitors staged satisfactorily, and the first prize was allotted Miss A. M. Lucas, Hitchen, who had a good box, the best blooms being Madame Hoste, Madame Gabriel Luizet, and Kaiserin Augusta Victoria. Dr. Ernest Maltby, Feltham, was second, and Mrs. E. M. Wightman, Bengis, Herts, third.

Class 39 was for twelve blooms distinct, the first position going to Mrs. L. E. Simes, Hitchen, who had a strong, level exhibit, the best varieties being Marquise Litta, White Lady, Bessie Brown, Mrs. J. Laing, and Kaiserin A. Victoria. Mr. Geo. Moules was second and Mr. W. Kingston, Bedford, third.

For four trebles there were six entries, some staged in an unorthodox manner, the first prize being awarded Mr. W. Kingston for a fine display of Medea, Marquise Litta, Caroline Testout, and Kaiserin A. Victoria. Mr. E. Wilkins was second and Mr. G. H. Baxter, Brentwood, third.

The Ramsey Cup created a great amount of interest, and the competition was exceedingly keen, but Mr. W. Mease carried off the honours with a grand exhibit. The varieties were Bessie Brown, Madame Cusin, Souvenir de Madame E. Verdier, Dr. Sewell, Horace Vernet, White Maman Cochet, Gustave Piganeau, Mrs. Edward Mawley, Muriel Grahame, Maman Cochet, Kaiserin Augusta Victoria, and Ulrich Brunner—certainly the best box in the amateur section. Mr. Alexander Hill Gray was second, and the Rev. J. H. Pemberton third.

The novices turned out well with half a dozen distinct varieties, no less than fifteen exhibitors facing the judges. The first prize was awarded to Dr. T. E. Pallett, Earls Colne, who had a good level box. Mr. P. Sugden, Winchmore Hill, was second, and the Rev. J. B. Shackle, Maidenhead, third.

For six blooms, not less than four varieties, the competition was keen, there being twelve entries. The first prize was won by Mr. A. G. Farndon, Sutton, who had Mrs. J. Laing and Helen Keller, good. Mrs. E. M. Wightman being second, and Miss Du Buisson, Guildford, third.

A class was provided for exhibitors who had recently joined the Society. Strange to say that there were but three entries, the first prize going to Mr. H. T. Hinton, Heytesbury, Mrs. E. M. Wightman being second, and Mr. R. F. Lambe third.

The competition for growers within eight miles of Charing Cross brought out eight boards, some very good. Mr. W. J. Thompson, Bounds Green, being first with Mrs. J. Laing, Caroline Testout, and Bessie Brown in good form. Mr. W. G. Adcock, Torrington Park, being second, and Mr. E. R. Smith, Muswell Hill, third.

There were but two entries for new Roses. Mr. G. W. Cook, Muswell Hill, being first, and the Rev. J. H. Pemberton second, both exhibitors staging poorly.

#### Tea and Noisette Section.

The trophy class for eighteen blooms, distinct varieties, Teas or Noisettes, proved attractive, for there were five exhibitors. Here the veteran exhibitor, Mr. Alex. Hill Gray, proved the victor. The varieties were Mrs. E. Mawley (grand), The Bride, Catherine Mermet, Muriel Grahame, Bridesmaid, Medea, Ernest Metz, White Maman Cochet, Maman Cochet, Souvenir d'Elise Vardon, Devonensis, Madame Cusin, Cleopatra, Princess Beatrice, Comtesse de Nadaillac, Comtesse Panisse, Madame Hoste, and Princess of Wales. The Rev. F. R. Burnside was second with Madame Cusin, Mrs. E. Mawley, Sylph, Innocente Pirola, and Princess of Wales as his best flowers; while Mr. O. G. Orpen was third.

The Cocker Cup only attracted three exhibitors, the Rev. F. R. Burnside winning in first-rate style; his varieties were Mrs. E. Mawley, Medea, White Maman Cochet, Innocente Pirola, Catherine Mermet, The Bride, Souvenir d'Elise Vardon, Cleopatra, Madame Bravy, Maman Cochet, Muriel Grahame, Sylph, Rubens, Souvenir d'un Ami, Madame Hoste, Madame Cusin, Anna Olivier, and Caroline Kuster. Mr. Alex. Hill Gray was second with good blooms of Mrs. E. Mawley, Bridesmaid, Maman Cochet, and Princess Beatrice; while the third prize fell to Mr. C. J. Salter.

The Prince Memorial prize for eight trebles was represented by four exhibitors, Mr. Alex. Hill Gray scoring well; his varieties were Mrs. Ed. Mawley (good), The Bride, Bridesmaid, Innocente

Pirola, Medea, Catherine Mermet, Souvenir d'Elise Vardon, and Madame Cusin. The Rev. F. R. Burnside was second, and Mr. O. G. Orpen, third.

Class 50 was for seven blooms of one variety, the first prize being awarded the Rev. F. R. Burnside for a fine exhibit of White Maman Cochet; Mr. Alex. Hill Gray followed with Medea, and Mr. E. M. Eversfield was third with Comtesse de Nadaillac. There were five entries in this class.

The smaller growers were represented well in the class for twelve varieties, distinct, Mr. Thos. B. Gabriel being first with good blooms of Mrs. Ed. Mawley, Medea, Jean Ducher, and Bridesmaid. Mr. M. Whittle, Leicester, made a fair second, while Mr. R. Foley Hobbs, Worcester, brought up the rear with weaker flowers.

Class 52 for five blooms, one variety, was poorly represented, there being only two exhibitors, Miss B. H. Langton, Hendon, being awarded first for a vase of the Hon. Edith Gifford, while Mrs. H. A. Sivewright, Oxford, was second with Anna Olivier. For nine blooms distinct there were four competitors, Mr. G. H. Baxter being first, Mr. Arthur Munt, Slough, second, and Mr. F. R. Curtis, Wormingford, near Colchester, third.

For six blooms distinct there was a good entry of seven, the first prize falling to Mr. W. R. Hammond, Burgess Hill, whose best blooms were White Maman Cochet, Maman Cochet, and Ernest Metz; while Messrs. R. W. Bowyer and A. C. Turner followed in the order named. In the class for five blooms arranged in a vase made a poor display, although there were nine contestants. Mr. G. H. Baxter was first with Medea, the Rev. F. J. Fulford second with the same variety, and Mr. R. W. Bowyer third with Anna Olivier.

For four trebles there were three exhibitors, Mr. A. Slaughter, Steyning, being first, with nice blooms of Maman Cochet and Mrs. Ed. Mawley, the Rev. F. J. Fulford being second.

Class 57 was for six blooms, not less than three varieties. Here Mr. H. Clinton Baker, Bayfordbury, scored, with a nice even exhibit. The Rev. J. B. Shackle, Maidenhead, was second, and Mrs. H. A. Sivewright third.

#### Roses in Vases and Garden Varieties.

Mr. Alex. Hill Gray under this section was the only exhibitor in Class 59, and he deservedly was awarded first prize for good vases of Bridesmaid, Madame Hoste, and The Bride. Miss B. H. Langton was awarded first prize for five varieties of five blooms each, there being no other exhibitors. There were nine bowls of Roses, the best being from Miss Jessie B. Langton, Hendon, the second prize going to Mrs. O. G. Orpen, while the third was awarded to Miss A. F. Harwood, Colchester.

The competition was good in the class for a vase of cut Roses, but the weather played havoc with them in a few hours. Mrs. Ed. Mawley was awarded first honours, Miss Jessie B. Langton coming second, while Miss A. F. Harwood was third. Five beautiful baskets of Roses were staged, but Mrs. O. G. Orpen proved the victor with a pretty display; while equal seconds were awarded Miss J. B. Langton and Miss A. F. Harwood.

The class for table decoration was keenly contested, and the visitors seemed to deem it necessary to rejudge the exhibits, but an hour or so makes all the difference, which people appear to forget. Suffice it to say that Mrs. O. G. Orpen was awarded first with a pretty arrangement of single Roses, Mrs. Holland, Grange Road, Sutton, following, while Miss J. B. Langton brought up the rear.

Though there were only two exhibitors in the class for eighteen bunches of garden Roses, both were good. Mrs. W. Mease was to the fore with fine bunches of Crimson Rambler, Mme. A. Guinoisseau, Perle d'Or, Gustav Regis, W. A. Richardson, Irish Glory, Cecil Brunner, and Lady Battersea. The Rev. J. H. Pemberton was second with Madame Alfred Carrière, Purity, The Garland, and Reine Olga de Wurtemberg.

Class 66 was for twelve bunches of decorative Roses. Again there were but two competitors, Mrs. A. F. Perkins, Holmwood, Surrey, being first with nice typical bunches of Madame Chedane Guinoisseau, Claire Jacquier, Dr. Rouges, W. A. Richardson, and Camoens, the Rev. F. J. Fulford being second.

For six bunches of Sweet Briars there were three entries, Mrs. Horne, Reigate, being placed first, Mr. G. H. Baxter second, and Mr. Ed. Mawley, Berkhamsted, third. In the class for six bunches of decorative Roses Mr. A. C. Turner, Edgware, was first, while Messrs. Ed. Mawley and G. W. Cook followed in the order named.

The buttonhole Roses were attractive, Mr. O. G. Orpen being placed first for six bunches with Clara Watson, Anna Olivier, Impératrice Alexandra, Madame Hoste, Madame Ravary, and Ma Capucine. Mr. A. C. Turner made a good display for second place.

For five distinct varieties of garden Roses, not less than three sprays in a bunch, there was keen competition, but Mr. O. G. Orpen came out first, with good bunches of Purity and Lady Curzon. The Rev. J. H. Pemberton followed with smaller bunches, and Miss B. H. Langton brought up the rear.

#### Miscellaneous Exhibits.

Messrs. W. Cutbush and Son, Highgate, made a nice display of Carnations, Lantanas, and Verbenas. The Carnations were all

in pots, and the best were Lady Wolverton, Nautilus, Thora, Don Juan, Tintagel, Maggie Hodgson, Lord Welby, Florizel, Sheila, and H. J. Cutbush. Lantana Barnet Bronze was excellent.

From Messrs. H. Cannell and Sons, Swanley, came a fine display of Cannas, the chief varieties being Elizabeth Hoss, Maiden's Blush, Black Prince, Miss Amy Ker, Annie Laurie, Comte de Bouchaud, and Burbank; the whole being nicely displayed with Ferns and Palms.

Messrs. Dobbie and Co., Rothesay, contributed a nice display of Pansies and Violas. The former suffered somewhat from the heat, otherwise they were good. A few of the Violas were Ophelia, Lark, Emma Sophia, Meteor, Saturn, Christiana, Mary Charles, and Mary Robertson. The Pansies included most of the varieties seen at the Temple and Holland House exhibitions, the most noteworthy being Mrs. W. Watson, Maggie McPhail, R. C. Allan, Miss A. Brown, and Mrs. R. Fife.

Messrs. W. Spooner and Son, Woking, made a nice display of Roses, the back being composed of garden and decorative varieties, while the front was filled with the orthodox boxes. In the former were noted most of the Penzance Briars, Cecile Brunner, Madame Ravary, Souvenir de Catherine Guillot, Crimson Rambler, Leuchstern, Madame Abel Chatenay, and Madame Jules Grolez; while good blooms of Georges Schwartz, Kaiserin Augusta Victoria, Marquise Litta, Papa Lambert, Bessie Brown, Mrs. W. J. Grant, and Frau Karl Druschki were seen.

Messrs. G. Bunyard and Co., Maidstone, staged Roses in one hundred and twenty-five varieties. These were arranged in vases and boxes of the show type. Some of the best flowers were Souvenir de Président Carnot, Margaret Dickson, Clio, Anna Olivier, Madame Hoste, Mrs. W. J. Grant, Caroline Testout, Ulster, and Helen Guillot.

Messrs. Hobbies, Ltd., Dereham, made their chief feature Dorothy Perkins, in pots and in a cut state. The plants were masses of flower, the vases contained good examples of Lady Battersea, Mrs. J. Laing, Frau Karl Druschki, and Mildred Grant.

Mr. Geo. Mount, Canterbury, made a splendid display of Roses arranged with long stems, the chief varieties being Captain Hayward, Mrs. S. Crawford, Caroline Testout, Mrs. W. J. Grant, Mrs. J. Laing, Catherine Mermet, and La France.

From Messrs. G. Jackman and Son, Woking, came a fine bank of flowers, the back being composed of vases of decorative varieties, with a little Gypsophila elegans, while the front was made up of Roses in boxes, the chief varieties being W. A. Richardson, Papillon, Liberty, Gustav Regis, Madame Ravary, and Perle d'Or. In the boxes were most of the well-known varieties.

#### Isle of Wight Rose.

This annual show was held on June 26, in the grounds of the far-famed Carisbrooke Castle, and in radiantly beautiful typical June weather. The changing of the locale of the show yearly doubtless tends to maintain its still undiminished popularity, but it is open to question if a more romantic or fascinating site could be selected than the environs of these grand old ruins, of which Islanders are so proud. Many historical dramas, with issues of no common magnitude, have been enacted here, comparative mimic warfare, the incarceration of one of our Royal Sovereigns brings back to us conflicting emotions and memories and associations which to some the passing of the years has hallowed, and to all intensified.

The present season has not deigned to favour the efforts of rosarians, but the stands of Hybrid Perpetuals, were still almost perfection. Teas were undoubtedly exhibited in less quantity than in some former years, and below the average somewhat in quality. In the open classes Messrs. F. Cant and D. Prior and Son fully maintained the great reputation of their respective firms by setting up some grandly developed blooms in open class for twenty-four; conspicuous in first-named firm's stand being Mrs. F. Cant and Mildred Grant. In the latter's, two I most admired were Helen Kellar and Suzanne M. Rodocanachi. In the eight distinct varieties, three trusses of each, Mr. F. Cant had superb Oscar Cordell (this being also well represented in other stands). It was most pleasing to note such great favourites as Mrs. John Laing, Ulrich Brunner, and Marchioness of Downshire well to the fore in this class.

Coming to Island exhibitors, whilst many stands were distinctly good, Lady Campbell (gardener, Mr. Burdon) stood eminently first in most classes. Her finest blooms were Killarney, Mrs. Sharman Crawford, Mildred Grant, La France, Oscar Cordell, Clara Watson, Marchioness of Londonderry, La France '89, and Mrs. E. Mawley, a magnificent bloom. Mrs. Croft Murray, Mrs. Disney Leith, the Rev. Jeans, Mrs. Winthrop also staged some good blooms; and D. Soaton, Lymington, Hants, staged well in amateurs' class. The Garden Roses were very pretty and tastefully arranged, notable being Papa Gontier, Marquis of Salisbury, and Rainbow. The committee and hon. sec. are to be congratulated on completeness of arrangements.—SOUTHERN GARDENER.

[Owing to the numerous and lengthy reports of shows this week, a number of other notices are held over.]

### Fruit Forcing.

**FIGS: SECOND CROPS.**—The fruits on early forced trees have now swelled to a good size, and to insure a number of fine Figs they must not be overcropped, the foliage kept free from insects, and the feeding liberal. Early forced planted out trees should have the young wood ripened and be resting by the middle of October. Borders that have become dry must be watered to bring them into a moist condition down to the drainage. Liquid manure will be required by trees having the roots in borders of limited extent. Mulch lightly, and keep damped when it becomes dry, so as to encourage surface roots. Syringe daily, except in dull weather, when morning or early afternoon syringing will be sufficient, and always early enough to allow of the foliage getting dry before night. Judicious and forcible syringings are usually sufficient to keep down red spider, but if it gets a hold dislodge by means of an insecticide. Maintain a night temperature of 60deg to 65deg, and 70deg to 75deg by day. Ventilate early, especially on bright mornings. Keep the house through the day at 80deg to 85deg with sun heat, and close early, so as to run up to 85deg or 90deg, or even 95deg, providing plenty of atmospheric moisture.

**SUCCESSION HOUSES.**—When the fruit changes colour afford more air, insuring a circulation constantly. Reduce the moisture gradually, keeping it from the fruit, which expose as much as possible to light and air. Lessened supplies of water at the roots tell in favour of quality, yet they must not be allowed to suffer. Trees swelling their crops will be benefited by a light mulching of short material over the roots, and through this supply liquid manure in the case of trees carrying heavy crops. In fine weather syringe twice a day, always in good time, and close so as to run up to 90deg, 95deg, or 100deg. As the fruit approaches ripening provide a little ventilation constantly, putting it on just before nightfall, and let it remain, increasing it early.

**VINES.**—When the fruit has been cut, syringe the foliage well in order to preserve it as long as possible in a healthy state, for if the leaves fall early second growth not unfrequently sets in when they ought to be resting. A moderate extension of the laterals will usually prevent premature ripening of the foliage, and will not do any harm, but irregularities of growth, and particularly gross ones, should be checked by pinching, or be entirely removed. Admit air to the fullest possible extent, and maintain moderate moisture in the border, particularly at the surface, so as to keep the roots there instead of allowing it to become dry, and so causing them to descend in quest of moisture. Weakly Vines must have liquid manure occasionally, which will help them to retain the foliage, and assist them in plumping the buds and storing nutritive matter in the adjacent wood.

**GRAPES RIPENING.**—Afford plenty of air directly the Grapes begin colouring, with a little fire heat to insure a circulation of atmosphere constantly, and prevent the deposition of moisture on the berries during the night or in dull periods, which is one of the chief causes of "spot," especially in the case of Muscat of Alexandria. Maintain, however, a fair amount of atmospheric moisture to insure the proper swelling of the berries and the preservation of the foliage in health. Allow the temperature to fall to 65deg at night, otherwise securing a temperature by artificial means of 70deg to 75deg, and 80deg to 85deg through the day for Black Hamburgs and similar varieties with sun heat. Muscats should have a night temperature of 65deg to 70deg, 75deg to 80deg by day from fire heat, and 85deg to 90deg from sun heat. Supply water or liquid manure thoroughly to the inside borders, enough to reach the drainage, and a light mulching will keep the surface moist. Outside borders must be watered if dry weather prevail, always giving enough water or liquid manure to moisten the soil down to the drainage.

**GRAPES STONING.**—Ventilate early, so as to allow the moisture to escape and the atmosphere to gradually warm in order to avoid scorching, and a gentle warmth in the pipes with a little air constantly is the best safeguard against scalding of the berries. This, with free ventilation by day, and not closing early at this critical period, will usually ward off the moisture that, heated on the berries, causes them to scald. As the liability to scald does not extend over a period of more than a fortnight or three weeks, give particular attention in the late stages of stoning to the ventilation. In bright weather succeeding a dull and cold period there is most danger of scorching, and with the modern system of large panes of glass there is absolute necessity at such times from bright sun, especially for Muscat of Alexandria. A double thickness of herring net over the roof lights is very beneficial, and affords all the shade required.—ST. ALBANS.

### Kitchen Garden.

**CELERY PLANTING.**—All Celery plants, with the exception of those recently pricked out, will be ready to transplant finally into the trenches. Shallow trenches about 15in wide into which has been worked some decayed manure will provide a good rooting medium. They may be prepared on a piece of ground from which another crop has been cleared, at a distance of about 4ft or 5ft apart. Single rows are the most convenient, as the cultivation of Celery entails a considerable amount of trouble in trimming, earthing, watering. If space is limited double rows may be grown; but the trenches must be wider apart to allow of the extra banks of soil for earthing. The plants should lift with good balls of soil attached to the roots. They are then easily planted and soon start into vigorous growth. A suitable condition for lifting is easily ensured if the nursery bed is thoroughly moistened the day previously to planting. Plants that are short and sturdy are in every way the best fitted for planting, and entail less trouble. Those which do not possess a good ball of roots are almost sure to flag under strong sunshine, hence need shading until root action indicates that they are established. Plant in the evening or on dull days.

**SAVOYS.**—Providing that the plants in the seed beds, or which have been picked out to strengthen, are sturdy enough, they should be inserted in permanent quarters. The early varieties may be planted first, and these being dwarf and not requiring much room may be planted closer together than the more vigorous, large growing sorts. Tom Thumb Savoys may be planted as close together as a foot, while the larger varieties may be planted 15in to 18in apart, in rows 2ft asunder. The ground for Savoys may be moderately well enriched and dug deeply. It should also lay well open, and the plants ought to have the whole space, which is much better for growth than crowding them among Potatoes in order to economise room.

**CAULIFLOWERS.**—Plants recently placed out are becoming established, and ought, in order to aid growth, to receive frequent hoeings. Copious supplies of liquid manure will be of great assistance, not only in promoting immediate growth, but of storing nutriment in the soil for future use by the extending roots. Cauliflowers like rich living, especially if growing in an open position, so that they have the important advantages of abundant light to build up a sturdy habit with good leaves and fibrous roots. These will invariably be followed by close, compact heads, tender and white in autumn.

**TOMATOES.**—A considerable amount of systematic attention must be given Tomatoes planted out against walls and fences in the matter of tying, watering, rubbing out superfluous shoots, and setting fruit. A sunny position is essential, so that the wood made may be short and sturdy, the leaves of firm texture, and the flower trusses strong. A thoroughly healthy and moist condition of the rooting medium will best conduce to this, therefore the watering should not be neglected. Strictly confine the plants to one stem, rubbing out the side shoots as they form in the axils of the principal leaves. Do not adopt the system of curtailing these. If the plants have plenty of light and air and ample room the foliage will not be unduly large. Later on, if the leaves encroach and shade the fruit, some of the leaflets may be shortened back slightly, and any yellowing foliage at the base below the bunches of fruit may be removed. When a good set of fruit has been secured give the plants liquid manure, and a mulching of manure over the roots will prove useful. Heavy bunches of fruit ought to have a little support.—EAST KENT.

A week of bright summer-like weather, with a rising temperature towards the end.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**MELONS SWEATING (B. H.).**—In all probability the wet state of the Melons was the result of a too low night temperature and the consequent deposition of moisture by condensation, and possibly, also, you did not admit air soon enough in the morning. If you maintain a night temperature of 65deg, with a little ventilation at the top of the pit or frame, and open the ventilators further as soon as the heat rises in the morning, increasing the air with each 5deg increase of temperature, you will not be troubled with further "sweating," which is dangerous when so pronounced as described in your letter. The specimen was not in condition to be named. If you will send another so packed that it arrives in a fresh state it shall be attended to.

**STRAWBERRY FLOWERS GONE BLACK IN CENTRE (H. R.).**—The flowers are what is known as "blind," and is chiefly due to weakness of plant, the ovary parts being very defective, not being well formed in embryo, and consequently when the trusses of bloom are pushed for flowering they are seen to be dark in colour and soon become black. Possibly the plants have suffered from having the roots unprotected in the early part of last winter, which would have a checking influence on the crowns, and thus hindering the formation of the trusses of bloom in embryo, giving at flowering time nothing but blooms defective in the ovaries and pistillate organs, the male element in such instances being often perfected, the anthers supplying pollen; but the central part of the flower is brown or black, and fertilisation cannot be effected. As the leaves are very small we should attribute the failure to general weakness of plants, they not having had the proper treatment in autumn to effect the proper formation of the floriferous parts of the crown for the coming crop of fruit.

**EARLY CAULIFLOWERS GOING OFF (A. H. C.).**—The stems are what is known as maggoted, and the maggots accompanying the specimens are those of the Cabbage fly (*Anthomyia Brassicae*). The maggots are the cause of the mischief, they eating passages in the stems and roots, and sometimes destroy whole fields of Cabbages and other Brassicas, and often are very destructive of early Cauliflowers in gardens, which is probably owing to their being planted in very rich soil, or ground that has only recently been heavily manured, especially if this was new or rank. Our experience all tends to confirm prevalence of maggot presence after the application of much stable or farmyard manures. To grow Cabbages and Cauliflowers well without good well-enriched soil appears an impossibility; but new or rank manure should be avoided, as the Cabbage maggots are to be found in dung, as well as at the plant roots. Instead of applying and digging in manure at planting time, it, when necessary, being applied in the previous winter, a dressing of a mixture of three parts superphosphate and two parts bonemeal at the rate of 3½lb per rod should be applied at planting time, or in the case of seed sowing at sowing time, and when the plants have got well hold of the soil after planting, or after singling in the case of seed-sown plants, apply a dressing of two parts finely crushed nitrate of soda and three parts of salt—ground agricultural or rock salt preferably—3½lb of the mixture per rod, keeping it from the hearts of the Cabbages or Cauliflowers. This will give good results both as regards the freedom from maggots and in the crop. Where land is much subject to maggot a dressing of gas lime fresh from gasworks is a good cure. It should be applied a considerable time in advance of cropping, about ½cwt per rod, spreading evenly on the surface and leaving there a month or six weeks before digging in. This acts by killing the maggots existing in pupal state in the soil, and care being taken not to introduce them in or encourage attack by application of new or rank manure, there is seldom any mischief from the Cabbage fly. Watering the affected plants with lime water, soaking hot lime for twenty-four hours in water, and watering with this when clear, in the afternoon is known to destroy the maggots. A solution of two parts nitrate of soda and three parts salt, 1oz or 2oz per gallon of water is also destructive of the maggots. Plants that are attacked by the maggots may be easily known by their dull lead colour, and by the leaves drooping or flagging in the heat of the day.

**PEACHES AND NECTARINES FALLING (J. F., Godalming).**—The origin of the evil we attribute mainly to the powerful fumigations to which you allude at a critical period—namely, about the stoning time. Tobacco smoke in sufficient strength to kill the black aphid temporarily paralyses the trees, and the effect of this is seen sooner or later in falling fruit. Every endeavour should be made to prevent the insects getting established, and this can usually be accomplished by the free use of the syringe and such insecticides as may be needed for the purpose. The frost, if severe at the time you name, would aggravate the evil, but we can scarcely think it was so intense as to have such disastrous results; you do not, however, indicate its severity.

**PRUNING IVY AND EVERGREENS (E. R.).**—The worst time to cut Ivy on walls is just before "the cold weather sets in" in the autumn, as then the walls are bare and unsightly for months, besides exposing the stems to the action of possibly severe frost, and we have known them killed by such exposure. The best time to cut it is during showery weather towards the end of April or early in May, as then fresh growths appear at once, and a cheerful glossy face is produced. Once in three years is usually sufficient for shaving off Ivy close to the walls to which it clings, during the intervening years the runners simply being cut off with a knife, leaving the principal foliage. We know Ivy that has been thus managed for half a century, and in all probability more than twice that time, and it is in the most satisfactory condition. If evergreens need cutting down below the foliage, early spring is the best time; if the shrubs only need trimming into shape the work may be done at any time now until September.

**OUTDOOR MUSHROOM BEDS (S. L. B., Liverpool).**—Sawdust containing 70 to 75 per cent. of horse droppings, mixed with an equal quantity of straw manure, will answer admirably, provided you can make the ridges firm enough and the angle sufficiently acute to throw off the wet, and this we think you might accomplish by using a less quantity of sawdust with the manure for the outsides of the beds, or a larger portion in the inside would be permissible. If woodlice are very numerous they are injurious to Mushrooms. You will soon find out whether they devour yours or not. They are not very easy to destroy, but they will not congregate in large numbers if you keep the material that covers the beds moist with an occasional sprinkling of salt and water. Woodlice object to this, and Mushrooms do not, provided not more than an ounce of salt is mixed in each gallon of water. It may be well, perhaps, to intimate that this is about the worst period of the year for making outdoor Mushroom beds, unless their position is exceptionally cool.

**BARREN STRAWBERRY PLANTS AND THEIR RUNNERS (T. A. C. C.).**—As a rule it is not advisable to retain barren plants, and certainly bad practice to take runners from plants that have not produced fruit or flowered in the season of taking the runners. Such barren plants always produce earlier and much stronger and considerably greater number of runners than fruitful plants, and as a general rule are not worthy of keeping, as they almost invariably make much growth with a paucity of flowers and fruit. Sometimes, however, late runners, or those not planted until autumn or spring, as in field culture, make a vigorous growth in the summer following, and produce little fruit the first season; but in the second year afford a good crop. If the runners were taken from fruitful plants we do not see why they should not produce fruit another season, as probably the present barrenness is due to excessive vigour, though they certainly had not formed trusses of bloom in embryo, and this rather inclines to their being taken from barren plants or runners. In that case they are not worth keeping.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (A. L.).—1. *Polygonum molle*; 2. *P. saccalachiense*; 3. *P. Bistorti*; 4. *Morina longiflora*; 5. *Cepalaria tatarica*; 6. *Scabiosa longifolia*. (P. F.).—1. *Galium molugo*; 2. *Miscanthus sinensis*; 3. *Atriplex hortensis*; 4. *Salvia officinalis*; 5. *S. argentea*; 6. probably *Archangelica officinalis*. (Hortus).—1. *Elæagnus umbellatus*; 2. *Rhododendron myrtifolium*; 3. *R. hirsutum*; 4. *R. Wilsoni*; the *Dianthus*es were much withered; they are probably 5. *D. caesus*; 6. *D. suavis*; 7. unrecognised; 8. *D. plumarius*; 9. *D. fruticosus*; 10. *Lotus corniculatus*; please only send six specimens. (E. S. W.).—*Saxifraga Sibthorpi*.

## Trade Note.

Dobbie and Co.

We have just purchased sixty acres of fine, freehold land in the Essex seed-growing district. It lies alongside the main Great Eastern line, and is close to Marks Tey Station. We intend removing our seed-growing operations from Orpington to this new place next season.—DOBBIE AND CO.

## The Midsummer Outlook.

Though in the opinion of those best qualified to judge agriculture has been none too prosperous during the past twelve months, yet the fact that suitable tenants can still be found to cultivate the land goes far to prove that farming is not all loss, and we trust that this year of grace 1903 may bring not only a living but a fair profit to every good farmer.

We have arrived at a very critical point, and given good weather conditions we do not fear for the immediate future. Taking Cereal crops first, we may not be far wrong in saying that Wheat is promising. Certainly there have been attacks of wireworm and complaints of injury therefrom, but the attacks were but local, and entirely confined to recently ploughed up pasture, which has been grazed for two or more years. On the whole, Wheat looks well; it is not only of good length of straw, but sturdy of habit, and the ears which are appearing are long and well-developed. Last year at this time thin and patchy fields of Wheat were too frequently met with; this year we have not seen a bad piece, and we think the prospect for Wheat decidedly above the average, and it must be the premier Cereal crop of the year.

Barley, we fear, will be very variable, which is a fatal word to use in connection with it. More equable climates than ours have of late produced Barleys which have seriously competed with ours in the market for fine malting quality, and we cannot afford any discount arising from ungenial weather. Barley requires forcing treatment and a right-away growth without check. A check of some kind no doubt few fields have escaped, and if we should be fortunate enough to have a fair yield it is hardly possible to have fine quality. The yield will probably vary greatly, and as the poor, weak soils will be seriously deficient, it is probable that the crop will be well below the average.

Oats, of which a considerable acreage has been sown, are a little more promising than Barley, and if the portion of the crop sown after seeds were left out, the prospect might be quite up to the average. Oats after seeds, however, are anything but satisfactory. Wireworm has been very destructive to the plant, and the fields present a very patchy appearance. As the world's production of Cereals does not keep pace with the increase of the population, apart from the fact that Indian and other native races are increasing their average consumption per head, there is a reasonable prospect of firm to higher prices, especially for bread stuffs.

The price of bread is also likely to be affected by the prospects of the Potato crop, which is anything but bright just now. The planting generally was not done under favourable conditions, and thousands of acres which were forward in growth and most promising have been recently severely damaged by frost. At the present moment there is something approaching a famine in Potatoes, and unless the season should prove very favourable to the further development of the tuber, there is a prospect of higher prices than usual during the coming winter. The Potato crop is one which, under most favourable conditions, shows great powers of recovery, and it is unsafe to assume too much, but certainly at present the condition of the crop is not promising. An acre of Northern Star is reported sold for £500. We have heard £500 per ton quoted for seed delivered next planting time. There is a big margin between the two prices if the variety is a great cropper.

Mangolds will be very variable. A large acreage was sown two or three weeks after the usual time, and a considerable portion did not germinate until the rain came. There is plenty of plant, but these belated crops will not have time to develop into very large roots. The prospect

for Swedes is fair, and for common Turnips good. It has been rather too cold for the young early sown Swedes, and the later ones may be the best, but there has been plenty of rain in nearly all districts, and with anything like a warm summer we have confidence in forecasting a fair average root crop, if there is not a very big one.

Hay and Clover must be big crops. In some parts the dry weather brought about somewhat premature cutting, but there are few light crops, and many very heavy ones. Red Clover and Cowgrass are so thick on the ground that the weight per acre must be much above the average. That big crops of fodder are anticipated is shown by the fodder markets, which are much depressed. Old hay is almost unsaleable, and Clover is very cheap. The hay producer will have to hold his produce over or accept a poor price. Hay well saved and well stacked will keep a long time if the farmer has sufficient capital to play the waiting game.

The prospects of the stock owner are undeniably bright, the only dark spot being the low price of wool. Yet the longest lane has a turning, and wool buyers are showing some keenness in looking after lots. Prices are firmer, and we are informed that there is a chance of a return to more remunerative rates. We used to regard 21s. per tod as a ruinous price. We shall feel like millionaires when wool reaches that price once more.

The crop of lambs was a good one, and the season has been a record one for immunity from disease and loss. Prices have kept at a high level, and are likely to remain there, at least for a time. There is plenty of keep, and if our expectation of a fair root crop is realised farmers will be in a position to hold their sheep and dictate prices to the consumer. Foreign supplies are not large enough to materially affect the situation. Beef, too, is likely to make a fair price; the good supply of straw and hay will provide ample food for the winter, and there should be little need for the farmer to sell his cattle before they are well primed up.

Pig feeding does not promise well. Young pigs are still dear, far too dear for the price of pork, which now makes little more than 5d. per lb. If American imports soon return to their old level we shall have a poor trade for pig products.

## Work on the Home Farm.

A gloriously fine week has seen a large breadth of Turnips sown under ideal conditions, and this work being satisfactorily completed we can turn our attention in earnest to the making of hay which we were about to commence when the rain came. The rain washed the dust off the grass, but has not greatly increased the crop, and as the weather appears settled we will go on with the work at once. Two grass reapers will soon cut the crops down, men being set to work with scythes to mow the corners out and all banks and occupation roads; the rough grass from the banks and corners will be used to top the ricks with.

We have just noticed the first ears of Wheat, so can fix the commencement of the corn harvest for August 14. If Turnips have a good growing time we shall be able to get all nicely hoed and cleaned before harvest. Swedes are not nearly big enough for striking out, but we are looking the Mangolds over for doubles, and weeds which have revived in somewhat alarming numbers since the rain. They have had another skerrying, as also have the Cabbages. We have plenty of moisture in the soil now, and we must keep the surface fine to conserve it as much as possible. Horse hoes too often lie in the shed when they should be at work. If there are no weeds to kill farmers are apt to consider skerrying superfluous, but it is a great mistake; for surface stirring is absolutely necessary apart from its action in destroying weeds. We have noticed that farmers who have been late in cleaning their Turnip fallows, and have had a good deal of rubbish to work out and get off when other farmers were drilling, were generally successful in getting good Turnip crops. This we attribute to the thorough stirring and aëration which the land received at the last stage, and if thorough stirring is good before drilling, surface stirring must be beneficial afterwards.

Bullocks are doing better, but not so well as they have done in many seasons, and the cost of the cake continued for a longer time will tend to reduce the profit. Fortunately cakes are a little cheaper, the inevitable result from the great plenty of natural food.

Mares with early foals are now turned away on grass. An allowance of corn is not necessary, but politic; for both mare and foal will be better for it, and the latter will be getting educated to look out for itself. Seven pounds per diem of crushed Oats and bran will cost about 3s. per week, and the foal will pay for it in increased growth and substance.

**For Present Planting.**

## ROMAN HYACINTHS

FOR many years we have made the above a very special line. Owing to the high standard of quality at which they are maintained, our sales largely increase each year. They now amount to hundreds of thousands of bulbs annually.

**WE APPEND EXTRACTS FROM A FEW RECENT TESTIMONIALS:—****LEEDS, June 4th, 1903.**

The Roman Hyacinths supplied the last two years have been very fine indeed. They were admired by everyone who saw them.

**WARRWORTH, May 25th, 1903.**

The Roman Hyacinths supplied by you last year were entirely satisfactory, as I have invariably found them to be.

**WEST HARTLEPOOL, May 26th, 1903.**

I cannot speak too highly of the quality of your Roman Hyacinths which we got from you last autumn.

**NEWCASTLE-ON-TYNE, January 6th, 1903.**

It gives me great pleasure to inform you that the Roman Hyacinths supplied by you have been remarkably fine, and I am well pleased with the same.

**HARROGATE, June 3rd, 1903.**

Bulbs supplied by you, especially the Roman Hyacinths, turned out excellent, and were much admired by visitors to the hotel.

**CO. LIMERICK, May, 1903.**

Having grown for several seasons a good quantity of early white Roman Hyacinths supplied by you, I feel it my duty to say I always found them of first-rate quality. I have often counted as many as five and six spikes on a single bulb.

**KEIGHLEY, October 16th, 1902.**

The white Roman Hyacinths received from your firm in July are now in full bloom and are very fine indeed; never had a better lot.

**WEST HARTLEPOOL, June 8th, 1903.**

I have great pleasure in informing you that the Roman Hyacinths I had from you last year were very fine, and the best I saw in the district.

### Co-operative Banks.

*(Concessions recently granted by the Treasury.)*

“UNION is strength” has been a recognised truism from remote times, but although mankind has for ages grasped the idea to some extent, and applied it in various forms, it is equally certain that the grand possibilities of union—co-operation—are only beginning to dawn upon the people of this country; and when later these possibilities shall be fully realised, tasks which seem impossible to-day will be successfully carried out with comparative ease. The value of co-operation might be illustrated in many ways. Here is one: the numerous threads of a rope are weak and insignificant in themselves, but when hosts of them are woven together they form a mighty whole of surpassing strength.

Many who are interested in rural pursuits can see clearly that the time has now arrived when co-operation in its various forms is imperatively necessary, in order to secure for small holders the fullest reward for their labour. Among other methods of combination, village co-operative banks—if started on business principles and conducted with proper safeguards—may be made the means of bringing prosperity to many rural districts where at present the land “crieth for the tiller,” and where waste and ruin stalk abroad. The co-operative bank movement has long passed the experimental stage, as a society was founded in this country as long ago as 1894, which has been highly successful, and is now appreciated more than ever. The promotion of such societies in England has hitherto been greatly hampered by the registration fee of £1, modification of rules fee 10s., and other regulations. Early this year, however, a memorial to the Treasury was drawn up by the Co-operative

No. 1202.—VOL. XLVII., THIRD SERIES.

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to “THE EDITOR,” at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

Banks Association asking for the removal of these restrictions, and presented by them in conjunction with the Irish Agricultural Organisation Society and the Agricultural Organisation Society (England). These important concessions have now been granted by the Treasury, and henceforward village credit societies in England should rapidly increase in number.

The late Mr. R. W. Hanbury, M.P., was the first leading statesman in this country to grasp the beneficial possibilities of co-operative credit, and but for his untimely death would have been the principal speaker at a meeting which was being organised by the association for May last. On December 1, 1902, Mr. Hanbury made the following remarks at Aberystwyth:—

There is another experiment which I should like to see made, especially in a district of small farmers. The system of agricultural banks has been carried out almost universally on the Continent, and has been a great success in Ireland. I believe that to a community of small farmers these banks would be invaluable (hear, hear). They are not for the purpose of borrowing large sums of money, but we know that there are particular times in the year when £2 or £3 might be as useful to a small farmer as £20.

It might enable him to avoid the necessity of selling an ox or a cow, which could be kept to ultimate profit, by meeting the demands of the moment. In agricultural banks, I think, a way might be found of tiding over an evil day, and it is to help of this kind that many a farmer owes his rise in life. From a failure he has become a success. There are a hundred ways in which such banks might be of great use. All these considerations that I have been putting before you are not mere theories. If they were I should not be here saying a word in their favour, because I feel that farmers cannot afford to make experiments. But when these things are carried out with great success under similar conditions on the Continent and in Ireland, for the life of me I cannot see why they should not also be a success here.

The support of so influential and practical a statesman as the late Mr. Hanbury would doubtless have done much to promote the establishment of agricultural banks; but although he has been snatched away in the zenith of his usefulness, his clearly expressed ideas on this subject should stimulate others to help forward a movement capable of doing such a vast amount of good. A network of village credit societies should be gradually formed throughout this country. To direct the establishment of co-operative banks in town and country districts a national association has been formed on lines precluding personal profit by its members. Mr. R. A. Yerburch, M.P., is chairman; the following are the vice-presidents: The Countess of Warwick, the Earl of Coventry, Mr. F. S. W. Cornwallis, Major W. Evans Gordon, M.P., Mr. R. J. Price, and Mr. W. C. Steadman, L.C.C. There is also a strong council, which includes the Rt. Hon. Horace Plunkett, the Earl of Stamford, and Professor Bottomley; Mr. H. C. Devine being the energetic and enthusiastic secretary.

The objects of the society are clearly defined in the following particulars, sent out by the association, whose office is at 29, Old Queen Street, Westminster, S.W. They are as follows:

#### PEOPLE'S COUNTRY CO-OPERATIVE BANKS.

The need of cheap credit for the productive and economic purposes of farmers, small cultivators, allotment holders, and the labouring classes generally is very great. Big tenants, as a rule, can obtain monetary advances from joint stock banks at a fair rate of interest, thereby earning a more substantial living than would otherwise be possible. The object of the Co-operative Banks Association is to help smaller people to obtain similar advantages, by combining together, and pledging their united liability, so as to secure advances from capitalists at a low rate of interest, and lend the money out amongst themselves. At present their business is not considered worth the attention of the banks, and they either have to struggle along as best they can, or apply to a money-lender, which is worse, as to borrow money from advertising usurers generally means misery and ruin. The large number of bills of sale in the names of farmers, dairymen, gardeners, &c., conclusively proves the necessity for reasonable methods of obtaining credit amongst the agricultural population.

In addition to assisting those already on the land, people's country co-operative banks would undoubtedly be a means of increasing the number of small holdings, of the nature of those promoted by Lord Carrington on his estate in Lincolnshire, by which, besides the tenants, landlords and large farmers would also benefit, the first by prompt payment of rent, the second by the increased amount of strong, willing, able labour in their neighbourhoods. Co-operative banks, in creating the necessary financial credit, would go a long way towards stemming the prevailing drift into towns, and raising the independence and morale of the industrial community. If established generally, they would be a great aid to farm labourers to add to their small wages by the purchase of pigs, poultry, &c., and repay the outlay from profits.

On the Continent country credit societies of the kind advocated have worked wonders in increasing the comfort of the people, and exterminating usury. The Raiffeisen Agricultural Banks Associa-

tion, which has now over 2000 affiliated societies, boasts that neither member nor creditor has lost a farthing by them since the establishment of the movement in 1849.

In organising a country co-operative bank there are certain rules, regulations, and principles which are of the greatest importance. The first is the unlimited liability of members. All risk can be safeguarded by a standing order limiting the sum to be lent to any individual member, without a special resolution of a majority of the committee of management, and also the total amount to be loaned.

It is also vital to the success of the bank that no person shall be admitted as a member who has not a high character for sobriety, honesty, and integrity. Unless members of co-operative banks are persons of good character capitalists have no security in lending to them, and will naturally abstain from doing so. An entrance fee of 6d. may be charged. It is not necessary to have shares, but if they are adopted they can be as low as 2s. 6d. or 5s., payable by instalments, so that even the poorest may not be excluded.

In order that members shall be fully acquainted with one another it is absolutely necessary to limit the area of each society to a small district. When one parish is too small, two or three can be joined together. The ideal population for a bank district is between 1000 and 2000.

Each member has one vote only, and should fully realise that he is responsible for the transactions of the bank. There must be an executive committee, secretary, treasurer, and board of supervision, elected at annual or quarterly meetings of the whole membership. The duties of the committee are to admit members, grant loans, and fix the rate of interest for borrowers and depositors.

Loans are only granted to members. They are also granted solely for profitable, productive, or economic purposes, such as the purchase of manure, seeds, poultry, pigs, cows, greenhouses. Full time will be allowed for the borrower to make his profit out of the loan before repayment. As no dividends are paid to members, the rate of interest will be the lowest possible, co-operative banks being run in the interests of the borrowers; members making their profit by means of, but outside of the bank.

Every applicant for a loan must offer in addition to his own personal security, that of one or two of his friends who are willing to guarantee to repay the loan in full to the bank with interest, if the applicant himself fails to do so. The executive committee must satisfy themselves as to the reliability of these sureties.

The bank will receive deposits and pay thereon at least 3 per cent. interest, which is more than the Post Office Savings Bank. The security offered is the joint unlimited liability of all the members, combined with regular statements of accounts and a yearly public audit. By depositing their savings in a bank of this kind, men and women will not only secure more interest, but be helping their neighbours by circulating money in their own districts for productive purposes, under proper safeguards. The deposit department also affords a useful opportunity for richer people, who do not require to borrow, to assist in this movement for raising the tone of village life without giving, which it is believed will be fully taken advantage of. A set of model rules and also any further information required to start a co-operative bank on the above lines at once in affiliation with the Central Association, may be obtained from the Organizing Secretary.—HENRY C. DEVINE, Co-operative Banks Association, 29, Old Queen Street, Westminster, S.W.

A few illustrations will give some idea of the possibilities of usefulness of such societies:—

Case 1.—A farm labourer, an industrious man, who had brought up a large family, and had managed to save a little money. He took half an acre, then three acres and the proverbial cow. Then, when nearly sixty years old, seized the opportunity to hire a small farm of fifty acres, which he managed to enter and stock, except with sheep. To purchase these, the society granted him a loan of £30 on the security of his live and dead stock and corn in stack, which he insured at the instance of the society for £150. But for this loan the borrower would have had to sell his sheep food to his own loss, and to the damage of the farm. Having punctually discharged his debt, he applied for a fresh loan of £40, again to buy sheep, as his roots were more plentiful than during the previous season. The loan was granted on the same security as before, and duly discharged. A further sum of £20 was granted, and paid off to the day. After a year the borrower saw a chance of placing his sons on a small farm, which he practically stocked for them. In order to do this, however, and replenish his own holding, he applied for another loan of £50, which was granted on the same security. This chain of loans, therefore, assisted in starting the tenants of two small holdings, and it is estimated that if the original borrower were now to go out of farming after six years, he would be found to have quadrupled the capital with which he started.

Case 2.—One member borrowed £10, and bought some ewes, which, with their produce, more than doubled the amount before the time of repayment (twelve months) arrived.

Case 3.—A £20 loan to another member to repair his Cucumber and Tomato houses prevented them going further into decay, and probably getting past repair.

Many other equally striking examples might be given;

but I think enough has been advanced to show that there is an untold field of usefulness open to village credit societies. The method of working them is such as to assist the honest, self-reliant, and industrious; but to leave severely alone the laggard, intemperate, and thriftless individual. A strong incentive is therefore provided for the latter class to qualify for the former one.

In conclusion I should like to emphasise the fact that the above association is *not* a bank, but a non-profit-making, non-political society for showing small cultivators, tradesmen, and the working classes generally how they can form co-operative banks of their own in towns or villages. All persons desirous of doing so should write to the secretary at the address already given, who will be pleased to forward any particulars required. All, however, should bear in mind that "without preliminary union there can be no such thing as co-operative credit."—W.

## The Late Mr. William Thompson.

We regret to have to record the death of one of the oldest inhabitants of Ipswich in the person of Mr. William Thompson, of Haslemere, Bank Road, who passed away on Friday, the 3rd inst. The deceased gentleman was an octogenarian, and death was attributable to natural decay. Mr. Thompson, who leaves a son (Mr. Sidney Thompson) and three daughters to mourn his loss, had resided in Ipswich all his life. He married Miss Fisher, of Yoxford, who predeceased him in 1884. As a young man the deceased gentleman was always deeply interested in science. He began by studying chemistry and photography, and was one of the earliest pioneers of the old Daguerreotype method of photography. In pursuance of that hobby he travelled extensively in his younger days, and took a series of photographs, which would still be extremely interesting, even though the method is quite out of date. Some of his photographs of Old Ipswich have been reproduced in various archaeological and other publications. After a time his health began to fail him a little, and he turned his attention to botany, his pursuit of that science being at the outset purely a hobby. Little by little he began the exchange and sale of rare seeds, and he published his first catalogue in 1855—a very slim volume, that compares rather quaintly with the large books that are issued by the firm nowadays. His speciality was always herbaceous and Alpine plants, and he never cared much about exotics. Through many correspondents in all parts of the globe he gradually was enabled to introduce to the English gardening world a large number of plants hitherto not brought into cultivation.

Mr. Thompson's first noteworthy success was with *Rhodanthe maculata*, which in 1863 he introduced from Swan River, Western Australia. This had a great vogue, and is still one of the favourite Composites in decoration. In the following year he introduced two more varieties of the same plant—*R. alba* and *R. atro-sanguinea*. After that the flower that brought him most note was the beautiful *Aquilegia cærulea*, which, with *A. chrysantha*, was the first parent of the many splendid varieties of the long-spurred *Aquilegia* that have since become very common; indeed, that really opened the door to all the hybrids. His introduction of *Godetia Whitneyi* and *Leptosiphon roseus* rendered 1871 a year memorable in the gardening world. In later years his greatest find was the lovely *Phacelia Campanularia*, which he introduced from California in 1885, and about the same time he also brought in the *Clematis coccinea*.

As an illustration of the esteem in which he was held by botanists for his enterprise, it will be interesting to quote a dedication by Sir Joseph Dalton Hooker, then Director of the Royal Gardens at Kew:—"Vol. 32 of third series, 1876. This volume of the 'Botanical Magazine' is dedicated to Mr. William Thompson, of Ipswich—to whose zeal in introducing and intelligent skill in raising hardy American plants, and especially those of the Western United States, European gardeners in general, and the 'Botanical Magazine' in particular, are indebted for many most interesting and ornamental novelties—by his faithful friend, Joseph D. Hooker, Royal Gardens, Kew, December 1." Mr. Thompson's friends included such men as Charles Darwin, Sir Michael Foster, Dr. Asa Gray (the great American botanist), and his gardens have made Ipswich a Mecca for botanists of all countries. That the merits of the deceased gentleman were not only recognised in this country, but also abroad, is shown by the fact that in Diamond Jubilee year (1897) he was decorated with the gold Victorian Medal of Honour for his services to botany. It has been said of him that to carry on his work, handicapped as he was by a physical infirmity, was in itself an act of heroism in his devotion to science.

Mr. Thompson edited a monthly magazine called "The English Flower Garden," which began in 1852-3. It was illustrated by exquisitely coloured reproductions from hand paintings by Fitch, the great flower painter; but these proved too elaborate to yield

a profit, and the venture was abandoned. In 1855 he published "The Gardening Book of Annuals," a kind of gardeners' guide. This was followed in the next year by a supplement, and a year or two ago—as the work had gone entirely out of print and was very rare—he was pressed to bring out a fresh edition, and he had sketched out and largely completed a much more imposing edition.

The deceased was a man of wide interests, great reading, marvellous memory, and an extremely good linguist. He was of loveable disposition, and displayed an old-world courtesy, combined with entire simplicity of character. It is interesting to recall that, despite his rather hermitic habits, he insisted on being taken to the Town Hall on the occasion of the proclamation of King Edward VII., and intimated that he had also been present when Queen Victoria was proclaimed in 1837.

To allude for a moment to the strictly business side of Mr. Thompson's career, it may be said that from the first garden plot, started something like half a century ago, the business developed into one that is now widely known. Mr. John Morgan had been connected with it for over thirty years, and when the commercial side became too heavy for Mr. Thompson, he took Mr. Morgan into partnership. Without losing anything of its scientific character, the business extended so much that instead of the original small garden there are now three large nurseries in Ipswich.

The interment took place on Wednesday at Ipswich Cemetery.

## *Lilium pardalinum*.

Though there is something almost barbaric in the colouring of *Lilium pardalinum*, the Panther Lily, yet this North-west American species is always appreciated where it grows well and reaches its full stature and the size of flower, together with healthy foliage—all the symptoms of its being in favourable conditions. Its red and orange flowers, spotted with brown, are Eastern-like in their opulent colouring, though hailing from the far west, and have all the glowing effect we find in the most regal race of the queenly flower to which they belong. Such gorgeously coloured blooms cannot but arouse in the mind of the lover of the Lily a desire to possess *L. pardalinum* and to cultivate it to perfection. Though many attempt the cultivation of the Panther Lily, the number of bulbs lost annually from want of care is enormous, and it is solely due to that "rule of thumb" practice which is the bane of gardening that this effective Californian Lily is so seldom seen in health and happiness. A glance or two at its natural habitats will, however, be helpful to those who seek to enjoy in its fulness the fine colouring of the Panther Lily. By the coast line of the west of North America from Vancouver Island to California, *Lilium pardalinum* is to be found in plenty, though its leaves and flowers show signs that it is not in its most congenial home. This is to be found inland, where, by the banks of streams and in sunny recesses, moisture, sunshine, and shelter can all be enjoyed by this fine *Lilium*, which there attains to a height of from 6ft to 9ft, and which forms great clumps several feet across. We are not familiar with it in such proportions here, though there is no reason why it should not be in such masses as in its native land. It has been as fine in some places where its requirements have been studied, and many more might have it thus, so rapidly does it increase, and so easily does it grow.

Its prime requirements are plenty of moisture, a boggy soil, and full sunshine, and one who has plenty of space might do worse than plant a wet meadow with *Lilium pardalinum*, feeling assured that, barring accidents, it would in a few years be a sight for the gods to admire, a source of delight to all who gazed upon it. In a warm climate and with a dry air it may linger in life but it will be neither so healthy nor so happy. Planting is best done as soon as the bulbs can be procured, which is in autumn, or it can be delayed until spring, though I like to keep these Lilies as short a time out of the soil as possible. It does not require to be deeply planted; I should make 6in the maximum, but it will thrive quite well with merely the barest covering of soil above the rhizomatous bulbs. Three inches I look upon as a fair depth for the crowns. They seem absolutely hardy, as I have had bulbs which were barely covered uninjured by intense frosts. While *L. pardalinum* is all the better for a few inches at least of moist soil underneath, it is wonderfully accommodating, and I have it doing well here with its bulbs only an inch or two above the concrete shelf at the edge of a little aquatic tank. The soil, however, is just what it likes, and it has always plenty of moisture. Its liking for sunshine is shown by its having been less vigorous this season, when the solar rays have been too scarce for many things, and by the shorter stems yielded by bulbs planted in half-shaded positions. There are several varieties of *Lilium pardalinum* offered in the trade, but imported bulbs will generally give a considerable variety, though, of course, this depends largely upon the place in which they have been collected. A capital form is known as *Bourgæi*, but almost any variety will be sure to please.—SOLWAY FRITH.

### *Cypripedium spectabile.*

This western United States hardy *Cypripedium* might be named the finest bog plant of its own season, which is the present time. The Moccasin Flower, as it is also called, flourishes in cool, moist, half-shaded spots among peat and fibrous loam. No finer bed can be seen than the one in the rock garden at Kew, and here it is at home. Should increase be desired, the crowns can be divided in autumn, but only strong plants should be so treated. The flowers are exquisitely beautiful, having a rosy carmine lip, and white sepals and petals, delicately shaded with rose or blush. It deserves much wider culture.

### The Week's Cultural Notes.

*Lælia purpurata* is one of the grandest Orchids now in flower, and to ensure a fine display next season the plants should be kept as quiet as possible after flowering. I never like to see them growing away in late autumn, for the pseudo-bulbs are never so strong or the flowers so freely produced as on stems that come right away in spring after the plants have had a good rest during winter. It may be asked, How can the plants be prevented from growing? This is rather difficult at times, but the recognised method is to thoroughly ripen or consolidate the present growth and lower the temperature somewhat afterwards.

It is not so easy to do in the case of this beautiful *Lælia* as in that of a *Dendrobium*, as those who have tried have found. The foliage is more easily injured by exposure to sun and air, while at times no amount of care will prevent growths starting. In such cases grow them on as rapidly as possible, and endeavour to finish the stems by the early winter. It is not too late to top-dress the plants should roots appear to be starting, but the best time for repotting is past, this being in spring, when the young shoots are just beginning to push roots on their own account.

Another species now in bloom is *Lælia Boothiana*, or *lobata*, as it used to be called. This Orchid is singular in thriving upon apparent neglect, and if kept well potted on in new compost every few years will never flower, though it will increase and multiply very rapidly. On the other hand, leave it alone to starve, as it seems, in its pot, leave it until the new growths hang all about over the edges, and do not treat it any too well with regard to watering, and the probability is you will be rewarded by an ample display of its charming blossoms. *Lælia Boothiana* is found in Rio de Janeiro growing fully exposed to the hot sun upon bare rocks, and this treatment is necessary to flower it satisfactorily.

*Lælia majalis*, or the Mayflower, should by now have almost finished its growth, and when complete the plants should be placed outside right in the eye of the sun and watered as often as necessary. This, too, will not flower if kept growing under the usual conditions all the year round. It must be thoroughly ripened by exposure; but, given this little attention, it is a most lovely plant, its blossoms very large in comparison with the size of the growth, the colour a pretty soft pink or rose, with purple markings on the lip.—H. R. R.

## Calceolarias at Bolehall Manor House.

Tamworth has during recent years become well known to horticulturists on account of the widespread popularity of Mr. W. Sydenham's Violas and Pansies. To visit the neighbourhood without seeing them is almost an unpardonable omission. I do not, however, plead quite guilty, as I passed the entrance gate and saw the brilliant glow of colour in the distance. My time was extremely limited, or I should certainly have endeavoured to find out the latest varieties in Violas; but I had to be content with inspecting, and thoroughly enjoying, a feature in the delightful garden of the Rev. W. MacGregor, on the opposite side of the road.

I had previously heard of the fine display of Calceolarias which Mr. G. Higginson each year provides for his employer, and was therefore determined not to miss the opportunity of seeing them, and I was fortunate in catching them in almost the full tide of beauty. The plants were arrayed in the well-kept conservatory, and my impression on seeing them was that there is nothing to equal these favourites of the older florists

for providing a beautiful and varied display during May and early June. Many of the specimens were of a stamp which prominent exhibitors might well envy, and such as only masters in the art of growing can produce. No matter whether they were growing in 6in, 7in, or 8in pots, the same sturdy vigour was noticeable throughout, the amount of growth being in proportion to the size of pot.

The individual flowers were as remarkable for their size and substance as for their delightful and varied markings. It would require a bold man to attempt to accurately describe the colours and markings of this fine strain of Calceolarias. I certainly will not court failure by trying to do so, but instead will urge all gardeners who have the opportunity to grow plants for another year. In this case the seed was obtained from the well-known firm of Dicksons, of Chester.

Mr. Higginson sows his seed sometimes during June, in pans placed in frames or handlights in a cool position in the open air. Strict attention is paid to pricking out and potting on the young seedlings and plants before they become crowded or root-bound. Light sandy soil freely intermixed with leaf soil is used in the early stages, and at each successive potting the compost is made slightly heavier, a little well decayed manure being employed at the final potting. That arch enemy, green fly, is kept at bay by repeated fumigations before they have time to establish themselves, and by careful attention to the numerous other details of culture. Few plants will show the result of neglect more quickly than this type of Calceolaria, and neglect of any description means trouble with insect pests; but when skill and constant attention are bestowed upon them, then the "harvest" is a brilliant and fascinating one. All should bear in mind that now is the time to make preparations for next year's display.—H.

## Tapton Grove, Chesterfield.

About two miles from Chesterfield lies Tapton Court, and at a recent visit we found Mr. Bloxham, the courteous head gardener, who readily placed his time at our disposal, and conducted us over the beautiful grounds. Entering a picturesque dell by crossing a stream, we found ourselves in a lovely spot by the lake, whereon disported waterfowls and majestic swans. The lake is well stocked with fishes, and one can fancy how pleasant it must be in summertime to board the boat, and to spend some time amongst the birds and these dwellers in the waters. Rising almost from the lake side is a stupendous bank, but along the foot we notice Lilies and Primroses and clumps of *Narcissus* (the month was May), while Pampas Grass is growing by the lake side, and an effort is being made to naturalise the bank with well-known flowers. Mounting by a winding walk, we come upon pieces of rockery, in which numbers of rock plants are growing. *Primula japonica* and *P. rosea* do well here, and are covered with bloom. American Cowslips, *Ericas*, &c., are dotted about, and one sees the *Fritillaria* also. Clumps of Ivy growing in, and covering tree trunks, are conspicuous.

The alpine garden is a pretty feature, and Grape Hyacinths, Saxifrages, Aubrietias, Azaleas, &c., luxuriate therein. Here one sees a very fine, soft Shield Fern fully 18in. across the crown. Throughout this garden water is laid from a spring some distance away, in such a manner that there is a constant trickling. Passing on, we notice Alpine Phloxes doing well, and there is a choice collection of Tulipas (species), including *retroflexa* and *fulgens*. *Arabis* has a pretty effect: *St. John's Wort* and *Berberis* are at home here; *Rock Cistus* and *Veronicas* all do well, and there is a fine collection of Daffodils. All the leading varieties of the latter are here, and some blooms secured honours at the Birmingham Show. We also noticed a very fine lot of Chrysanthemums, about 300 being grown, and Mr. Bloxham is a noted grower. Hybrid Primroses make a fine show, and evidently Sweet Peas are a favourite item.

Coming to the glass houses we find in the early vinery Muscat Hamburgh looking remarkably well, with fine growth, a good crop, and good bunches. In another house Hamburgs and Alicantes look very promising. Tomatoes are doing well, and show some fine fruit. The Tomato house was erected specially for these plants, and they are very flourishing. Peaches and Nectarines both show a good crop. In the stove there were a fine lot of *Calanthe Veitchi* coming away wonderfully strong; and of *Pandanus Veitchi* there are some grand table plants. *Abutilon Sanderianum*, *Crotons*, *Acalyphas*, *Anthuriums*, and a fine lot of *Gloxinias* (Peed's strain) are all good. A *Begonia*, *President Carnot*, in flower almost occupies one end of the house. There is a nice collection of *Caladiums*, including *Madame Groult*, *Jonville*, *Madame Fitz Kochlin*, *Raymond Lemoine*, and *Raoul Pugno* with its transparent leaves. On the roof are *Clerodendrons*, *Bougainvillea glabra*, *Plumbago rosea*, and *Allamandas*.

We noticed nice pieces of *Oncidiums*, *Dendrobiums*, *Cattleyas*, and *Begonia Godseffiana*. In a pretty fernery is an arch of tufa, in which *Adiantums*, *Pteris*, and *Rex Begonias* luxuriate, and it has a very pretty effect. By-the-bye, tufa seems to suit Ferns immensely; they seem to fairly revel in it. *Adiantum gracillimum* and *Asparagus*, and some fine baskets of *Davallias* are noticeable. In the flowering house were *Viburnum plicatum*, *Cyclamens*, Ivy-leaved *Pelargoniums*, *Souvenir de Charles Turner*, wonderfully good, nearly all across the top of the house; *Azaleas*, *Fuchsias* in flower on the roof, and a basket of *Lachenalia tricolor*, with an immense lot of flower, each call for special attention. We also noticed Sutton's Improved Telegraph Cucumbers doing well.

The Rose garden is a pretty spot, and reached from the terrace near the house overlooking the alpine bank of which we have spoken. Sweet Peas are, as we have said, a speciality at Tapton Grove, and clumps of choice varieties are numerous. The mansion is very prettily and pleasantly situated on an eminence. It stands in its own grounds of 120 acres, of which the gardens occupy about four. The lawns and shrubberies are very fine, some fine specimen English Yews are noticeable, being 30ft. high, and probably 30ft. through at foot, and are wonderfully well furnished to the ground. Two pillars of Golden Ivy on the lawn also looked well.

R. F. Mills, Esq., the owner of Tapton Grove, is an enthusiastic horticulturist, genial and pleasant. We were honoured by his presence, and were led to the conclusion that he takes a particular interest and pride in his grounds. He is a county councillor and member of the School Board, and is extremely popular in the district. Mr. W. R. Bloxham, the gardener, is secretary of the Chesterfield Chrysanthemum Society, and is enthusiastic in promoting the gardening charities, such as the Royal Gardeners' Orphan Fund, &c. He is a man of considerable experience, gained in such places as the Duke of Buckingham's at Stowe House; the Earl of Aylesford's, Packington Hall; thence to Moseley Hall, Birmingham, and he was three years at Shelton Hall, Newark, and seven years with the late Canon Sutton at Brant Broughton. He has been at Tapton Grove some fifteen years, and as he has practically had the modelling of the grounds here, he is naturally proud of the place. In local exhibitions, too, he has won a great reputation.—W. L.

## The Old-fashioned Garden.

A great part of the charm of the really old-fashioned garden lies in the fact that in it we find plants and shrubs and trees not to be found in the orthodox gardens of to-day. Except in the really old-fashioned garden, how seldom do we come across that quaint old shrub known in the old days as Bladder Nut. Philip Miller, in his "Gardeners' Kalendar," written during the first half of the eighteenth century, speaks of it as such, and never thinks of adding its more classical name of *Staphylea*. In this old-fashioned garden, however, it is, during the sunny May days, in full blossom. The pretty pendulous habit of the creamy white flowers has much of gracefulness. It is true the shrub is not significantly conspicuous, but in some half shady place it proves a charming subject, and might well be more generally grown. I may add that it is tall growing, and not by any means particular as to soil or aspect.

Another old-fashioned shrub that those who appreciate highly decorative effects might introduce to give brilliant display during many weeks is the double flowered *Kerria*. It flowers in favourable seasons during the latter portion of March, throughout April, and well into May, while not infrequently the end of the summer will again see it in blossom. It flourishes best in some sheltered nook, or with the protection of a wall behind it. In the latter case, however, it should never be trained flat upon it, but should be allowed to retain its bushy habit, as it is far more artistic thus grown. This shrub increases very freely, sending up new shoots every year, and therefore once established, is easily increased. There is also a single form that has much beauty to recommend it.

Yet another old-fashioned shrub that should find a place in every garden where these old-time shrubs and plants are appreciated and treasured is the Allspice Tree, or, as more properly I should name it, *Calycanthus*. This is also a May-flowering shrub,

*Cypripedium spectabile.*

and if the deep purple flowers have no great brilliancy to recommend them, they make, at any rate, curious and interesting subjects. By the way, it always seems to me that in our up-to-date English gardens we rarely have regard to the quaint and curious, yet our sense for these is as acute almost as our sense of the beautiful, and is quite as worthy of being catered for.

But to return to the Allspice Tree, or, if I must, the *Calycanthus*. I know it growing in an old garden border, fairly moist, but in the full sunshine, and every year it is literally covered with blossom. I give these details, as there seems to be some difference of opinion as to its tastes. An old authority tells us "they must have the warmest situation and the driest soil that can be procured," while another writer of much later date tells us "they flourish best when somewhat shaded by other trees, and where the ground is damp." Between these diametrically opposite conditions I think we may conclude that they are not particular, and will grow almost anywhere. Practical experience goes to teach that it is perfectly hardy. It is very compact and neat in growth, somewhat dwarf, that is to say, attaining 4ft to 5ft in height, and not too dense in habit.

I have one more old-fashioned subject to speak of to-day, so beautiful, so full of old-world charm, and yet, methinks, too seldom seen—I mean the pink or crimson May tree. There are double and single varieties equally worthy of cultivation. Indeed, I go so far as to say that no garden of any considerable size should be without one at least of these highly decorative subjects. The habit of the *Cratægus* generally is very characteristic and distinctive. The trees should be allowed ample room in which to develop. It is far too effective to be half hidden amongst a crowded belt or group of trees and shrubs; and if it can be done, it is seen to the best advantage when it can be viewed uninterruptedly from its topmost branch to the point where the angular and distinctive stem or stems meet the soil.

Few old-fashioned gardens but will be able to boast their Medlar tree. I always think this a highly picturesque tree. It is effective in early May, when covered with its large white blossom, and then in early autumn, again, it is valuable, as being one of the brightest tinted among the lower growing trees. The leaves take on a glowing tone that is most effective, while the fruit, when viewed at close quarters, is quaintly artistic and effective, both in habit of growth and in contrast to the foliage.—F. M. WELLS.

## Hand-list of Coniferæ.

The second edition of the list of Conifers grown in the Royal Botanic Gardens, Kew, has recently been issued, price 3d. The present hand-list enumerates 246 species and 451 varieties, or some 700 "sorts" in all. A brief review of the literature dealing with Coniferæ is published, extending to nineteen pages.

### Gardeners' Commissions.

I am not going into this matter very fully, mainly because I have little to add to what has been recently well said by your several correspondents. One thing I am certain of, viz., that employers of gardeners very much magnify the amount of commission they think their gardeners receive. Another is that if gardeners as a body would but brace themselves up more and act prudently they would be better off in the near future if the whole affair was abolished for ever—I mean both in pocket and self-respect. There are many phases of this commission business. It is not confined to gardeners and other servants. As all men who have any insight into the affairs of life know very well, it affects the class in some of its forms who employ gardeners: aye! and in much bigger lumps than gardeners are supposed to receive. Let us clear the bits of dirt from our own doorsteps, I say, and then work as citizens to compel the larger heaps to be swept off.

What caused me to pen these notes was the receipt of a bulb catalogue from a well known firm in Holland. I enclose you a leaflet inserted therein. This leaflet is not in the catalogue sent by some firms to employers. Assuming that the Bill now before Parliament for abolishing secret commissions is passed and becomes law, how will it reach foreign bulb merchants and nurserymen? This is an important matter nowadays, when garden owners are each year sending more of their bulb and other garden orders abroad. My own employer told me some time ago that the bulb requirements must come from Holland this year. I have no doubt if I wished I could cause them to come from the firm alluded to; and yet no English nurseryman of any repute would dream of making me such an offer. At any rate, after nearly forty years' experience as a head gardener I have never received such a one. The main remedy for the disease is for garden owners and employers of gardeners to pay them a just salary according to their character, responsibility, and average success in results. Then extract from them a promise to take no fee from any business man or firm; penalty, dismissal, and the cause of it to be put on any certificate of character given. I could name places where the butler and gamekeeper's presents from their employer's guests averaged £20 per annum, and yet the gardener, who does a good deal to contribute to these said guests' pleasure and enjoyment, did not average £3 per annum in presents or commission. As I said before, there are many phases of this business. It is no secret that there are employers of gamekeepers who pay them a very small wage on the tacit understanding that they will receive a liberal amount in presents from the employer's friends, and yet no one condemns this sort of thing.—YORKSHIRE GARDENER, July 1.

### Interesting Wild Plants.

It has always been a matter of the deepest interest to me to learn something about our wild plants. To many these humble subjects of our woods, waysides, and groves form a charm not to be even superseded by the more prepossessing exotics. Our young friends of botanical proclivities will be now keenly on the search for subjects, and a more pleasant pastime is difficult for me to determine. There is some reason for thinking this auxiliary to their profession is not so earnestly embraced by gardeners as it might be. Many of our young lads fail to see where the study of British flora has a bearing on other floras. However, a knowledge of their properties, habitats, and general characteristics, not to speak of higher technicalities, involving physiological or morphological science, is useful, and much is added to one's little word of happiness within himself.

The knowledge of the properties of plants must have given men an early subject for reflection; it does yet and probably will remain to do so for ages yet to come. The chemical combinations are so complex and in many cases so difficult to determine, that this form of chemical science may well be described as in its infancy. But apart from these considerations, it is extremely interesting to know as much as one can possibly acquire of the nature of a plant or plants. The poisonous and medicinal properties are ever fertile with interest. Almost every one of those have a history, some of them a tragic one indeed, and we never meet with the notorious Hemlock without the tragic story of Socrates arising. The meeting is both sacred and awe-inspiring, and the impressions which are necessarily precipitated tend to make us regard the Konian of the Greeks a subject of very doubtful friendship. Many are of the opinion that the Conium maculatum is not the Hemlock of the Greeks; but the Conium

is not the less powerfully poisonous. In some parts of the kingdom every typical plant of the same order is denominated Hemlock. The Water Hemlock (*Cicuta virosa*) is, perhaps, equally as powerful a poison as the Spotted Hemlock of notoriety, and so is also the Water Dropwort (*Oenanthe crocata*), whose outstanding poisonous effects are tetanic in character. The common garden annual, and specially characteristic umbel-bearing plant, the Fool's Parsley, possess poisonous properties of no mean order as well. Its specific name, *æthusa*, from *aitho*, to burn, would in some measure indicate such properties. Though a knowledge of British plants is not absolutely necessary in the formation of the curriculum of the gardener, it is nevertheless a most desirable addition, and may in some cases be a most serviceable one.—D. L.

### Back to the Land.

#### WHERE SMALL HOLDINGS PAY.

Expression of opinion is open to all, therefore I, as a disinterested yet interested person, may be allowed to make some remarks. I am not in any way connected with farming, although residing in a village that is supported by the land, and, moreover, live with a farm hand who is a living example of the type that "Briton" speaks about. Fully forty years on the farm, yet still earns a stipend of 15s. weekly. Intelligent enough, and cognisant with the various branches; but lacking that all-powerful item usually termed "go." And because of this missing quantity he will necessarily be compelled to work until he can do so no longer! Then what?

Personally I, like "Briton," am convinced that the small holdings are of more service, because a man who has managed to save a little money can take a few acres, be his own master, and be truly interested in his work, because it is to his benefit. There are several men about here who rent small holdings, not for tilling purposes, but cattle and sheep breeding, and their ever increasing stock is clearly an indication that a small place can be made to pay. But there are other ways of dealing with small holdings. To cultivate cereals on such is futile. The value of crops of such as Mangolds, &c., is insufficient. Therefore, growing for market is the opening that offers itself to men with a little capital and plenty of go. Fruit, certainly, is a worthy subject to take up, but the expense of planting two or three acres of land with trees is a considerable item. The fear of frost as referred to by "H. D." is also an item that cannot be overlooked, and two such seasons as the present and that of 1902 would certainly cripple any small man. But there are other details that are imported into this country which might well be grown at home. Something like 500,000 bushels of Onions were imported during the first five months of this year.

Is England unsuited to Onion culture? The private gardener can produce bulbs that for size would exterminate the imported Spanish. His ordinary specimens are fully equal to any that are brought over annually by those blue smocked, wooden clogged Bretons, who visit our towns and villages in all parts of the land. Therefore, why do not Englishmen take up Onion culture on an up-to-date scale? It should be up-to-date, however, not a mere surface-scratching-seed-sowing-without-cultivation affair. An expert on Onions in New York State deliberately states that 500 to 800 and even 1,000 bushels of bulbs may be secured from one acre of suitable soil. He himself has grown 800 bushels, each of which sold at one dollar, bringing in £166 English money! The total working expenses were \$295 (£59), to which were added cost of freightage and agents' fees—about 20 per cent.—this leaving a substantial profit on his working. Climatic and soil conditions are possibly more favourable than here, but I daresay that two-thirds of the above quantity could be grown on suitable soil! Celery also ought to be a paying crop. Referring to the States again, an expert says there is only one better paying crop than Onions, and that is Celery! It may interest readers to learn that much of the finest Celery in the States is grown by one firm, whose grounds are situated in California and Florida. This firm's products are despatched in refrigerator cars to all parts of the Union. When first started, the pioneer of this movement was quite a small man; now he is a millionaire. I am acquainted with one man who makes a speciality of about half an acre of Celery, and not the slightest trouble is experienced in disposing of it. His work is done entirely by hand, he and his sons doing it unaided, without ploughs and other quick agents.—A. W.

### Sorrows of Gardeners.

We all have heard or read of "The Sorrows of Satan," but if the sorrows of his satanic majesty are greater than those of the humble gardener then he has my sincere sympathy. I challenge anyone to enumerate a trade which possesses so many drawbacks as does gardening. It appears as if everything in creation and out of it were in league to spoil the efforts of the individual who practises horticulture. No sooner does he bring forth the spade and the fork than he lays the foundation of a

monument of trouble. The soil may work kindly and the seeds are sown, with the hope that they may bring forth fruit. But do they? No sooner is the work completed than the weather puts in a word. It may turn to wet, it may be drought; one way or the other usually brings a like result. The innocent man plants his early Potatoes and everything desirable follows until the shoots are 6in high, then along comes the frost fiend, and the gardener reaps his sorrow. He may plant late, if dry weather ensues the plants hang fire; if wet is the order, then all haulm is the result. Then comes hot weather as at the present moment, and the gardener knows what will follow. "My 'spuds' have the blight," says one. "My *Solanum tuberosum* have become infested with *Phytophthora infestans*," cries another. He prays for rain at one period, he denounces it at another.

I shudder to think of what was said by the Strawberry growers who were suffering through the lavish supply of aqua pura recently. The Peas are in early and all looked rosy, then comes the slug, the fiend that it is, and away go the Peas; likewise the Beans, to say nothing of other things. One gardener will plant out his early Cauliflowers, the slug pays a visit, another does ditto, the rabbit makes a call. The result in each case is the same. We gaze upon the great display of fruit blossom, even upon the young fruits, but Jack Frost chips in and they go. We look at our Currant and Gooseberry bushes, and watch the buds fattening. Then another visitor calls, this time the bird; in fact, many of them. Should the fruits succeed in getting through, the birds are there again. Pears, Strawberries, Currants, Gooseberries, Apples, and Plums are all grist to their mill. He looks rapturously upon his breaking Rose trees and sees visions of prizes. The maggot is at work ere the leaf is fully out. Then comes the aphid, and perhaps the mildew. Some things the poor gardener can cope with, but the Currant mite is beyond him. The "Mum" rust thrives despite the sulphide of potassium. The Carnations give joy as the buds swell visibly, but the wireworm says nay, and the poor biped animal tears his hair in desperation. He watches his "Cues" growing cheerily, when flop they go, and he knows what is the matter. The Melons get as big as eggs, then they take to rotting off. The Tomatoes look well one day, the next they are limp, and the gardener mutters "fungi." So one might ramble on for ever, but little value would accrue. All gardeners know, and have felt, the meaning of sorrow; therefore they will join with me in stating Nature sometimes to be against the gardener.—A.

## Begonias at Rocklands, Waterford, Ireland.

A few days ago I was afforded a great treat in being enabled to view the splendid collection of single and double Begonias at Rocklands, Waterford, the beautifully situated residence of John Newson White, Esq., J.P., who is a vice-president of the Waterford Horticultural Society and a most enthusiastic florist. I was very courteously shown through the houses and nicely arranged grounds by the head gardener, Mr. William Taylor, who is an adept at Begonia growing, and who has won many prizes for Begonia culture. The Begonia house is quite a new structure, erected for Mr. White by the celebrated firm of Messrs. Boulton and Paul, of Norwich. It is an ideal house for growing these charming flowers. Mr. Taylor showed me a lot of seedlings raised by himself: a single crimson one, the flowers being 8in in diameter; also a single crimson one with a white centre 7in in diameter; some beautifully fringed single seedlings; and a few magnificent seedling doubles, all being grown from seed saved by Mr. Taylor at Rocklands. I may say I have never seen a finer collection of seedlings.

Amongst the double named varieties I particularly noticed Mrs. Stothert, a beautifully grown yellow, Camellia-shaped flowers, the flowers being 5½in in diameter and 3in deep; Leviathan, dark rose, charmingly coloured, and of robust habit; Duke of Fife, a clear rose colour, beautifully crimped; Princess of Wales, very large erect flowers, beautiful blush pink colour; Henshaw Russell, flowers very large and full, beautiful scarlet; very erect form; Felix Marcotte, a dazzling velvety scarlet, flowers large and splendidly shaped, very compact; Mrs. French, free flowering, sulphur white, large full flowers, very vigorous; Rosebud, soft pink and very nicely shaped, one of the best pinks I have seen; Duchess of Fife, silver flesh colour, large flowers; Nurse Mary Cornell, very large, well formed flowers, beautiful salmon shaded pink; Lady Ashbrook, a strong grower, clear deep yellow, splendidly formed flowers, one of the best double yellows; Miss Edith Childs, immense flowers, Camellia-shaped, beautiful blush white; Madame La Baronne de Saint Didier, strong habit, immense full flowers, pale yellow. The best of the single varieties were Surprise, large flowers, deep velvety crimson; White Perfection, very erect flowers; Mrs. T. Lunt, an enormous light salmon; Prestige, enormous rich crimson flowers; Boule de Feu, large bright orange scarlet; Champion, large deep bronzy yellow.

Mr. Taylor has a magnificent house of single and double Zonal

Pelargoniums. Some of the plants measure 3ft in diameter and 9in from top of pot, grown in 8in pots. Some of the trusses are 8in across. He has a good show of Tomatoes, the variety being Winter Beauty; I saw some remarkably fine bunches of fruit.

Gloxinias are cultivated right well at Rocklands; I counted as many as sixty flowers on one plant, the plant measuring 2ft across. There is also a beautiful new conservatory attached to Mr. White's dwelling house. It is extremely gay at present with Cannas, Pelargoniums, Gloxinias, Orchids, Adiantums in variety. There is also a very fine house of Black Hamburgh Grapes well and carefully grown. The kitchen garden is well stocked, and in my humble opinion is a model of what a well kept garden ought to be. The whole concern reflects the greatest credit on the capabilities of Mr. Taylor, and I only wish some of the wealthy ladies and gentlemen around Co. Waterford would endeavour to try and emulate the example shown at Rocklands.—J. A. P.

## Fruit and Vegetables: Early Summer Crops.

There always attaches an interesting anxiety when one peruses the record of past and former years, and compares the maturity of the first fruits of the current season. That which affects 1903 will be interesting, though so intensely disappointing, because the reverses have been so many and frequent. It is, indeed, an interesting study, these comparative records extending over a series of years; and gardeners nowadays are afforded such excellent means of chronicling the returns of progress month by month in the presentation calendars given gratuitously by many of the leading seedsmen, that there ought to be no serious hindrance to anyone getting accurate information bearing on the question. On reference to diaries of some years now gone, I find 1893 contrasts most by its earliness of the summer crops. This, it need not be remarked, is entirely due to the weather in the early months of the year. Unfortunately of late the experience of cold winds, occasional or frequent frosts, varying in their severity, and absent sunshine all tend to make impressions on the memory which cannot so easily be obliterated—at any rate, from the gardener's mind.

This is not so true of the cook, or, indeed, often that of the mistress, for a week of sunny weather like that which followed the disastrous flood time of June, gives cause for inquiries after Peas and Strawberries, Cherries and Cauliflowers, just as though the maturity of crops were as spontaneous as is the alternate cloud and sunray. An instance bearing out this remark was made quite recently by an employer to his gardener. His written message was, "When are we to have Peas and other summer vegetables? I know the season has been bad, but here we are June 26 and all I see is the same old Potatoes and Cabbages." In this case, it seems, Asparagus did not count, and Turnips, Carrots, Spinach, and forced Beans were beneath notice. The yearning for home-grown garden Peas crushed these minor vegetables out of thought, and thus the gardener, anxious though he evidently was to gather the first Pea pod, had to learn how to digest hard words, and to wonder why the elements had dealt so hardly with him.

Comparing this season's crops with that of 1893, I find in our case there is from a fortnight to almost a month's difference in gathering the first. Peas then were ready May 30, this year June 26 furnished the first dish; yet though a similar variety and quite as early a start was made, the pods required a month longer to fill with the longed-for Peas. Exactly three weeks marked the difference in the Strawberry crops of the two years, and the same span divides the Raspberry. Currants are still (July 4) in a parti-coloured state; in 1893 they were full ripe by June 19, and Black Currants were ready on the same date. Dessert Cherries are late, and Morellos are in a similarly backward state. Much fruit, which until recently had given a favourable hope, now changes to a state which bespeaks failure. Black fly has been a source of much more than ordinary trouble; it pays its annual visit always, this year it behaved with persistent obstinacy.

Comparison has been made between the first and last years of a decade, 1893-1903, by stepping backward one season the unfavourable aspect of the present year, so far as it affects time, does not seem so striking. There is a gain of ten days in Raspberries in this over last year's record, and a corresponding march of time in Red and Black Currants. Strawberries, too, would show a material advance. It will be remembered that the spring of last year was extremely cold, winds coming from the north-east for so long a time, and frosts of a destructive nature being somewhat frequent in the month of June. Plums are so short that competition for time will be scarcely challenged, and Pears have had no chance at all. There are fewer actual fruits at the present time than there were bushels last year on the same ground. Employers and cooks will need many reminders of the spring frosts this summer, autumn, and winter; but all the debating in the world will not replace them, nor fill the fruit room shelves.—W. S.

## Flowers of the Season.

As each month comes round the garden may lose some of its fascinations, but, on the other hand, it receives fresh accessions of beauty. June seemed no less charming than May; and now July is as delightful as the months which have gone before. Nay, she is more charming in some ways, for the weather is more gracious both to our flowers and ourselves, and we are enchanted with all around. The breezes are soft and warm, and we can sit in the garden and list to the sounds they make among the trees and the plants, as they seem to sing the praises of the flowers among which they pass with their gentle breath, stealing meantime from the blossoms the fragrance they exhale. And we can sit and delight ourselves with the many flowers which around and about are the silent witnesses of the Great Power which calls them forth from Mother Earth to deck the world—even this little spot of ours we call a garden—with the forms of beauty we see beside us.

There are Roses many and of the most glorious beauty. It is true that the queen of flowers has smiled upon us with less urbanity than is her wont. The winds of spring were less benign with this sweetest flower than she deserved, and so she has been unable to yield to the full her greatest bounty. Yet we expect that when autumn comes she will more than compensate for our present loss; and it must be said that had we not known the profuse gifts the Rose can give us in favoured years we had not felt any disappointment at all, for truly there are Roses in plenty with us now. Hybrid Teas and Teas are less plentiful, but others have been impressive in their loveliness. It is for the rosarian, however, and not for me to tell fully as ought to be told the impressive beauty of the Rose in all her forms. She is the *summum bonum*; the perfection of perfections; the gift of gifts to the lover of flowers.

The regal Lily, too, has entered upon that annual conflict of which the poets have told. One should hardly call it a conflict; for rather is the Lily the companion than the challenger of the Rose for pride of place. One may adopt the imagery of Percival, who turns the languages of flowers into verse, and says:

The Rose is a sign of joy and love,  
Young blushing love in its earlier dawn.

And of its companion the Lily:

Innocence shines in the Lily's bell,  
Pure as the heart in its native heaven.

If we look upon them thus we shall acknowledge that, as the Rose symbolises joy and love, the Lily the symbol of innocence, is therefore an inseparable associate of our queen of flowers. She has come to us in other forms at first, but it is in *Lilium candidum*, the Madonna Lily, that we have at this season the embodiment of the graces and beauties of this flower.

Then we have the Iris with us as well. The Flag Irises of the *barbata* section have been somewhat churlish in their gifts of flower this season, but there are yet others which have been more liberal. Perhaps of them all, the English Irises have been finer than usual, and as the month of July begins we are delighting in these shapes and colours of loveliest beauty. Had we never had the Rose and the Lily, the Iris would have stood high in the lists had we to choose among our hardy flowers for a royal plant. Whether or no it was the ancient fleur de lis under whose banner was enrolled so much of the chivalry of past days, it is a noble flower and impressive in its charms and graces.

We must also rejoice in the Campanulas. Some are well named, for they are graceful Campaniles, supporting noble bell-like flowers on which we might fancy the fairies and sprites sounding the chimes to welcome in the opening day. In them by day the bees sound forth their booming notes as they seek for nectar in these shapely flowers of blue, of purple, or of white. Such are the noble *Campanula persicifolia grandiflora*, the chaste *C. persicifolia alba grandiflora*, the salver-like flowers of *Campanula grandis*, or the fine purple or white bells of *C. latifolia macrantha* and *C. latifolia macrantha alba*. Then there are the dwarf members of the race, such as *C. pumila* or the fine purple-blue blossomed *C. Portenschlagiana grandiflora*, as we ought to call the "Bavarian" form, delightful just now hanging from a rough wall or veiling the stone steps of the ascent to a small roof garden.

There are also stately spires of the noble Delphiniums, with the lighter but equally beautiful spikes of some of the species untouched by the modifying hand of the hybridist. It is needless to name these hybrid Delphiniums, for are not their names familiar to the readers of our Journal who read the accounts of the Kelwayian and French perennial Larkspurs? Then there are the sulphur yellow of *D. zahl*, the orange-red of *D. nudicaule*, and the various colours and shades given by others more or less distinct.

In the Cistuses and Helianthemums we have true children of the sun; more correctly, one might say, perhaps, "children of the morning sun," for most of them open with the early hours, and have lost their beauty ere king Sol has sunk far past his meridian. Here is a noble bush of *Cistus laurifolius*, more than 6ft high, and at present spangled with fine white flowers. In a

day or two it will be well nigh covered with them. Here, again, is *C. albidus*, and there *C. salviæfolius*, both pictures of loveliness; while the dwarfer *Helianthemums*, or Sun Roses, have not yet donned for the year the sober grey garments in which they seek obscurity when their time of beauty has gone by.

Then with fragrance unspeakable is not the garden dowered by the Carnation and the Pink? The Carnation is dearer to the heart of the specialist in these flowers than to many, but all must acknowledge its loveliness and its sweetness. And the Pink in its many forms has devotees many; from him who spends his time and lavishes his affections upon the laced ones or the chaste white and coloured border varieties, to him who studies with earnestness and devoted admiration the numerous species dear to the heart of the hardy plantsman or the "alpinist." All these forms are here, and all are lovely; though, it must be said, even if with bated breath, that all are not fragrant with that sweet odour which is the special gift of so many of these Pinks.

And as we look around at other flowers the eye wanders with pleasure from plant to plant, scanning their beauty or lingering upon some of more than ordinary charms or interest. Here is a group of the hybrid *Mimulus Burnetii*; there, by the Water Lily pool, a patch of *M. luteus* and one of *M. cupreus Brilliant*. The *Nymphæas* themselves have come into loveliness, and open their charms to the admiration of the brilliant sunshine. Beside them are some of the *Spiræas*, or Meadow-sweets, giving their masses of plume-like flowers in profusion. Delightful are they, whether flourishing well in a dry one, as is the manner of the bright little crimson-flowered shrubby *S. bullata*, now coming into bloom, or in a moist one, as is the way of *S. palmata* or the noble *S. aruncus*. We gaze upon bright hardy *Geraniums* and *Erodiums*; upon *Alströmérias*, or on the spiny-looking but lovely *Eryngiums*. In the borders and about the rockeries are many *Violas* of all colours we find among the race, while Poppies flaunt their great blooms among the other flowers. *Valerians* give their unimposing racemes of blue or white, and *Veronics* are masses of blue, either in carpet on the rockeries or in upright clumps in the border. The earliest annuals have begun, and help the effect of the many other flowers. Over all is the sun, flooding the garden with brightness and light. Each plant is a study of light and shade, each flower a vision of loveliness. Truly Summer brings with her bounties for all of us; and none have more cause to bless her than those who love their gardens and cherish their flowers.—

S. ARNOTT.

## Cryptomeria elegans.

Amongst the many beautiful Conifers from Japan this is, without doubt, one of the most ornamental, easy of propagation by cuttings, cultivation, and hardy. It is not particular as to soil and situation, bearing also with impunity sharp frosts, boisterous winds, and heavy rains; in fact, it revels in plenty of moisture, but to bring out its bright and rich colouration, the best conditions are a light porous sub-soil, and an airy, sunny situation, with plenty of room for development. In the earlier stages of growth a certain manipulation of its branches should be practised to ensure an upright and symmetrical habit of growth, as it has a strong tendency to produce a multiplicity of leaders and straggling lateral branches, giving the plant an irregular and unsymmetrical contour. To form the main stem, the central leaders should alone be preserved, and the duplicate ones, with all straggling laterals, well pinched back; whilst all branches up to, say, 6in or 8in. at the base of the main stem, also any suckers should be cut away entirely. This *Cryptomeria* was discovered in 1863 by the late Mr. John Gould Veitch. There is a large proportion of the species belonging to the different genera of the Conifers distinguished for their alternation of foliage colouring, but none more so nor more striking than the subject in question, which assumes in the late autumn and winter season a rich bronzy red colour on the exterior stems and foliage exposed to full sunlight, whilst the shaded portion retains the ordinary green colour, thus rendering the plant, whether growing singly or several in a group, a most conspicuous and ornamental object; not surpassed by any other evergreen tree or shrub. Planting them *en masse*, however, is hardly to be recommended, as if planted too closely together the contour of the plant is destroyed.

One of the finest specimens known in England (according to Veitch's "Manual of Coniferae") was at Linton Park, near Maidstone, in 1881, being 20ft. in height, and, according to the excellent illustration, it must have presented a fine and remarkable appearance. The author says that *C. elegans* was first discovered by the late Mr. John Gould Veitch, who met with it only in cultivation in the neighbourhood of Yokohama, but he had never known of its growing in a wild state. There is said to be a form of it called *C. elegans nana*—a low, dense, bushy shrub, with leaves more crowded than the preceding, which retains all the intensity of the glowing crimson hue of *C. elegans* during the winter months, with the exception of the pendulous tops of the branchlets, which continue green. The resemblance of *C. elegans* during the growing season to *Araucaria Cunninghamii* is very apparent.—W. G.

## NOTES

## NOTICES

**Cambridge Botanic Garden Report.**

The Botanic Garden Syndicate (Cambridge) send us a copy of the annual report to the Senate, which shows progress, and a successful year's work.

**Eucalyptus in Flower.**

At Courlands, Lostwithiel, Devon, are two Eucalyptus trees now in full bloom, this being the sixth year they have flowered. One of these trees is considered the largest in Cornwall, and one of the largest of its kind in England.

**Huge Fruit Arrivals.**

During the present season about one and a half million cases of Oranges were shipped to London and Liverpool, chiefly from Valencia and Murcia. This is the largest output known to the trade. Those that are obtainable are making from 20s. to 30s. a case of 420 fruits. These are phenomenal values. The shipments of Apples from Tasmania and Australia have been considerably larger than ever.

**The Midland Carnation and Picotee Society's Show.**

We had a committee meeting of the above society on July 2 to fix the date of the forthcoming exhibition, and owing to the lateness of the season it was decided to hold the exhibition as usual at the Edgbaston Botanical Gardens, Birmingham, on Thursday and Friday, August 6 and 7. If you would kindly mention this in your next issue we should feel very much obliged.—HERBERT SMITH, 87, Drayton Road, King's Heath, Birmingham.

**June Weather at Belvoir Castle.**

The prevailing direction of the wind was north, total ten days. The total rainfall was 2.08in, this fell on nine days, and is 0.04in below the average for the month; the greatest daily fall was 0.63in on the 14th. Barometer (corrected and reduced): highest reading, 30.457in on the 4th at 9 a.m.; lowest reading, 29.630in on the 15th at 9 p.m. Thermometers: Highest in the shade, 81deg on the 27th; lowest, 34deg on the 4th; mean of daily maxima, 62.86deg; mean of daily minima, 45.83deg; mean temperature of the month, 54.34deg; lowest on the grass, 30deg on the 4th; highest in the sun, 129deg on 26th, 27th, and 28th; mean temperature of the earth at 3ft, 53.43deg. Total sunshine, 167 hours 30min, which is 13 hours 50min below the average for the month; there were four sunless days. The mean temperatures are all much below the average for the month.—W. H. DIVERS.

**Ipswich Gardeners' Outing.**

The annual outing of this society took place in glorious weather on Saturday, the 27th, when some seventy or eighty members of the craft visited Ackworth Park, East Bergholt, the residence of A. Harwood, Esq. The house is situated on high ground overlooking the valley of the Stour, which is noted for its beautiful scenery, always associated with the name of Constable, the great landscape artist. A broad expanse of lawn reaches up to the house and gradually slopes away down to the Rose garden, furnished with lovely arches of climbing Roses, and beds of all the best H.P.'s, H.T.'s, and Teas. Beyond the rosery a well-stocked herbaceous border forms an item of interest to lovers of this class of plants. The conservatory attached to the mansion was bright with Gloxinias, Begonias, Streptocarpus, Streptosolen Jamesoni, &c., all arranged with excellent taste. A new range of houses in the kitchen garden contained a vinery in which excellent examples of Black Hamburgh and Foster's Seedling Grapes had nearly finished colouring; a small house with Peach trees in pots bearing good crops, a stove, and a greenhouse, the latter containing a promising lot of Begonias. In the kitchen garden cleanliness and good culture were much in evidence; Strawberries were a good crop, other fruit crops very short, the general rule throughout Suffolk this season. The head gardener, Mr. Hicks, deserves great credit for the excellent order in which the various departments of the establishment are kept.—E. C.

**Gardening Appointment.**

Mr. F. Jackson, as head gardener to J. Spencer Phillips, Esq., of The Mount, Shrewsbury.

**The 1903 Sweet Pea Show.**

Evicted from the site of their former yearly displays, the National Sweet Pea Society will hold their third grand exhibition at London's popular resort, Earl's Court, on the 15th and 16th inst. On both days the spacious Prince's Hall at the Warwick Road entrance, picturesquely arrayed with varieties of the Sweet Pea from all parts of the kingdom, will be open entirely free to visitors to the International Fire Exhibition. In addition to the numerous prizes offered in the recognised classes, the National Sweet Pea Society' silver medal will be given for the finest novelty of the year.

**Failure of Fruit Crops.**

The failure of the fruit crops in the Driffield (Yorks) district is general, excepting some of the "soft" fruits, such as Strawberries and Gooseberries. The former give promise of a considerable yield; they have developed slowly because of a lack of sunshine and the necessary warmth, which has now been imparted to the soil, and the crop is growing splendidly. Of Gooseberries the supply will be shorter than usual, and the price is keeping high, the berries being sold at 2½d. and 3d. per pound retail. Black and Red Currants and Raspberries have done badly; but worst of all are the standard fruit trees, which are almost a dead failure. Such a state of things has not been experienced for thirty years. Trees which bore thirty stones of Apples last season, and had never been known to fail, are this year without fruit, notwithstanding the early promise of a more than average yield, the trees, as a rule, being full of lovely blossom. The same observation is applicable to Damsons, Plums, Pears, and Cherries.

**Temple House Gardens, Great Marlow, Bucks.**

The rainfall here for June, 1903, was 6.59in. Rain fell on ten days during the month. The heaviest fall in twenty-four hours was 1.73in, which beats my record. The floods did much damage here, a portion of the park and gardens having been entirely under water, and men worked day and night pumping water out of the stokcholes. Most of the allotment produce has been severely damaged, and the Potato crop ruined. Several Conifers and deciduous trees that were planted on boggy soil are entirely uprooted, and lying on the ground. The maximum temperature for June, 1903, was 74deg on the 26th, and the minimum 38deg on the 21st. The maximum for 1902 was 79deg on the 29th and 30th, and minimum 36deg on the 9th. The rainfall for June, 1902, was 3.42in.—G. G.

**Strawberry Cultivation.**

The bed of specially prepared Strawberry plants in the Western Gardens, shown by Mr. J. F. Williamson, of Summer Hill, Mallow, Ireland, who makes a speciality of them, is now in grand condition, and should be seen by visitors to the Cork Exhibition. The varieties shown are Royal Sovereign, Leader, Laxton's Fillbasket (an extraordinary cropper), Trafalgar, Latest of All, and Louis Gauthier. His plants are grown from the earliest runners, and undergo special cultivation whereby the crowns become fully matured and ripened, and the roots grow out naturally from the very beginning. The value of Strawberry plants should be judged by the robustness and plumpness of their crowns rather than by the luxuriant but unmatured leaf growth, which so frequently results in barrenness the following season. As a rule, yearling plants thus raised can be relied upon to give as large a crop as ordinary runners do when they are two or even three years old. Latest of All is proved here to be the most prolific variety in cultivation, a single plant having produced the extraordinary crop of eighty-one berries, weighing 21oz, as a yearling, and 132 berries, weighing 29oz, the following season. The variety Louis Gauthier, though not of such an attractive appearance, being an albino, as some of the other varieties, attains a very large size, and the flavour is exceptionally fine. This variety is specially recommended, as it bears very heavy crops, and if given plenty of room, and the spring bloom be removed, it throws out a quantity of runners, and if these be pegged into the ground the probability is that many of them, together with the parent plant, will bear a fair crop late in the autumn.

## Societies.

### Royal Horticultural Society, July 7th.

The Drill Hall was much more bare than usual, not only of exhibits, but visitors also; doubtless the visit of the French President had much to do with this. Orchids were sparsely represented, while in the fruit division the Pines and Strawberries were the chief feature. It was left to the floral section to produce the display.

#### Orchid Committee.

Present: H. J. Little, Esq. (in the chair); with Jas. O'Brien, de B. Crawshaw, H. T. Pitt, W. Boxall, M. Gleeson, W. H. Young, E. Hill, H. A. Tracy, W. H. White, and H. A. Biluey.

Mr. W. H. Young, grower to Sir F. Wigan, Clare Lawn, East Sheen, contributed half a dozen Orchids, consisting of *Sobralia Wiganiae*, *S. Veitchii aurea*, *S. macrantha*, *S. sanguinea*, and *S. xantholeuca*; also *Cypripedium Godefroyae leucochilum*.

Messrs. W. Bull and Sons, King's Road, Chelsea, exhibited a small collection of *Anætochili*, which were well grown, and included *A. regalis*, *Hæmaria Dawsoniana*, *Macodes petala*, and *Dossinia marmorata*.

#### Floral Committee.

Present: H. B. May, Esq. (in the chair); and Messrs. C. T. Druery, Geo. Nicholson, John Green, J. F. McLeod, Jas. Hudson, J. Jennings, W. Howe, G. Reuthe, Chas. Dixon, H. J. Cutbush, Geo. Gordon, H. J. Jones, R. W. Wallace, Chas. E. Pearson, C. E. Shea, W. P. Thompson, E. H. Jenkins, and Amos Perry.

Messrs. Jas. Veitch and Sons, Limited, Chelsea, made a nice display of Sweet Peas grown in pots and trained in barrel form. The plants were nicely flowered, the best being Sadie Burpee, Mars, Black Knight, Gorgeous, Lady Grisel Hamilton, Katherine Tracy, Miss Willmott, and Navy Blue. A fine collection of *Campanula peregrina* in pots also called for attention; the plant appears to possess considerable merit as a decorative subject. The same firm also exhibited baskets of the following flowering shrubs:—*Cytisus schipkaensis*, *Cytisus nigricans*, splendidly flowered, *Stuartia pseudo-Camellia*, *Escallonia langleyensis*, a bright rosy red, and *E. Phillipiana*, a free flowering white form. A box of the well-known *Rhododendron* hybrids was staged in sixteen varieties. A fine group of *Cannas* and *Carnations*; the former were well flowered, while the latter consisted of the Tree and Malmaison types, the chief being Wm. Robinson, Lady Rose, Robert Burns, Lord Rosebery, Mrs. Trelawny, King Oscar, Princess of Wales, John Coles, Thora, and Albion. Mr. R. Anker, Addison Nursery, Kensington, contributed a display of Cacti, many of them showing flowers.

Messrs. Barr and Sons, Covent Garden, made a pretty display of early flowering Gladioli, Irises of the Japanese type, with a few water Grasses. The most prominent Gladioli were Favourite, Colvillei roseus, Peach Blossom, Mathilde, and Mackintosh.

From Messrs. J. Cheal and Sons, Crawley, came a nice exhibit of cut Sweet Peas; the blooms were clean and bright, and embraced fifty-eight varieties, the most prominent being Captivation, Prince of Wales, Stanley, Blanche Burpee, Blanche Ferry, Aurora, Miss Willmott, Grey Friar, Alice Eckford, and Mrs. Joseph Chamberlain.

A nice exhibit of cut Carnations came from Messrs. W. Cutbush and Son, Highgate; the blooms were large and in first-rate condition, the chief being Cecilia, Claverhouse, Mrs. Trelawny, Grace, Wyvern, Shiela (grand), Sabrina, Don Juan, Admiral, Nautilus, Monk, and Maggie Hodgson.

The Rev. W. Wilks arranged three vases of Shirley Poppies to show gradual increase of yellow, pink, and salmon shades in the colouring. Needless to say, the exhibit clearly demonstrated the great strides that are being made in this strain.

Hardy flowers were splendidly staged by Mr. M. Prichard, who had a large exhibit rich in uncommon and rare plants; some of the most noteworthy were *Spartium junceum*, *Campanula Burghaltii*, *Achillea eupatorium*, *Clematis integrifolia*, *Spiraea venusta*, *Delphiniums* in variety, *Astilbe Silver Sheath*, and a few nice *Nymphæas*. A nice collection of Japanese Irises completed the display.

Messrs. T. S. Ware, Limited, Feltham, occupied a table running the entire length of the hall, the exhibit being noteworthy for the collection of *Delphiniums*; in these were noted Miss Gladys Batchelor, Mrs. Clifton Robinson, White Pearl, Nora Hollies, Neptune, Shelley, Copernicus, and Cerberus. In the herbaceous plants were noted *Lilium Hansonii*, *L. japonicum*, *Alströméria chilensis*, *Spiraea Aruncus*, *Verbascum phlomoides*, *Geranium pratense flore-pleno*, and *Lilium maritimum*; while two spikes of *Eremuri* attracted a lot of attention—*E. Wycliffe*, a canary yellow, and *E. Sybil*, an orange form.

From Mr. H. B. May, Dyson's Lane Nursery, Upper Edmon-ton, came a grand display of Crotons, ranging from nice specimens to decorative plants in 5in pots; the plants were remarkable for their rich colouring. They were beautifully arranged with Palms and Ferns. A few of the best were C. Prince of Wales, Elysian, Lord Wolseley, B. Comte, Andreanus, Emperor

Alexander III., Sunrise, Comte de Germiny, Thomsoni, Reidi, and Grandis.

Messrs. J. Peed and Son, West Norwood, made a nice semi-circular group of Carnations in pots edged with variegated Grasses. The chief varieties represented were Cecilia, Princess of Wales, Mrs. Trelawny, Lily Measures, Nell Gwynne, Maggie Hodgson, and The Marchioness.

Mr. E. Potten, Camden Nurseries, Cranbrook, displayed hardy flowers and a pretty new Polyantha Rose named Schneewittchen, which appears to be a good variety; in colour creamy white, with a little buff in the centre. Irises Monieri and *I. orientalis gigantea*, *Delphinium Arago*, *Gaillardia grandiflora*, *Potentillas* in variety, and *Inula glandulosa* formed the chief features.

Mr. J. Douglas, Great Bookham, arranged a few nice vases of Carnations comprising many varieties.

Miss Willmott, Warley Place, contributed two baskets of *Verbena Warley*, a deep crimson, very floriferous, and exhibited in good form; also three well flowered plants of a new *Lilium*.

Mr. Amos Perry, Winchmore Hill, again displayed a collection of hardy flowers, with a choice collection of *Nymphæas*. Chief of the hardy flowers were *Ostrowskia magnifica*, *Delphiniums* in variety, *Iris juncea*, *Campanulas*, *Calochorti*, and *Liliums* in variety. The *Nymphæas* included examples of *N. Robinsoni*, *N. M. albida*, *N. lucida*, *N. Gloriosa*, *N. aurora*, *N. Laydekeri purpurata*, *N. M. carnea*, *N. Wm. Dooze* (a grand white), *N. Gladstoniana*, *N. M. chromatella*, and *N. Ellisiana*.

Roses were represented by Messrs. B. R. Cant and Sons, Colchester, who made a beautiful display of Teas arranged in vases. The chief varieties were Madame Jean Dupuy, Mrs. B. R. Cant, Duchess of Portland, Liberty, Madame A. Chatenay, Frau Karl Druschki (in grand form), Papa Lambert, Mildred Grant, Madame Ravery, Mrs. E. Mawley (of grand colour), Lady Roberts, Killarney, Georges Schwartz, Morning Glow, and Lady Moyra Beaulere.

#### Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); with Messrs. J. Cheal, W. Bates, S. Mortimer, A. Dean, T. Coomber, C. G. A. Nix, Jas. Smith, F. Q. Lane, G. Wythes, Jas. H. Veitch, A. H. Pearson, H. Balderson, and H. Esling.

Messrs. H. Low and Co., Bush Hill Park, sent a well fruited tree of White Marseilles Fig, and a good pair of pot Vines, both, however, quite unripe.

Mr. Thos. Coomber, gardener to Lord Llangattock, The Hendre, Monmouth, staged eighteen Queen Pines in grand condition, the fruits being large and splendidly developed. The same exhibitor also staged a dish of Peaches named Raymaekers, large and splendidly coloured.

From Messrs. G. Bunyard and Co., Maidstone, came a collection of twelve varieties of Strawberries, arranged in Leedham's patent baskets. The varieties were President, Royal Sovereign (grand), Trollope's Victoria (which travelled badly), Sir Joseph Paxton, Louis Gauthier (as bilious looking as ever), Waterloo, Leader, Monarch, Goliath, Trafalgar, Walluff (fine size), and Dr. Hogg.

Messrs. Veitch and Son, Exeter, sent a fine dish of Western Express Pea, also plants of the same variety; the pods were large and well filled. Messrs. W. Cutbush and Son, Highgate, sent a Melon Incomparable. From the Horticultural College, Swanley, came four well grown Melons, and a nice dish of Lady Sudeley Apples, the latter being of good size and well coloured. Mr. Geo. Fowler, 78, Bank Street, Maidstone, exhibited bottling appliances, also samples of bottled fruit.

#### Medal Awards.

ORCHID COMMITTEE.—Silver Banksians for groups of Orchids to Messrs. W. Bull and Sons, Chelsea, and Sir F. Wigan.

FRUIT COMMITTEE.—Silver-gilt Knightian to Lord Llangattock, Hendre Gardens, Monmouth, for eighteen Pineapples, the Queen.

FLORAL COMMITTEE.—Silver-gilt Flora for group of Malmaison Carnations, &c., to Messrs. J. Veitch and Sons; for Carnations to Mr. H. B. May, Upper Edmon-ton. Silver Flora for hardy flowers to Messrs. R. Wallace and Co., Colchester. Silver Banksian for hardy flowers to Mr. M. Prichard, Hants; for cut flowers to Messrs. T. S. Ware, Limited, Feltham; for *Verbena Warley* to Miss Willmott, V.M.H., Warley; for Carnations to Messrs. J. Peed and Son, West Norwood; for hardy plants to Mr. A. Perry, Winchmore Hill.

#### Certificates and Awards of Merit.

*Campanula Peregrina* (Veitch and Sons).—A plant of fine decorative habit, growing about 2½ft. Flowers light blue, deepening towards the edges of the petals, with a distinct purple disc. A.M.

*Carnation Diadem* (Messrs. Cutbush and Son).—A yellow ground, heavily edged with rose; calyx good. A.M.

*Carnation Merlin* (Cutbush and Son).—Fine yellow ground, heavily marked with crimson and chocolate; large, and a capital calyx. A.M.

*Melon, President Loubet* (J. Snell).—A nicely netted scarlet-fleshed variety of medium size and fair flavour. A.M.

*Nephrolepis cordifolia crispata congesta* (H. B. May).—A variety of more interest to the botanist than to the horticultural fraternity. A.M.

**Lilium Martagon and its white variety.**

The Martagons form a sub-genus of *Lilium*, and are mostly distinguishable by their turn-cap, or Turk's-cap shape, *L. canadense* being a marked exception. We figure the typical purple *L. Martagon* and its rare and chaste beautiful albino form. *L. chalcedonicum* is a common and popular representative of the group. Martagons, in general, make no stem roots, hence they should not be planted deeply, but the soil should be deep, for they root straight down. A loamy tilth, and a cool, damp place suits them admirably.

## Hanley Horticultural Fête, July 1st and 2nd.

This was the seventh annual flower show in Hanley Park, and Mr. Joseph Kent, the energetic secretary, whose efforts have contributed so much to its success, is to be congratulated on the remarkable success which attended it. Judges who had been present at all the series said it was the best all-round exhibition yet held. The group tent, in which seven were arranged, was a show in itself; but one could not but regret that all the seven were arranged pretty much upon the same lines, the ground plan being similar in all. This is now becoming a stereotyped method at all our large provincial exhibitions, and it may soon become necessary to offer special premiums for some new and novel designs, or visitors will tire of the monotony of arrangement. There were huge specimen plants, foliage and flowering, Orchids and Carnations, good fruit and vegetables for the season, charming floral decorations, and many fine features in the way of miscellaneous exhibits, with a wonderful exhibition of plants, flowers, &c., by children, while the Rose tent surpassed all expectations in the extent and quality of the flowers staged. There was an interesting opening ceremonial on the first day by the Countess Torby; but, while the first day was gloriously fine, a rough wind and a heavy storm on the second day made things unpleasant, but there is reason to think the financial result will be satisfactory.

### Plants.

**PLANTS.**—In the group class, each covering a space of 300ft, valuable prizes were offered, but there could have been no doubt in the minds of the judges as to the appropriateness of awarding the first prize to Messrs. Cypher, Queen's Nursery, Cheltenham. Here stately Palms and fine-leaved foliage plants were in combination with stately Orchids, brilliant Crotons, &c.; every detail was perfect. Mr. W. Vause, Leamington, came second with an arrangement which fully justified this award; Mr. J. Read, The Gardens, Bretby Park, was third; and Messrs. Artindale and Son, Sheffield, fourth. The best group of Orchids came from Mr. J. Robson, nurseryman, Altrincham: the plants were set up in a tasteful manner, and included *Cattleya Mossiae* in variety, *C. gigas*, *Dendrobium formosum giganteum*, *Brassavola Digbyana*, *Odontoglossums*, *Cypripediums*, *Masdevallias*, &c. Messrs. Cypher were a good second, chief among their contribution was *Dendrobium Dalhousianum*, *D. moschata*, *Anguloa Ruckeri*, *Cypripediums*, *Odontoglossums*, *Lælia tenebrosa*, &c. Mr. W. Vause was third.

Carnations of the Malmaison type in groups made fine patches of colour. Mr. J. Robson was again first, having mostly plants of Princess of Wales finely bloomed; H. J. Jones, crimson, with here and there patches of scarlet, maroon, and yellow. Mr. P. Blair, The Gardens, Trentham, was second with larger plants, but less quality of bloom.

With six specimen plants in flower Messrs. Cypher were first, having a *Bougainvillea Sanderiana*, *Ixora salicifolia*, a well flowered *Francisea eximea*, a large *Statice*, and two others. Mr. W. Vause was second, having two *Bougainvilleas*, viz., *Sanderiana* and *glabra*, *Clerodendron Balfourianum*, &c. With six flowering and six foliage they had mighty Palms and brilliant Crotons, *Statice intermedia* and *profusa*; two good *Ericas*, *Clerodendron Balfourianum*, *Stephanotis floribunda*, &c. Second, Mr. W. Vause, Leamington.

In the class for eight Orchids, Messrs. Cypher were first with good examples of *Thunia Winniana*, *Cypripedium Curtisi*, *Lælia tenebrosa*, *Epidendrum vitellinum majus*, *Cattleya gigas*, *Lælia falfacata*, &c. Mr. G. Robson was placed second: chief among his were *Odontoglossum crispum*, *Cattleya Mendeli*, *C. gigas*, *Cypripediums*, &c. With six Palms Messrs. Cypher were again first, having *Kentias*, *Latania borbonica*, &c., Mr. Vause coming second, and the same positions were occupied in the class for six fine-foliage plants. Good medium sized *Caladiums* were shown by several exhibitors, and also pretty table plants.

**ROSES.**—The Rose tent proved one of the chief attractions at the show. In the class for seventy-two varieties Messrs. Harkness and Co., Hitchin, Herts. were first, and though the blooms were not full sized and lacking in colour in the case of the H.P.'s, they were much more refined than was anticipated. The chief varieties were *Caroline Testout*, *Boadicea*, *Niphetos*, *Souvenir d'Elise Vardon*, *Bessie Brown*, *Mildred Grant*, *Souv. de S. A. Prince*, *Le Havre* (one of the most brilliant of the H.P.'s), *Jean Ducher*, *Caroline Kuster*, *François Michelin*, *Clara Upton*, *Marchioness of Downshire*, *Mrs. J. Laing*, *The Bride*, *Helen Keller*, *Madame G. Luizet*, &c. Mr. Geo. Mount, Canterbury, came second, also with good flowers, but the short time at our disposal for note-taking prevented the gathering up of particulars. Messrs. G. and W. Burch, Peterborough, were third, and Messrs. Townsend and Son, Worcester, fourth. Some six stands were staged. There was the same number of forty-eight varieties, and here the King's Acre Nursery Company, Hereford, were placed first with good blooms for the season, chief among them *Marchioness of Downshire*, *Kaiserin Augusta Victoria*, *Caroline Testout*, *Exquisite*, *Charles Lefebvre*, *Robert Scott*, *Tom Wood*, *Madame Abel Chatenay*, *Lady M. Fitzwilliam*, *Bessie Brown*, &c. Messrs. Burch were second, Mr. G. Mount third,

and Messrs. Harkness and Co. fourth. With thirty-six varieties, three blooms of each, Messrs. Harkness and Co. were again first; they had some very good trebles, such as *Souv. de S. A. Prince*, *Helen Keller*, *Mrs. J. Laing*, *Fisher Holmes*, *Frau Karl Druschki*, *Souv. de President Carnot*, *Duchesse de Vallombrosa*, *Bessie Brown*, *Lady M. Fitzwilliam*, *Caroline Testout*, &c. Messrs. Burch were second, Mr. G. Mount third. The class for twelve new Roses brought no entry. In the class for twelve distinct varieties Messrs. Jarman and Co., nurserymen, Chard, were first with fine blooms of *Mildred Grant*, *Bessie Brown*, *Rosamond de Hugres*, *Frau Karl Druschki*, *Margaret Boudet*, *Marquise Litta*, &c. Second, Messrs. Townsend and Son; third, Mr. W. H. Frettingham, Beeston. The only stand of twelve Teas in trebles came from Messrs. Townsend and Son; they were good, and comprised *Madame Willermoz*, *Bridesmaid*, *Marie Van Houtte*, *Anna Olivier*, *Souv. de S. A. Prince*, &c. The best twelve blooms of one variety brought several stands, the first prize going to the King's Acre Nursery Company for *Lady Mary Fitzwilliam*; Messrs. Townsend and Son came second with *Bessie Brown*; and Mr. G. Mount was third with *Mrs. Sharman Crawford*. Garden Roses in eighteen and nine bunches brought creditable displays; Messrs. Townsend and Son were first, the King's Acre Company second, and Messrs. Harkness and Son third; but no names were attached to the varieties in the two first collections.

### Cut Flowers and Decorations.

**CUT FLOWERS.**—Collections of hardy perennials, filling a space of 64ft, made a splendid display. Messrs. Harkness and Son, Bedale, were first with very fine bunches of highly developed subjects—*Lilies*, *Delphiniums*, *Iris*, *Pyrethrums*, &c., showing what a wealth of hardy flowers can beautify our borders in summer. Messrs. Gibson and Co., Bedale, were a good second, and Mr. J. H. White, nurseryman, Worcester, third. There was but one collection of hardy flowers from which nurserymen were excluded. The first prize was given to a representative collection from Mr. J. C. Waterhouse, Macclesfield, which included such things as *Poppies*, *Delphiniums*, *Campanulas*, *Canterbury Bells*, *Phloxes*, *Iris*, &c.

**FLORAL DECORATIONS.**—The best arrangement of flowers in a basket came from Messrs. Perkins and Sons, Coventry, who had a very rich combination of Orchids and foliage; Messrs. Jenkinson and Sons, Newcastle, were second; and Mr. D. Ffoulkes, Newcastle, third. The best bouquet for the hand—a charming

Gooseberry, Wonderful (much reduced).

This is a smooth, dark purple Gooseberry, of very good flavour and fair cropping qualities.

arrangement—came from Messrs. Jenkinson and Sons; Messrs. Perkins and Sons a close second; and Mr. D. Ffoulkes third. Again Messrs. Jenkinson and Sons were first with a ball and bridal bouquet, the former purple, pink, and yellow Orchids, the other white Orchids; Messrs. Perkins and Sons, who came second, had much the same colours, the workmanship very good in each case; Mr. W. Vause was third. The best stand of cut flowers also came from Messrs. Jenkinson and Son, while yellow and orange Orchids were charmingly arranged on one of the silvered branched stands with which we are now familiar. Mr. J. C. Waterhouse was second with a similar stand, blush and orange Orchids being prominent; Mr. Lashmore, Market Drayton, was third.

**SWEET PEAS.**—There was but one entry in each of the three classes for Sweet Peas. Special prizes were offered by Mr. H. Eckford, Wem, and Mr. R. Sydenham, Birmingham. The only exhibitor in each case was Mr. W. Shropshire, Market Drayton; the leading varieties: Hon. F. Bouverie, Prince of Wales, Coccinea, Hon. Mrs. Kenyon, Blanche Burpee, Miss Willmott, Captain of the Blues, Princess of Wales, Salopian, &c. In the committee's class for twelve varieties Mr. W. Marple, Penkridge, had some fine blooms of Othello, Countess of Radnor, Lottie Eckford, Sadie Burpee, Emily Eckford, &c.

#### Fruit and Vegetables.

**FRUIT.**—The leading class was for a dessert table decorated with flowers and foliage, and not less than fourteen dishes of fruit. The first prize fell to Mr. Jordan, gardener to T. Corbet, Esq., Droitwich, who had white and black Grapes, Peaches, Nectarines, Strawberries, Figs, &c. The Grapes, arranged on sloping baskets, with vases of Ixias and elegant foliage, this worked out at 114½ points. Mr. J. H. Goodacre, Elvaston Castle Gardens, was second; he had much the same arrangement of fruits, and employed Spanish Broom, Heuchera, and Gypsophila, 110 points; Mr. J. Read, Bretby Gardens, was third with eighty-nine points. The best dinner-table arranged with flowers and foliage was set up by Mr. W. Vause, Leamington, pink Sweet Peas and Carnations being employed with elegant foliage; a charming arrangement. Mr. A. H. Hall, gardener to J. C. Waterhouse, Esq., Macclesfield, was second; he employed pink Sweet Peas and blush Roses, with appropriate foliage. Mr. W. F. Vernon, Smethwick, was third.

Mr. Jordan came in first with twelve dishes of fruit; he had Black Hamburgh and Muscat of Alexandria Grapes, a Queen Pine, Thomas Rivers and Royal George Peaches, Lord Napier and Pineapple Nectarines, two Melons, Strawberries, and Figs. Mr. McPherson, gardener to the Earl of Londesborough, was second; he had Muscat of Alexandria and Black Hamburgh Grapes, Violette Hâtive and Stirling Castle Peaches, Lord Napier and Elruge Nectarines, a very fine Queen Pine, Melon, Strawberries, &c. Mr. J. H. Goodacre was third. With six dishes Mr. T. Bannerman, The Gardens, Blithfield, Rugeley, was first; he had Black Hamburgh Grapes, Royal George Peaches, Early Rivers Nectarines, Brown Turkey Figs, Melon, and Strawberries. Second, Mr. J. Read, with Royal George Peaches, Pineapple Nectarine, Kirke's Plums, Figs, Strawberries, Melon. Third, Mr. Nicholls, gardener to Lady Beaumont, Carlton Towers, York. Mr. Nicholls had the best four bunches of Grapes, black and white, staging Black Hamburgh and Buckland Sweetwater, both very good. Mr. J. Read was second with the same varieties; Mr. Goodacre was third with white Muscats as a white. Mr. A. H. Hall was first with two well-finished bunches of Black Hamburgh, Mr. Goodacre was a good second, and Mr. Nicholls third. Mr. Bannerman came first with any other black, having Madresfield Court; Mr. Hall was second with the same. Mr. Bannerman also gained the first prize with two bunches of white Muscats, short thick bunches, fairly coloured; Mr. McPherson was second. Any other white was Foster's Seedling from Mr. Bannerman; Mr. Nicholls coming second with Buckland Sweetwater. Peaches, Nectarines, and other fruits were shown, but time did not admit of particulars being taken.

Vegetables were fairly well represented in competition for prizes by Messrs. Sutton and Sons, Webb and Sons, and others.

A number of classes were set apart for gentlemen's gardeners and amateurs, plants and cut flowers being shown, also for cottagers and children, but it was impossible in the limited time at our disposal to gather up particulars.

Miscellaneous collections were of great assistance in making a display, and gold medals were awarded to Mr. W. B. Child, Birmingham, for a large collection of hardy flowers; to Messrs. Dicksons, Limited, Chester, for the same; to Messrs. Blackmore and Langdon, Twerton Nursery, Bath, for a splendid display of double and single Begonias of the highest quality; and to Mr. John Forbes, Hawick, for Pentstemons and Phloxes in pots. Silver medals were awarded to Messrs. Harrison and Son, Leicester, for hardy flowers; to Messrs. Hewitt and Co., Solihull, for the same; to Mr. Henry Eckford, Wem, for Sweet Peas; to Messrs. Jarman and Co., Chard, for plants; to Messrs. Jenkinson and Son, Newcastle, for flowers; and to the Ranelagh Nursery Company, Leamington, for plants. Some bronze medals and certificates of merit were also awarded to collections.

#### Richmond Horticultural, July 1st.

The Horticultural Society of Richmond held its twenty-ninth annual show on July 1, and judging from the attendance it must have been a great success. The Public Recreation Ground, where the show was held, is an ideal place for a flower show. The Recreation Ground is eighty-seven acres in extent, and consists of large open stretches of grass, studded here and there with fine old specimen trees, isolated and in groups. The tents in which the show was held were three in number, and they were separated from each other by large open spaces.

Roses usually form one of the principal attractions of the show, but this year they were much less in evidence than usual, while many of the blooms were much below what is usually considered exhibition form. The chief honour in the Rose classes fell to Messrs. F. Cant and Co., of Colchester, who obtained the cup with a fine exhibit of good flowers, among which the varieties Mrs. Edward Mawley, Cleopatra, La France, Frau Karl Druschki, Mamie, Bessie Brown, Marquis Litta, Souv. de Président Carnot, Ulrich Brunner, Star of Waltham, and Mildred Grant were conspicuous. In other classes this firm also obtained prizes. Messrs. B. Cant and Co., of Colchester, and Messrs. Prior and Son, of the same town, also obtained several first and second prizes for exhibits of good blooms. A large group of mixed Roses, in which most of the new varieties were included, was shown by Messrs. Ware, of Feltham; it was very bright, and attracted much attention. The group was not for competition, but the society presented a silver medal.

Of amateur collections that shown by Earl de Grey (gardener, Mr. J. Smith) was by far the best. All the blooms were good, the following being very noteworthy: Mrs. W. J. Grant, Caroline Testout, La France, and Margaret Dickson. This group was not for competition. Among amateurs who competed for prizes, the following collections were noteworthy: Mr. W. Wilson, first prize; Mr. W. J. Palmer, first prize; and Mr. W. C. Romaine, first prize.

Herbaceous plants were not so much in evidence as usual. In the class for twenty-four distinct varieties there were two exhibits, both being very good. The first prize was awarded to the Right. Hon. Earl of Dysart, Ham House, Petersham (gardener, Mr. F. F. Conway), the second going to Mr. H. L. Warde, Petersham House (gardener, Mr. A. Allum). In both lots *Lilium umbellatum* and *L. croceum* were conspicuous.

Table decorations were very conspicuous, and some very fine effects were produced. First prizes were obtained by Sir C. Swinfen Eady, Oatlands Lodge, Weybridge; Miss N. H. Cole, The Vineyard, Feltham, and by Miss C. B. Cole of the same address. The arrangements of wild flowers were effective, the first prize being awarded to Miss Amy Freshwater, 50, Queen's Road, Twickenham. Special mention may be made of a very fine basket of flowers arranged by Miss C. B. Cole, the principal flowers used being scarlet *Gladiolus* and *Lilium longiflorum* with *Asparagus* and Grasses. It was awarded a first prize.

A superb group of Malmaison Carnations, not for competition, were exhibited by J. P. Morgan, Esq., Dover House, Roehampton (gardener, Mr. J. McLeod); this was one of the finest groups in the show. The Rev. A. W. Owen, the Old Palace, Richmond, showed several fine pots of *Lilium auratum*. A few Sweet Peas were exhibited, Mr. T. H. Bolton, Baron Hill Gardens, Beaumaris, taking first prize. For six plants of *Coleus*, Mr. J. Sallows, gardener to Mrs. Cooper Coles, Heddingham House, Twickenham, was first with fine well coloured plants; C. M. Bartlett, Esq., Upland, East Sheen (gardener, Mr. H. Hicks), being second, and Mr. H. Munn, gardener to Mrs. Griggs, Queensbury House, Richmond, third.

For six Fuchsias, Mr. Sallows was again placed first with fine, well grown and well flowered plants; Mr. Munn being second with smaller, well-grown plants. In the middle tent several fine groups of plants were to be seen. The centre was taken up for the greater part by a fine group of Palms from Mr. J. Bruckhaus, St. Mark's Nurseries, Twickenham. It was awarded a gold medal.

In the same tent Messrs. Fromow and Sons had a fine group of Japanese Maples and other foliage shrubs, together with a fine lot of *Kalmia latifolia* in full flower. This was awarded a silver medal.

A fine group of mixed flowering and foliage plants from Sir F. Wigan, Bart., Clare Lawn, East Sheen (gardener, Mr. C. Want), obtained a first prize; the second in the same class going to C. M. Bartlett, Esq. Another very nice group of plants, which obtained a first prize, was that from Mr. H. E. Fordham, The Nurseries, Twickenham. *Gloxinias*, *Liliums*, *Cannas*, *Crotons*, and *Ferns* were conspicuous. Messrs. Russell, of Richmond, were awarded a gold medal for a fine group of well-coloured *Crotons*, *Alocasias*, *Aralias*, and *Caladiums*, as was also Mr. W. Thompson, Sheen Nurseries, Richmond, for a group of flowering and foliage plants. Mr. Iceton, of Putney, showed a fine lot of Lily of the Valley, *Lilium longiflorum*, *Hydrangeas*, and other things. In the same tent was a group of six *Ferns* from Mr. C. Want, which obtained a first prize. All were large and well grown. They were as follows: *Davallia Mooreana*, *Adiantum farleyense*, *A. speciosum*, *A. tenerum roseum*, *A. Mariesi*, and *Asplenium Veitchii*. An interesting group of Succulents was shown by Mr.

R. Anker, Addison Nursery, Napier Road, Kensington. A group of Orchids, exhibited by Sir F. Wigan, Bart. (grower, Mr. W. H. Young), was awarded a gold medal, and a group of six fine plants from the same gentleman obtained a first prize.

Vegetables were well shown by Lord Aldenham, Aldenham House (gardener, Mr. E. Beckett), and he obtained several prizes. Fruit was shown in good condition by Sir C. Swinfen-Eady, Earl Dysart, and others. The allotment holders of Richmond and neighbourhood as usual made a very good exhibit of vegetables and cut flowers, all the lots staged being good. Outdoors, Mr. J. Russell, of Richmond, showed a fine group of tree Ivies, the varieties worthy of special mention being Gold Cloud, *flavescens*, *elegantissima*, *maculata aurea*, *rhomboidea ovata*, and *digitata aurea*. For the group a gold medal was awarded.

### Portsmouth, July 1st.

On the Clarence Esplanade Pier, Southsea, the first Rose show of this society was held, and was in every way a success. Neither the classes nor the exhibitors were numerous, but the exhibits were quite of average quality. If Roses were not of huge size, they were bright and shapely.

The principal class was that for forty-eight distinct varieties, single trusses. For the first prize of £5 three competed, although a greater number entered. Messrs. D. Prior and Sons, Colchester, somewhat easily secured the leading prize with an even collection of medium-sized, brightly-coloured blooms. Especially noticeable were the following: Mdme. E. Boullet, La France, Gustave Piganeau, Caroline Kuster, A. K. Williams (rich), Madame Gabriel Luizet, Mrs. J. Laing (very fine), Maman Cochet, Duke of Edinburgh, Margaret Dickson, Marquis Litta, Francois Michelin, Ulster, Ulrich Brunner, Lady Mary Fitzwilliam, Bessie Brown, and Duchesse de Morny. Mr. G. Mount, Canterbury, was second with smaller and less even blooms; Killarney, Caroline Kuster, Général Jacqueminot, Mildred Grant, and Fisher Holmes were the most noteworthy. Messrs. Rogers and Son, Bassett Nurseries, Southampton, third.

For twenty-four trebles, distinct, Messrs. Prior were again the most successful, staging a capital set. A. K. Williams, Mrs. John Laing, Marquis Litta, Caroline Testout, Helen Keller, Kaiserin Augusta Victoria, Ulrich Brunner, Catherine Mermet, Souvenir d'un Ami, Antoine Pavoire, La France, and Rubens were extremely fine. Mr. Mount followed with smaller examples.

Tea varieties in single trusses were a strong class. Messrs. Prior once more asserted their superiority by winning first place with an even stand of high-class blooms—Devoniensis, Edith Gifford, Souv. d'Elise, Maman Cochet, Souv. de S. A. Prince, Medea, The Bride, and White Maman Cochet were conspicuous. Messrs. Mount and Rogers followed in the order here given. Messrs. Prior were again invincible in the classes for twelve Hybrid Perpetual dark, light, and twelve Tea or Noisette, with capital examples in all classes. Mr. Mount followed. In the last named class Mr. Prinsall, gardener to Mrs. Cecil, Ryde, was second with a creditable stand.

Garden Roses in eighteen distinct bunches were a distinct feature, so finely were they staged. Mr. G. Ellwood, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, easily won the premier award with a grand display of the following varieties: Mdme. Eugène Resal, Papa Gontier, Leuchstern, Mdme. Plantier, Gustave Regis, Common China, Gloire de Mousseuses, Cheshunt Scarlet, Fellenberg, Félicité Perpetué, Moschata alba, Gloire des Polyanthas, Wallflower, Queen Alexandra, Psyche, Euphrosyne, and Général de Butriol; second, Mr. Pruce, gardener to J. R. Winthorpe, Esq., Ryde. Bouquets were splendidly staged by Mr. E. Wills, florist, Southampton, both ball and bridal. Mr. R. W. Foot, 82, Palmerston Road, Southsea, second in both classes.

Hardy cut flowers were a distinct feature of the show, so numerous and good were they. For twelve bunches, distinct, Mr. G. Leek, Binstead, Isle of Wight, was the most successful, staging the following in good order: Baptisia australis, Gladiolus Colvilli The Bride, Gaillardia maxima, Stenactis speciosa, yellow Lupin, and Delphiniums; Mr. Ellwood, second; Mr. E. Prince, third. Cut stove and greenhouse flowers and table plants were a good display. Mr. Ellwood won for both with desirable exhibits. In a smaller class for table plants Mr. Wills was first, followed by Mr. Papworth, gardener to the Portsmouth Parks Committee. Mr. F. Romer, as hon. secretary, had all the arrangements well in hand.

### Canterbury Rose, July 2nd.

A few weeks ago the outlook for the twenty-fifth annual exhibition of Roses in the ancient cathedral city looked anything but bright, but fortunately the clerk of the weather has been kinder of late, with the result that if the show held in the Foresters' Hall on July 2 was not so good as some of its predecessors, it was much better than expectations. Most of the old exhibitors turned up in fairly good force, and Mr. Cooper Wachter secured the three-guinea cup for eighteen blooms with fairly good specimens: Colonel Pitt, another well-known exhibitor at Canterbury, came second, and Mr. R. West third. The Rev. H. B.

Biron grows his Roses on the top of a wind-swept cliff overlooking Dungeness Bay, but for all that he is one of the most successful growers in the Hop county, and secured first prize for twelve blooms, first for six, as well as an award for exhibiting a premier bloom. By his success the genial vicar of Lymington proved once more that Roses can not only be grown, but be grown well under trying circumstances when in the care of a true rosarian. Mr. J. Stanley won with eighteen varieties in the class open to growers of less than 1,000 plants, followed by Miss A. M. Hawksworth and Mr. H. Foster. Mr. H. Foster had the best twelve blooms in this division, Miss Hawksworth being second, and Mr. J. Stanley third.

In the three classes open to growers of less than 300 plants, the prizes were won by Mr. E. Murton, Canon Holland, Lord Teynham, and Mrs. Saunders. Miss Margerison had the best, eighteen blooms in the division open to members growing less than 150 plants, Mr. S. Collard being second. For twelve blooms Mrs. Saunders was first, Miss Margerison second, and Mr. D. Amos third. In the classes open to members irrespective of number of plants grown, honours were fairly evenly divided between Mr. J. Stanley, R. E. West, Colonel Pitt, Cooper Wachter, and the Rev. H. B. Biron.

### Reading and District Rose, July 2nd.

One would have thought that Reading could not have waited till 1903 ere having a Rose Society and Show of its own; but we here record the first annual exhibition, which, unfortunately, has fallen on a bad season, and yet a satisfactory turn-out appeared. The show was held in Forbury Gardens, a few minutes' walk from the principal streets in Reading, and which is admirably suited for the purpose. The best feature in the show were the Garden Roses in class 5, but some really charming Teas were staged in Divisions B and C.

CUT BLOOMS: DIVISION A.—A challenge cup and 20s. was accorded in class 1 for the forty-eight distinct blooms, which on this occasion went to Messrs. Alex. Dickson and Sons, Ltd., Newtonards, co. Down, whose flowers were all of good form, though, of course, undersized this year, and not so well coloured as in sunny seasons. They had choice blooms, however, of Mildred Grant, Bessie Brown (beautiful form), Edith D'Ombraire (one of the finest), Marquis Litta (firm and good colour), Gustave Piganeau (exceptionally bright), Marchioness of Dufferin (rather tight, with pointed petals), Marchioness of Downshire, a beautiful stout Rose; Ulster, small but creditable, and Helen Keller. The second prize fell to Mr. Geo. Prince, Longworth, Berks, with Gustave Piganeau, K. A. Victoria (a beauty), Perle des Jardins, The Bride, and Mrs. S. Crawford, but the flowers were ragged and weak. Mr. Turner, of Slough, fell third.

Mr. Prince, of Longworth, led for two dozen Teas and Noisettes, having a fair flower of Mrs. E. Mawley, but the others were very poor. He also staged blooms; and for twelve blooms of one variety, Mr. Thos. Rigg, of South View Nurseries, Caversham, was deservedly first with a very even set of Bessie Brown. Mr. Turner was second with Mrs. J. Laing; and Alex. Dickson and Sons, Limited, third with Mrs. Mawley. In the succeeding class for twelve distinct sorts, in trebles, Mr. C. Turner's set was bright and showy. His Ulrich Brunner made a good impression, and both G. Piganeau and Mrs. J. Laing were strong. Messrs. A. Dickson and Sons, Ltd., were rather far behind as seconds, and the set was very mediocre. Third came Mr. Prince, out of four entries.

Mr. Geo. Prince had a splendid selection of eighteen bunches of Garden Roses in class 5, beautifully arranged over black velvet. This was certainly the feature of the show, and comprised lovely bouquets of Mme. A. Carrière, Bellefleur, Bardou Job, Aglaia, The Garland, and W. A. Richardson. Mr. C. Turner, the only other exhibitor, was awarded second.

DIVISION B.—Mr. Thos. Rigg was far and away the finest exhibitor of two dozen distinct sorts, his Bessie Brown, Horace Vernet, Helen Brunner, and Tom Wood being up to a good standard. Mr. J. R. Tranter, of Henley, was second. Again Mr. Rigg led for the twelve Teas and Noisettes, with Mr. Tranter second, and Rigg's set of twelve Bessie Brown in class 8 were well set up and fair blooms.

DIVISION C.: AMATEUR CLASSES, OPEN.—Mr. Conway Jones, Huddersfield, Gloucester, beat Mrs. E. Croft Murray, Perivale, Ryde; third falling to Mr. W. C. Romaine, of Old Windsor. Mr. Conway Jones staged his blooms to good effect. Class 10 was vacant; and the next brought four entries (for twelve T's or N's), the premier award falling to Rev. F. Page Roberts, with decidedly superior blooms for the season. His Innocente Pirola was an A1 flower, and Comtesse de Nadaillac was finely coloured. Mrs. Croft Murray, of Ryde, again showed the way for twelve distinct blooms in class 12, having Bessie Brown; Mr. Romaine was second with Mrs. J. Laing; and third, Mr. D. H. Evans, of Pangbourne.

DIVISION D.: LOCAL CLASSES.—The challenge cup here for the eighteen went to Mr. Romaine with a creditable set, and Rev. F. Page Roberts furnished a very close second; five exhibiting in

**Red Currant, Raby Castle** (reduced one-quarter).

*This is a very noted variety, a rapid grower, the fruits ripening later and hanging longer than those of any other variety. The bunches are long and the berries large.*

this place. For the twelve T.'s or N.'s (c. 16), Rev. Page Roberts' set were highly creditable, the Comtesse de Nadaillac being one of the medal blooms of the show. The same exhibitor was foremost for six of any T. or N., having beautiful blooms of Niphetos. Another prominent exhibitor in the local classes was Mrs. Ashby, of Ashdene, Reading, who had really fine samples in classes 19 and 21. The majority of the other classes were, however, exceedingly poor.

**DIVISION H.**—Mr. R. C. Mount beat Mr. H. W. Dunlop, of Maisonet, Garley, in class 30, for twelve bunches of garden Roses, and each lot was creditable. Mr. Mount used more foliage, set out his bunches more widely, had plenty of sweet buds, and green moss beneath the glasses, so that his exhibit was very effective.

For the six bunches of Garden Roses in class 31, we found no name attached to the first, but Miss Ashby had a sweet lot as second, and these were set loosely in a square box, the varieties being all of the Rambler type, like Aglaia, The Garland, Crimson Rambler, Euphrosyne, and Lord Penzance Briar Rose Bradwardine—a beautiful exhibit. Mr. Hudson, of the Deanery, Sonning, was second out of five lots.

In the Strawberry classes, Mr. J. R. Tranter, of Henley, led for three dishes, and also one dish.

**MISCELLANEOUS EXHIBITS.**—Messrs. Cutbush and Son exhibited Marguerite "Coronation," Carnations, and Verbenas; while "rural decorations" came from a midland firm. Mr. E. W. Hudson, of the Deanery, Sonning (gardener, Mr. Sumner), arranged a small, but effective, display of decorative Roses in glasses, taller vases being at the back, and a wide-mouthed jar in front, giving the display both depth and height. Sprays of The Garland Rose were twined on the table beneath the glasses, the latter containing long stemmed Roses like Viscountess Folkestone, Eugene Resal, Caroline Testout, and Marie Van Houtte.

The secretary is Mr. W. Walker, of Dunollie, Bulmershe Road, Reading.

### Norwich, July 2nd.

The National Rose Society would be doing a work of great assistance to Rose shows and exhibitors if it would invite all affiliated societies to send representatives to an annual meeting to mutually arrange the dates of shows, so as to avoid as much as possible the clashing of exhibitions in the same district with each

other or with National fixtures. The M.C.C. manages this extremely well in county cricket, and I do not see why the N.R.S. should not do it with Rose shows. Exhibitors have had some genuine cause for grumbling for some years; last year the Coronation was said to have upset everything, but I do not know that matters are very much better this year. With the National Show at the Temple on Wednesday, and Colchester and Norwich on the Thursday, East Anglian amateurs have been put to the inconvenience of finding it practically impossible to show at more than one of the three.

The Norwich Society, which is one of the oldest in the kingdom, and gives as good prizes as any, with the exception of the N.R.S., held its show on July 2 in the convenient grounds of Carron Abbey, where the N.R.S. held its northern meeting about seven years ago. The day was very hot, the tents were like ovens, and Rose showing consisted simply of trying to keep Roses in decent form till the judges had seen them. It is a farce in which there can be no pleasure, for it was impossible to hope that many of the Roses could be worth seeing by the spectators in the afternoon. One always longs for the Crystal Palace on such a day; no place like it for a Rose show in my opinion, but I am an old fogey now.

The only professionals present were the representatives of the three Colchester firms, and the Roses were much below par. For forty-eight blooms, B. Cant and Sons were first, having good specimens of Bessie Brown, Mrs. W. J. Grant, and Papa Lambert. F. Cant and Co. second, with Mildred Grant and Bessie Brown, good, and Prior and Son third.

In eighteen trebles exactly the same order was preserved, though the competition was close. The first prize winner had a good level stand, and the second had very fine trebles of Bessie Brown and Mildred Grant, but had also some very weak exhibits. In the class for eighteen Teas, Prior and Son were just first with a very badly set up stand; F. Cant and Co. following most closely with a particularly well-staged box; B. Cant and Co. third. There were no Teas of note in any of the boxes, and these three classes gave a good deal of trouble to the amateur judges, a very few points in each case separating the exhibitors. In twelve new Roses, F. Cant and Co. were first, and B. R. Cant second, and even here there were no blooms which seemed to call for special mention. There were no exhibits in the open class for Garden Roses.

In the amateur principal classes, Rev. A. Foster-Melliar was first for thirty-six, having as his best bloom Lady Moyra Beauclerc, which gained the medal as the best H.P. or H.T.; Rev. A. L. Fellowes second, and Miss Penrice third. In eight trebles, Reginald Steward, Esq., was first (a Mrs. E. Mawley, not particularly good, but perhaps the best choice, gaining the Tea medal); Mr. Foster-Melliar, second; and Miss Penrice, third. In twelve Teas, Mr. Foster Melliar was first, having a magnificent Cleopatra, which with another in his thirty-six were quite the best he ever cut, but they both collapsed under the heat; there were also a good Mad. Hoste in this box, and a very fine, though not large, example of Georges Schwartz of magnificent colour; Mr. Fellowes was second, and Mr. Steward third.

In twelve H.P.'s and H.T.'s of one variety, Miss Penrice was first with La France, Mr. Foster-Melliar second with Mrs. J. Laing, and Mr. Fellowes third with La France. In twelve Teas of one variety Mr. Fellowes was first with Maman Cochet, clean, though small, and Colonel Rous second with Niphetos, poor. There is always, for some reason, very little competition for the cup offered for twenty-four to Norfolk exhibitors, but fair stands considering the weather were shown. Miss Penrice was first, showing Marie Cointet (a Rose I have not seen for years), and Catherine Mermet well; and Mr. Fellowes second, with fair specimens of A. K. Williams and Marchioness of Downshire. A few Garden Roses were shown, but they were badly staged in exhibition boxes, instead of in vases as they should be. Single Roses and Sweet Briars should be shown, if possible, as Mr. Frank Cant displayed them at Holland House, some 2ft. or 3ft. of the old wood being staged upright, with the flowering sprays naturally growing from them.—W. R. RAILLEM.

### Windsor and Eton, July 4th.

The twelfth annual exhibition of the Windsor and Eton District Rose Society was held on Saturday on the beautiful slopes of Windsor Castle. The Queen's cup, given by Queen Victoria, for forty-eight distinct Roses (open to all England), was awarded to Messrs. Harkness and Co., of Hitchin, Herts. The cup must be won three times to be taken possession of outright. Messrs. B. R. Cant and Co., of Colchester, and Messrs. Dickson, Newtownards, Ireland, had each won it two years. In the local amateur classes the Windsor cup, for eighteen, distinct, went to Mr. Colin Romaine, The Friary, Old Windsor, for the third time running and becomes his property. Mary, Duchess of Sutherland's cup, for the best display of cut blooms, went to Mrs. Irving, Old Windsor, also for the third time, and becomes her property. The National Rose Society's silver medal in the professional classes for the best bloom went to Messrs. Harkness for a Mrs. John Laing, and the medal for the best bloom in the amateur classes to Mr. R. Foley Hobbs, Worcester, for a Bessie Brown.

### Sutton Rose, July 4th.

From our report which follows, it will be gathered that, on the whole, a very good exhibition was got together on Saturday last by the Sutton (Surrey) Amateur Rose Society in the grounds of Manor Park School. A number of medals, cups, and pieces of plate were awarded in the local classes. Curiously, no Garden Roses were entered, though one class was set apart for them, and their absence at a Rose show in these days makes the exhibition incomplete. These are the days of decorative Roses. The committee and Mr. Nightingale deserve congratulations on the success of their efforts, and the day proved ideal for an event of this kind. The sale of flowers in aid of the funds of the Cottage Hospital, and a pastoral play, are two features of the occasion to which allusion should be made.

**DIVISION A: OPEN TO ALL AMATEURS.**—The first class on the schedule (the coronation cup class) required a dozen flowers in distinct sorts, and Mr. A. Tate's set from his extensive collection at Downside, Leatherhead, was first, though Mr. E. B. Lindsell made a really good bid for the leading honours, which he must have missed by only a few points. Both collections were as fine as any likely to be seen this year, the blooms being large, smooth, and well shaped, and of good colours according to the varieties. Mr. Tate's Ulrich Brunner at top left-hand corner was a massive flower; his Bessie Brown was fair, but the second prize winner had a better; and his other four reds were Suzanne Marie Rodocanachi (perfect), François Michelin, Dr. Sewell, rich and strong; and Gustave Piganeau, of a light colour. His other blooms were fair. Mr. Lindsell's Ulster was a firm, fine flower; Frau Karl Druschki, of immense size, purity, and with reflexing petals making a keen point. This is going to be a grand exhibition flower. The third place out of five entries fell to Mr. E. M. Eversfield with small flowers.

The two dozen blooms came in the second class, and Mr. Lindsell staged the best set, though these were below the average in quality of the foregoing twelve. His Bessie Brown was large, but marked on the wing petals; Frau K. Druschki was good in petal, but loosely built; White Maman Cochet was sweet; Dr. Sewell was intensely rich, and with very thick petals, a fine bloom; and lastly, Ulster was a fair, good flower, with undersized. Mr. A. Slaughter was second with a very poor lot, and the third prize went to Colonel T. H. Pitt. For eighteen varieties Mr. Tate beat Mr. E. M. Eversfield, and Mr. G. H. Baxter followed third. Mr. Tate had respectable flowers of Mildred Grant, Bessie Brown, Horace Vernet, A. K. Williams, and K. A. Victoria, and the second prize winner had a beautifully coloured flower of Madame G. Luizet and a small but good Horace Vernet. Messrs. Tate and Lindsell were placed in this order for the eight distinct trebles, the two sets making a favourable show, and magnificent samples were seen of Bessie Brown, with that lovely flesh tint over the inner petals; and K. A. Victoria was also grandly staged. Nor could one find much fault with Mr. Lindsell's Mrs. J. Laing and A. K. Williams, or Mr. Tate's Caroline Testout, Horace Vernet, and Gustave Piganeau. The third place out of four was awarded to Mr. Eversfield with good A. K. Williams, K. A. Victoria, and Mrs. Laing.

Five competitors staged each a dozen Teas and Noisettes in class 5, Rev. F. R. Burnside leading the way against Mr. Tate (second), Mr. Eversfield (third). The flowers were small and poor, except for pretty Maréchal Niel, Mrs. Mawley, and Maman Cochet in Rev. Burnside's set; and a large bold flower of Mrs. Mawley (quite a salmon-tea-pink shade), in Mr. Tate's.

**DIVISION B: GROWERS OF LESS THAN 1,000 PLANTS.**—In the sixth class nine distinct blooms were required, and Mr. J. T. Thompson arranged a highly creditable selection, having Ulrich Brunner, Mrs. J. Laing, F. Michelin, and Dupuy Jamain in fine form; the second place falling to Mr. G. H. Baxter with handsome flowers of Lady M. Beauclerc, Mrs. S. Crawford, and Marquis Litta, the latter inclining to coarseness. Mr. E. Wilkins was third. For the four distinct, in trebles, Mr. Thompson again proved his superiority, and staged excellent Mrs. Laings, Brunners, Michelons, and Duke of Wellington; Mr. Baxter being a good second with highly pleasing blooms of White Maman Cochet, Mrs. S. Crawford, Caroline Testout, and Bessie Brown; and Mr. Wilkins again came third. This was one of the best classes for quality of blooms in the exhibition. For nine Teas in class 8 Mr. Baxter led, with Mr. Wilkins next.

In Division C, for a collection of Garden Roses, there were no entries.

**DIVISION D: NURSERYMEN'S OPEN CLASS.**—A brilliant array of good flowers comprising five separate entries was furnished under class 10 for thirty-six varieties, the first prize of £3 falling to D. Prior and Son with generally heavy and smooth flowers. Their Helen Keller was a perfect bloom, and others of distinction were seen in Horace Vernet, Duke of Edinburgh, Gén. Jacqueminot (large), Ulster (grand tone), Bessie Brown, Daisy (a lilac-purple), Frau K. Druschki, Xavier Olibo, and Caroline Kuster. R. Harkness and Co., of Hitchin, succeeded as seconds, in which place they were hard upon Priest and Son, and had a sweet Jean Ducher, and representative samples of Marchioness of Downshire, which is a lovely flower; Dr. Sewell, Madame G. Luizet, Alf Colomb, Madame C. Ramey, Mrs. Laing, and La France of

'89. The third award fell to B. R. Cant and Sons with very small flowers, except a fine Bessie Brown and Frau Karl Druschki.

The latter won premier place for the twenty-four distinct, having capital Roses; there were Crown Prince at its best, Beauty Lyonnaise being on one side of it and forming an extreme contrast. Frau K. Druschki, Gén. Jacqueminot, Comte Raimbaud, Tennyson (small, but strong and good otherwise), and Mildred Grant, better here than elsewhere. Second out of five came Prior and Son, and third R. Harkness and Co.

F. Cant and Co. led for the twelve Teas and Noisettes with clean, if small, flowers of Golden Gate, Medea, Souv. de S. A. Prince, Rubens, Cleopatra, Mrs. Mawley, Muriel Grahame, The Bride, and Ethel Brownlow; and Messrs. Prior were again second out of five entrants, and staged a perfect gem in Maman Cochet, having a beautiful high-pointed centre, lovely wings, and charming colour tones. Paul and Son, of Cheshunt, followed third.

**DIVISION E: LOCAL CLASSES.**—The competition in this section was moderate, but some good and well set-up flowers were on view. The leading awards were captured by E. J. Holland for twelve blooms in nine varieties; and second, A. E. Farnden. Mrs. West had the best nine distinct, and was second to E. J. Holland for six Teas. K. H. Gifford had the best half-dozen of one variety with Mrs. Laing; and E. E. Grimson came next with the same variety. K. Gifford again won for the six distinct kinds in class 17.

In the few remaining miscellaneous classes, comprising Sweet Peas, Gloxinias, Begonias, and table plants, the forenamed winners were still appearing. Mrs. West's Sweet Peas and those of G. K. Wright were really good; and so were E. J. Holland's three handsome Adiantums. Mr. W. Palmer had a trio of greenhouse plants, comprising a well-flowered Show Pelargonium and two Begonias; and E. Holland followed. For a basket of Roses (W. A. Richardson) Mrs. E. Grimson alone staged. The same lady led for the hand bouquet, and Mrs. E. J. Holland had the best spray and two buttonholes. In class 25, for a basket of Roses, Miss Gladys Holland beat Miss Sylvia Farden, and third came Miss Alabaster, each with pretty exhibits. Four decorated dinner tables were arranged, and here Mrs. Brown was placed foremost with Iceland Poppies and Selaginella thinly wound round the base of the glasses on the cloth; second, Miss E. Hewetson with W. A. Richardson Rose bud, Adiantum, Asparagus Sprengeri, and Golden Honeysuckle set in "Rural Decoration" stands; third, Mrs. Holland, with Mrs. W. J. Grant Rose, Grasses, and Selaginella, but this was too heavy. Miss M. West was highly commended.

From Messrs. Peed and Sons, of Roupell Park Nurseries, West Norwood, there came an exhibit of Sweet Peas in pots. "Rural Decorations" were staged by a local firm, and Palms came from Morse Bros., Epsom.

### Harrow Horticultural, July 7th.

This is the fiftieth year of the society's existence, but nothing special was done on that account. The exhibition was held in the grounds of Mr. J. J. MacAndrew, at Dudley Lodge, and was really excellent; good in Roses, strong in ladies' decorative classes, not lacking in fruit, having a large and creditable selection of herbaceous cut flowers and annuals, and lastly, a representative department for vegetables.

Mr. E. Mawley, who spoke at the luncheon in the Queen's Head Hotel, complimented the treasurer (Mr. L. Pawle), the joint secretaries (Dr. Williams and Mr. Spencer), and committee on their well-appointed plans, and as an old visitor he also noted how great had been the improvement in the staging of the flowers. Referring to the Temple Rose Show, he observed that the N.R.S. had to rely largely on their green baize, in lieu of flowers, and wished they could hold their show a week later.

N.R.S. medals were given for the best blooms. Messrs. Prior won with Bessie Brown in the open classes, and Mr. F. Spencer secured both the amateurs' medal and the members' for the same flower, a large, though loose sample of Mildred Grant.

**CLASS 1: OPEN TO ALL GROWERS IN ENGLAND.**—The Harrow ladies present a Challenge Cup here, as premier award for thirty-six distinct Roses, the winners last year being B. R. Cant and Sons. On this occasion, however, the honours fell to D. Prior and Son, of Colchester, whose stand contained the N.R.S. medal bloom, an exquisite Bessie Brown. With this one must draw special attention to Robert Scott, which Mr. Prior speaks of as both a good grower and a staying flower. The colour is soft rosy-blush, and the rounded form is very pleasing. Mrs. Mawley was yet another splendid flower, and his Comte Raimbaud, Mildred Grant, Prince Arthur, and White Maman Cochet were each good. F. Cant and Co. came second with a decidedly poor set, their best being Frau K. Druschki and Tennyson. B. R. Cant and Sons were next with a good Mildred Grant (large and deeply tinted) and Comte de Raimbaud. There were four entries.

Prior again led for the dozen Teas and N's, having moderate flowers of Maman Cochet, Madame de Watteville, Mrs. E.

Mawley, and Jean Ducher, of a coppery hue. Second came F. Cant with Lady Roberts, Souv. d'Elise, The Bride, and Mrs. Mawley. Third out of six came Mr. Orpen with fresh flowers of Bridesmaid, White Maman Cochet, Medea, Hon. E. Gifford, Madame Hoste, and Maman Cochet, the latter of a rich purplish tint.

Messrs. Paul and Son, of Cheshunt, were quite alone in class 3 for twelve bunches of garden Roses. They staged Perle d'Or, Marquis de Salisbury, Madame Jules Grolez, L'Innocence, Madame Ravary, Madame A. Chatenay, W. A. Richardson, Gustave Regis, Reine O. de Wurtemberg, Camoens, Crimson Rambler, and Liberty. These were all firm in the bud state.

**CLASS 4: OPEN TO ALL AMATEUR GROWERS.**—Four competitors were forward for twenty-four Roses, and Mr. E. B. Lindsell, of Bearton, Hitchin, was placed first with a massive stand, his flowers being heavy, well formed, pure, and of good colour. Mrs. S. Crawford, Bessie Brown, Mrs. W. J. Grant, Mrs. J. Laing, and S. M. Rodocanachi were the finest, though the new Alice Lindsell (after the colour of Mildred Grant), also La France and Louis Van Houtte, were each very fine. This set carried Lewis Pawle's Cup. Mr. Orpen was second, and Mr. E. Mawley third.

For twelve Roses, not open to exhibitors in class 4, Mr. A. Munt, of Hedgerley, Slough, beat Mr. W. G. Adcock, The Briars, North Finchley, and third came Mr. G. A. Hammond, from Burgess Hill, Sussex. Competition here was keen, there being seven entries, and some smart blooms were staged. Frau K. Druschki, Bessie Brown, Marchioness of Londonderry, and Horace Vernet were the pick of the whole seven sets.

In the same section, class 6, for twelve T.'s or N.'s, the Rev. F. R. Burnside, Stambidge Rectory, Essex, was placed prior to Mr. O. G. Orpen, and third, Mr. A. Munt. Mr. Burnside's flowers were all cut young, yet they made a goodly show. The form and smoothness were good. He had good flowers of White Maman Cochet, Mrs. E. Mawley, Anna Olivier, Caroline Kuster, Innocente Pirola, Golden Gate, Medea, Muriel Graham, and Madame Cusin.

For the twelve Teas and N.'s in class 7 Mr. Lewis Pawle was placed first with smooth, fresh blooms, his best being Madame C. Ramey, K. A. Victoria, Caroline Testout, S. M. Rodocanachi, and White Maman Cochet. The second place was accorded Dr. Williams with François Michelin, S. M. Rodocanachi, Marguerite Appert (an uncommon H.T., after Marquis Litta type); also La France, Bessie Brown, and a sweet flower of Mrs. S. Crawford. Mr. Williams' blooms had suffered from the winds, but did him credit. Third came Mr. J. R. Cater.

**OPEN TO GARDENER MEMBERS OF THE SOCIETY ONLY.**—For a dozen distinct Lewis Pawle led, having an even stand of beautiful flowers of the leading up-to-date sorts. Mr. Spencer, one of the secretaries, had the best six; a grand set they were, one being the medal bloom in this section, an exquisite and very large Mildred Grant. He also had Tennyson, Lady Clanmorris, Clara Watson, White Maman Cochet, and Bessie Brown, each choice. Mr. A. Mitchell followed next with a good C. Testout and Abel Carrière. In Mr. F. Spencer's leading six T.'s and N.'s (class 9) the selection was again a fine one, there being Jean Ducher of grand colouring, and a lovely Mrs. Mawley flower. Dr. A. H. Williams was decidedly behind, as second, and Mr. Cater third. Again Mr. Spencer led for the quartette of one kind, having White Maman Cochet, fine firm samples. Mr. Mitchell and Mr. Pawle were second and third respectively. For the three vases of cut blooms Mr. Spencer beat Mr. Hargreaves, and third came Dr. Williams, each showing tastefully. Mr. Hargreaves had the best four bunches of garden Roses, and Dr. Williams furnished an A1 second.

**CLASS 13: OPEN TO AMATEUR MEMBERS ONLY.**—The lead was taken for six kinds by Mr. A. Bryans, who included a splendid Heinrich Schultheis; and second, Mr. Burton. In the succeeding class for a vase of blooms the lead was with Mr. A. J. Obermayer, and Captain Johnson was next.

Class 15 opened the cottagers' section, which was a small one, and the best exhibitors were Mrs. Whitfield, Mr. Mower, Mr. J. Allen, and Miss Tooth.

Amongst miscellaneous flowering plant exhibits there were some floriferous Begonias, and Mr. Hargreaves did best. He also led for six plants in bloom, and Mr. Charles had the premier award for a specimen flowering plant, equal with Mr. J. A. Stuart.

The cut flower classes were exceptionally good, the bunches being well set up, fresh, and comprising a nice selection. In class 25, for a collection, Mr. S. Gardner was in the forefront, followed by Mr. Hargreaves and Mrs. Charles in this order. For the twelve bunches of cut flowers, Rev. C. E. Owen was placed in the forefront; Mr. E. Graham following, and Mr. L. Pawle third. This was a really good feature of the exhibition.

Sweet Peas formed another section of merit, though had they been set wider apart, and on tiered tables, they would have been much more effective. In class 28, for twelve bunches, Mr. Pawle was first; Mr. Stuart, second; and Mrs. Charles third, there being five entries. Messrs. A. K. Carlyon, Hopkins, and Howson were placed in this order for six bunches of Sweet Peas. A set of twelve Pansies from Rev. Mr. Owen brought him first honours, and they were very creditable.

Fruit and vegetables formed distinctive sections, and the exhibitors already named secured the prize. Strawberries were exceptionally large and firm; but the keen competition and the greatest interest was centred on the vegetables, which occupied nearly two of the long tables. Mr. Gardner led in class 41 for six kinds; and Mr. S. Lithgow was second; the third going to Mrs. Charles. Mr. Stuart led for four kinds.

For a group of plants, Mrs. Charles led before Mr. S. Gardner; but the latter had the best specimen foliage plant—a shapely *Adiantum*.

No less than ten decorated tables were arranged in competition (class 124), and extraordinary interest was evinced in the judging of them, and the show they furnished. Eventually the foremost place was awarded to Miss Evelyn Macandrew with a lovely arrangement in soft blush pink. This included Cornflowers, Gladiolus, and Gypsophila in bowls, Asparagus being wound round the edge, and pink muslin beneath the bowls. Miss O'Neill came second with blue Sweet Peas; glasses being in each corner and one in centre, with a trail of Smilax extended to each. The third prize went to Mrs. A. Mitchell with a fearful design in blue Cornflowers, Eryngiums, and Smilax. It was much too heavy. The judges wisely gave their reasons for withholding prizes in certain cases by a written explanation on the back of the cards. This consoles and teaches.

Miss Beatrice Langton beat Mrs. G. A. Holme for the centre table decoration, having a new glass form of flower holder, shaped like the frame of a boat with glasses on either side, which were filled with Rose buds. Miss Macandrew furnished a very tasty basket of cut flowers (class 125), and beat Mrs. Middleton and Miss D. Prior.

Amongst non-competitive exhibits were Sweet Peas from Mr. Eckford, of Wein (a fine collection, and much admired); Caladiums from Mr. J. Lion, of Stanmore; and Carnations, Sweet Peas, Roses, &c., from Messrs. Cutbush.

### Metropolitan Public Gardens Association.

**OPEN SPACES.**—At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., on Wednesday afternoon, the Earl of Meath, chairman, presiding, it was agreed to offer to lay out the disused burial grounds of St. George the Martyr, Holborn, and St. Botolph's, Billingsgate, and the Bridewell Burying Ground, Dorset Street, E.C., subject to their maintenance being secured. Progress was reported with regard to schemes for acquiring Poplar Churchyard and St. Peter's Square, Hammersmith, but it was stated that the latter fine enclosure was in danger of being built on, unless the offer made to the association on the part of the owners was accepted by the Borough Council. It was agreed to make representations to the London County Council, which body had recently purchased similar squares at a far higher figure. A contribution was voted towards the fund being raised for the addition of eighty acres to Hampstead Heath at a cost of £48,000, and it was reported that a strong committee had been formed, with the Earl of Meath as vice-president, and Mr. Shaw Lefevre as chairman. A letter was read from the Duke of Devonshire stating that he was negotiating for the sale of his freehold interest in the well-established garden of the Royal Horticultural Society at Chiswick, lease of which was being surrendered by the society, and he could not therefore facilitate its transfer to the local authority, as proposed by the association. A letter was read from the Duke of Westminster, in which he expressed his wish to present the handsome shelter seat in the Duke Street garden to the association for re-erection elsewhere, and it was decided to thank the Duke for his kind gift, and to remove the structure to the new ground at Merton Road, Wandsworth, which is to be opened on Saturday. A lady member of the association also wrote offering to provide the association with funds for the erection of a much-needed drinking fountain in Nelson Square, Blackfriars, which enclosure had recently been secured for public recreation by the London County and Southwark Borough Councils. It was decided to offer to plant trees in Bedford Row, Lamb's Conduit Street, and Queen's Road Circus, Battersea, and it was stated that twenty-four out of the twenty-eight metropolitan borough councils had given their assent to the association's proposal to secure an extension of Section 43 of the Public Health Act Amendment Act to London, so as to enable London authorities to plant trees in thoroughfares. Seats were granted for Hanwell Recreation Ground and Downhill Ground, Tottenham.

### Gooseberries versus Business.

Several of the popular varieties of Gooseberries now ripening in the vicinity of London are souvenirs of the big Gooseberry show boom among the Lancashire operatives between sixty and seventy years ago. The exhibitors were skilled in crossing suitable sorts, so as to procure fruit that would scale the heaviest. These shows were conducive to great irregularities on the part of the mill workers, and pressure was put on the Gooseberry growers to have them stopped. Still, we are indebted to the craze for some of the finest varieties of the fruit now in cultivation.

# THE BEE-KEEPER.

## Removing Surplus.

The removal of the honey is one of the anticipated pleasures of bee-keeping, and generally impresses the novice more than anything else during the whole of the season's manipulations. The operation usually takes place in most parts of this country in July, as the honey harvest is on the wane at the end of that month, after which the bees are only able to obtain sufficient for a hand-to-mouth existence. The main points in removing comb honey are to preserve the inviting whiteness and completeness of the cappings, and to avoid anything approaching stickiness in its appearance, therefore great care is necessary to prevent damage to the cappings by improper handling. A little smoke should be gently driven in at the top of the super as the quilt is taken off, and if the honey is fully sealed over, the smoke will cause the majority of the bees to retreat to the lower portion of the hive, when the removal of the sections may be effected without any trouble, and empty sections substituted for the full ones when necessary. If, however, there are many combs unsealed, the smoke will frighten the bees, causing them to stuff themselves with honey, and there is more difficulty in expelling them. Under these circumstances it is best to shake the section to dislodge as many bees as possible, and blow the stragglers off. The operation should be rapidly carried out, because as soon as frightened, the bees will commence making innumerable pin holes in the cappings through which they stuff themselves.

This is a forcible argument against the use of super clearers for removing sections, as in lifting the super the bees are frightened, and they will not hesitate to break the cappings of the cells. The work of clearing supers for extracting purposes has been considerably facilitated by the invention of an ingenious contrivance called the super clearer. With this admirable appliance, if the operation is carefully performed, the bees scarcely know that they have been interfered with. It is advisable, however, to clear by this plan in the evening. The supers of honey must be lifted completely from the hive and set upon the board fitted with the super clearer, then both are placed on the hive again with the escape in the proper position, and by the early morning the bees will have left the upper portion for the brood nest, and the box may be lifted off perfectly free from bees and carried inside. Should a few remain, as is sometimes the case in cold weather, they should be brushed off with a feather. The simple cone in the hive roof answers the same purpose as the super clearers, but the method of clearing is somewhat different, and there is more excitement. In order to clear by cones, first remove the quilt from the top, lift the supers off, cover the brood nest with the quilt, setting the whole of the tier upon it with the top combs exposed, and replace the lifts and roof. The bees finding themselves queenless are soon in an uproar, and as the only points of light are the cones, they are not long before they are hurrying through them pell-mell.

So soon as the supers are cleared they must be removed, as if left too long, the bees return, and in attempting to gain admission get excited, and fighting often ensues. Every effort should be made to prevent robbing, and in all these operations care must be taken to leave no broken pieces of comb about, as after the removal of the honeycomb these are frequently causes of robbing, and should be guarded against by narrowing the entrances of hives, and performing any lengthy operations in the evening, so that if the aroma of the honey should disturb the apiary, and robbing commence, the approach of night will prevent any great loss by fighting.

It is seldom the case that colonies capable of defending themselves fight with one another. It is only those stocks which are weak in numbers, or nuclei which are attacked, and another frequent cause of robbing and fighting is carelessness in feeding. When honey is plentiful there is little or no danger of robbing; but in time of scarcity, if syrup is spilled about hives, or strange bees are allowed access to feeders, it will cause quite a commotion. Weak colonies should, therefore, have extra care and attention bestowed upon them, the entrances being narrowed until only one bee at a time may enter, and if any honey or syrup is spilled it should be covered up immediately with soil, or sprinkled with carbolic acid. If robbing is already in progress, it may sometimes be stopped by placing a cloth damped with carbolic acid on the hive front, or smearing the entrance with a few drops on a feather. This will frighten the aggressors, preventing them from alighting, and will enable the attacked to defend themselves better.—E. E., Sandbach.

## Swarming.

In consequence of the late season and the continued heat, swarms will be very common. Many are at a loss to know what is necessary when the swarm issues. One of the best assistants is a good garden syringe, and of course the skep and a cloth, to say nothing of a pail of water. Generally, not always, the bees cluster under the alighting board for a day or so before swarming.

When this is observed a good watch should be kept between the hours of 10 a.m. and 4 p.m., and if the weather be very warm, as early as 9 in the morning. When the air seems alive with bees after the issue of the swarm, bring the syringe into play, and you will soon be rewarded by the bees clustering near. It is rare that first swarms rise and go off before first settling, but casts or after swarms often play this trick, and it is almost useless to try to prevent them. The best course to prevent this is to cut out all queen cells except one after the hive first swarmed, taking care to leave one good cell.

## How to Hive.

When the swarm has clustered well, and looks like a bunch of grapes, give them a slight syringing, and this will cause the bees to tighten their hold and to huddle a little closer together. If the branch on which they have settled be of no practical use, and can be easily cut off, then sever it, placing it on the outstretched cloth, and the skep over it. Raise one side of the hive with a large stone, so that bees can easily get in, and also for the purpose of ventilation, because they are in a very heated state. If the branch is valuable or too thick, then hold the skep mouth upward, and give the branch two or three sharp shakes, and the bees will generally fall into the hive; then overturn the skep on the cloth as above; syringe the spot where the bees first settled to dislodge the stragglers who remain. These cases are very simple to deal with. Sometimes they settle on the trunk or large limb of a tree; if the skep can be placed over the swarm, proceed to drive the bees up by means of the smoker, or take a brush and place the skep underneath and brush them into it, and then use the syringe. Proceed in the same manner if the bees prefer a wall.

People often marvel when an expert bee-keeper is seen handling bees fearlessly and without stings at swarming time. The truth is that the bees have gorged themselves with honey, in order that they may build a new home, for wax is prepared from honey in the body of the workers, and they cannot, if they would, turn the abdomen to the correct angle for stinging. Leave the bees in a shady place until evening, i.e., after 6.30 at this time of the year, and then remove to permanent quarters. Many may think that this will make no difference, but I remember, when a novice, the trouble it caused me, for I placed them in their permanent quarters six times and then failed. They settled quietly enough in the straw skep and remained in the frame hive when tossed in the evening.—HYBLA.

## A Fungus Disease of Young Fruit Trees.

(EUTYPELLA PRUNASTRI (SACC.))

Every now and again this minute but very destructive parasite appears under the form of a disease wave, causing a very considerable amount of damage, hundreds, or in some instances thousands, of young trees being injured or completely killed during one of these sporadic attacks. Young standard fruit trees, up to the age of eight years, are most liable to the disease, and as the stem or stock is the part attacked, the girdling of this portion of the plant by the fungus growing in the bark and cambium means the death of the entire tree, which in a dull and damp season favourable to the rapid growth of the parasite, usually occurs during the spring following the first year of attack.

In the case of nursery stock, Plum (especially the variety called Victoria) and Apple trees have suffered most severely in this country; Peach, Apricot, and Cherry to a less extent. The fungus is also often very abundant on wild Plum, Bullace, Blackthorn, &c., and it is the spores produced on such wild trees that infect cultivated stock. The first indication of the presence of the disease is the premature yellowing and fall of the leaves, followed by a drying up, browning, and shrivelling of the bark of the stem. During the spring following the first year's inoculation, numerous minute, elongated cracks, arranged in dense clusters, appear in the dried-up bark. These represent the first form of fruit produced by the fungus (Fig. 1), and are followed during the second season after infection by larger, fewer, and more irregularly scattered cracks, always transversely arranged in the now dead bark, containing a second and more highly developed kind (ascigerous) of fungus fruit (Fig. 3). The spores of the fungus are mature during late spring and early summer, and it is at this season that infection of young fruit trees takes place, the spores gaining access to the stem either through the unprotected ends of pruned twigs or through the living bark itself. All wounds on the stem exposed by cutting off shoots, however small, should be protected at once by a coating of gas tar, until the tree is at least ten years old. If this precaution is neglected, spores frequently alight on the newly-formed wounds, where they quickly germinate and spread upward and downward in the living bark, which becomes discoloured; finally the fungus bursts through the bark it has killed, and produces spores on the surface (Fig. 6).

In order to prevent spores from germinating on the surface of

the stem, and then entering through the bark directly, the entire stem of the tree should be painted with the following composition:—Reduce softsoap to the consistency of thick paint by the addition of a strong solution of washing soda in water. Add 1lb of powdered quicklime to every 5 gals of the dissolved soap, and stir the whole until thoroughly mixed. Apply to the trunk with a paint brush, being careful to cover every part. This mixture is tenacious, not easily dissolved by rain, and usually lasts for one season if properly made and applied.

Up to the present the disease has only been observed on a large scale where the trees are growing in stiff clay. Under such conditions it is very important to avoid deep planting, otherwise the roots are liable to be killed owing to the presence of stagnant water, lack of air, &c., during a continuous rainy period, especially in spring or early summer. If the trees are not actually killed by this means alone, which is very frequently the case, their vitality is considerably weakened, and they are thus rendered more susceptible to the attacks of parasitic fungi. In a case of an extensive attack which the Board of Agriculture investigated in the county of Nottingham in 1902, the trees had evidently been seriously crippled by being planted too deep in a strong soil, and were consequently specially susceptible to attack. It is important that the fungus should be recognised by gardeners, as its frequent occurrence on wild trees in hedgerows might lead to the infection of nursery stock in a wholesale manner, as has in fact taken place, more than once, unless detected and removed without delay. All diseased plants should be burned at once, as, if allowed to lie about, the spores mature on the dead wood, and are scattered by wind, a risk of further infection being thereby incurred.

The Board of Agriculture would be glad if recipients of this leaflet would make it known to others interested in the subject. Copies may be obtained free of charge and post free on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

### Hardy Fruit Garden.

**STRAWBERRIES.**—Ripe Strawberries should be gathered daily while firm and in perfect condition, for not only are they then of superior quality, but will keep fresh longer, and at the same time the plants are relieved, and are able to develop and perfect the remaining fruits. It is, of course, indispensable to net over all beds as soon as the fruits commence to colour, but the nets must be arranged in a portable manner so that they are readily removable for gathering the fruit. Thin out any deformed, weakly, or small fruits where fine specimens are desired, and assist development by a few applications of liquid manure.

**PROPAGATING THE PLANTS.**—An early selection of suitable runners should be made, especially where it is desired to form fresh beds to fruit next season. Generally the most convenient method of rooting is to layer the runners into pots filled with good loam, or on the surface of squares of turf about 3in thick. In some cases where the runners are not too numerous they may be rooted in the soil between the rows, breaking up the position a little and adding some fresh material. Secure the runners with a peg or a stone, cutting off the wire extending beyond the plantlet. During rooting plenty of water should be afforded, and other runners must be prevented crowding them; indeed, as many as possible may be cut out entirely, which will permit of plenty of air and space, which is very important in preventing the leafstalks lengthening unduly and the crowns forming weakly, instead of boldly and strongly. It is important that the runners be selected from plants that have or are fruiting satisfactorily, as nothing can be more disappointing than to find plants failing to fruit. It is not necessary that the plants should be bearing exhaustive crops. Those of normal strength and medium fruit-bearing capacity are the best, and almost certain to produce runners of the proper character.

**SUMMER PRUNING CURRANTS.**—The suppression of superfluous growths should not be longer delayed. In the case of Red and White Currants the side growths on the main branches must be shortened back to three pairs of leaves. If extension is necessary for the leading branch a leading young shoot may be left full length, otherwise shorten in a similar way to the side shoots. Strong growths which have been produced from the old wood may be utilised to form new branches if they originate near the base. Old trees may be renovated and improved in this way. The growths, which should be selected in suitable positions, may be left full length now, shortening them in winter. Similar shoots not required cut out entirely, also any suckers issuing from below the ground. The object of summer pruning is to open up the fruit to light and air, and also to ripen and perfect the fruit buds or spurs for the succeeding season. Black Currants must be treated in a different manner if any summer pruning is carried out in their case. It is best to do it after the fruit is gathered, because, as a rule, the growths or shoots carrying the crop are those which need removal. Those it is desirable to retain for the successional crop are the strong shoots of the current season. If regulated now, or when the fruit is cleared, therefore little winter pruning will be required.

**LAYING IN WALL TREE WOOD.**—If the growths of Apricots, Peaches, Nectarines, Morello Cherries, and Plums upon walls or espalier fences are in a crowded condition, owing to inability to properly deal with them earlier from various causes, this should be rectified as early as possible now. It is important that this should be done, alike for the benefit of the fruit as well as the appearance and condition of the trees generally. Being properly regulated and not burdened with surplus wood, full encouragement is given for the perfecting and ripening of the shoots intended for fruit bearing. The present crop, too, has a better chance of attaining size, quality, and colour. It is best to cut out the weakly and ill-placed shoots first, retaining a number from which a final selection may be made according to the space available. It cannot be exactly determined how many are required until the fruit is gathered and the old bearing growths cut out, but a general idea may be formed.

**CORDON TREES.**—The summer pruning of cordon trees may be carried out now, as the leaves on the summer shoots are fully grown on the lower parts. Shorten Apple and Pear shoots to four full-sized leaves. Allow the leading growth, especially on young trees, to extend without stopping, so long as there is room.

**THINNING FRUIT.**—On all choice Apples and Pears grown as half-standard, small bush, pyramid, or any restricted form,

1.—*Eutypella prunastri*; spore-bearing form of reproduction on an Apple tree stem. Nat. size.

2.—Spores.  $\times 600$ .

3.—Second, or ascigerous, condition of fungus-fruit on Plum stem. Nat. size.

4.—Section through a group of ascigerous fungus-fruits embedded in the bark.  $\times 50$ .

5.—Ascus containing eight ascospores.  $\times 400$ .

6.—Median section through portion of the stem of a young Apple tree, showing where the fungus had entered through the unprotected ends of pruned shoots. The mycelium of the fungus had discoloured the bark and wood, and finally burst through the bark to the surface. Nat. size.

it is possible to thin the fruits if a crop has set so freely as to render it worth while to reduce the number in order to obtain superior fruits in size, form, quality, and colour. When fruits can develop beyond a medium size for the variety, they are better able to show forth the special characteristics of each. Quantity should be sacrificed for quality and appearance. It is better for the trees in a general way, imposing as it does less strain upon them. Clusters of several fruits may with advantage be reduced to two, or even one fruit on a spur. Plums ought also to be thinned to secure fine dessert fruit.—EAST KENT.

### Fruit Forcing.

**CUCUMBERS.**—A few seeds may now be sown for late summer and early autumn produce. The plants from this sowing will afford much finer fruit during the late summer and early autumn months than plants that have been in bearing a considerable time, as old plants generally produce knobbed (seeded) fruits towards the end of the season, and are neither so handsome nor useful as straight seedless fruits. The seedlings will be fit to plant in about a month, and succeed admirably in frames with a little bottom heat, such as may be afforded by partially spent manure, mixed with a little fresh, but not rank, stable litter. It is needless to say that the plants succeed in houses or pits, such as after clearing from bedding-out plants or placing of plants outdoors, and give a supply to a late period of the summer or even autumn where there is sufficient heating power.

**PLANTS IN FULL BEARING.**—In order to keep up a regular succession of fruit, attention must be given to thinning exhausted growths, removing bad leaves, stopping, tying, and regulating, so as to keep up a successional growth of bearing wood. Add a little fresh soil to the surface of the bed from time to time, with a light mulching of sweetened horse droppings or cow manure, the latter dried and broken up, and sprinkle on a small handful per square yard of soot. Syringe at closing time, and maintain a good moisture all day by damping the floors in the morning, noon, and early in the evening. Avoid too much moisture in dull weather, as it makes the foliage soft, and more liable to attacks of leaf-spot fungus (*Cercospora melonis*), and the growths cannot well bear the sun after a return to bright weather. After a few days of dull moist weather it is advisable to shade, and keep the house rather close on a bright period ensuing. Supply liquid manure copiously once or twice a week, but it will not materially benefit plants sparsely furnished with roots and defective in foliage. What such plants want is fresh soil or surface dressings of lumpy material.

**VINES SWELLING THEIR CROPS.**—A genial condition of the atmosphere, secured by gentle warmth in the hot-water pipes and sprinkling the paths and borders in the morning and afternoon, particularly the latter at closing time, is essential for the swelling of the berries and health of the foliage. The border being mulched with a little short, rather lumpy sweetened stable manure, about an inch thickness sufficing, and this sprinkled occasionally, will give off some ammonia to the atmosphere, and nutriment be washed down to the roots at the waterings. If a little sweetened material be added from time to time, the supply of ammonia vapour and of liquid nourishment will be regular and never so excessive as to injure the foliage. If not convenient to use stable manure, the neat drainings of stables or cow houses may be diluted with six times the bulk of water, and this used for sprinkling at closing time, about 3 gals sufficing for a square rod of border or 30½ square yards. Avoid a close atmosphere, particularly in dull weather. A little ventilation at the top of the house constantly will make all safe; but it is desirable to close the house in the afternoon, damping well at the same time, allowing the temperature to rise to 90deg or 95deg, and after six o'clock provide a little ventilation at the top of the house, as it will prevent excessive deposition of moisture through the night. This will to some extent safeguard the foliage against scorching should the sun act powerfully upon the house before the ventilation is increased, which it ought to be as soon as the sun reaches the structure; indeed, it is the best preventive of scorching and scalding. A night temperature of 65deg and a genial warmth of 70deg to 75deg by day, will be sufficient by artificial means to keep the Grapes steadily progressing in dull weather. Increase the ventilation from 70deg to 75deg, allowing it to advance to 80deg to 85deg, and close so as to raise it to 90deg or 95deg. Permit a steady growth in the laterals, but never allow large extensions, which must afterwards be removed or considerably reduced. Do not allow the laterals to interfere with the principal leaves, for upon the free access of light and air depend their elaborating power, and the more these assimilate the crude material, the healthier the Vines are, and the more food storing in the Vines for the succeeding crop. It is also essential for the formation of the coming Grapes in embryo in the buds.

Supply sufficient waterings or liquid manure as required, or afford surface dressings and water them in after having made the border thoroughly moist. Outside borders must not be neglected, but have copious waterings where the rainfall is deficient. Mulch the borders lightly. Heavy coatings do more harm than good. A little stable manure, 1in to 1½in thick, will lessen evaporation,

and from its lumpy nature not deprive the soil of the beneficial action of air, warmth, and the moisture of dew and rain.

**MELONS.**—When old plants are in good health and free from insects they will then fruit freely on the laterals, even when the current crop is swelling, but these blossoms will not set unless syringing is discontinued, which is not advisable, so that lateral growths should be encouraged to insure fruit showing when the present crop is advanced for ripening, and these will set freely with the drier atmosphere, and the crop be somewhat advanced before, or by the time the fruit is cut. The plan is then to cut away such old growths as are useless, and concentrate the energies of the fresh growth on the young fruit. Encourage root growth. Give supports to the fruits before they become heavy, letting the table slant so as not to hold wet, and place slates beneath the fruits of plants in frames, raising them above the foliage on small inverted flower-pots as the swelling advances. Fertilise the flowers daily until sufficient fruits of equal size are set on a plant; then remove all the flowers, and reduce the fruits to three or four on a plant according to its vigour. Shade only to prevent flagging; it is most needed in bright weather succeeding a dull, moist period. Melons directly exposed to the sun are benefited at such times, otherwise they are apt to be scorched, and when ripening are all the better by a slight shade, especially when the plants do not supply moisture to the fruit from indifferent health. Repot any plants requiring it, and keep them sturdy by placing them near the glass. Keep a sharp look out for canker. It often arises from damp, and the remedy is a drier atmosphere or freer ventilation, and rubbing quicklime into the affected parts, keeping them quite dry by repeating the process.

**EARLY PEACHES AND NECTARINES.**—The trees having been cleared of the fruit, cut away the wood on which it has been produced to the successional shoot at the base, and stop growths making more than 12in to 14in of wood required for bearing next year, always excepting extensions, which may be allowed to grow where there is room. Pinch the laterals at the first leaf, and to subsequent as made, thinning where crowded. Syringe forcibly to expel red spider, and if necessary apply an insecticide. Admit all the air possible, and where practicable withdraw the roof lights from the earliest forced houses. Maintain a proper condition of moisture in the outside as well as inside borders.

**LATE HOUSES.**—It is only possible to have fruit very late by keeping the houses as cool as possible, ventilating day and night, but not in windy weather, this causing the current to rush through the house and dry the atmosphere excessively. Nothing is gained by that, but often a rich harvest of battered leaves and a plentiful crop of red spider. This pest must be laid low by forcible syringings in the morning and late afternoon, the trees having also plenty of water and nourishment at the roots, with mulchings of partially decayed lumpy manure, and these kept moist will keep the roots near the surface. About an inch thickness is sufficient.—ST. ALBANS.

## Trade Note.

### An Imperishable Horticultural Paint.

Mr. Chas. T. Druery, as manager of the Lubroso Paint Company, Moorgate Station Chambers, E.C., calls our attention to a paint recently introduced into this country, which is admirably adapted for the protection of wood and ironwork in conservatories or greenhouses. It is entirely distinct from oil paints, having an imperishable rubber-like body as a basis, so that the paints form an elastic and strongly adherent skin, which cannot crack, blister, or flake off, and stands both heat and damp indefinitely. As no priming is required, and two coats equal in covering capacity four of oil paints, they are very economical in application, apart from greater permanence, while their appearance is equal to the best expensive enamel paints. An enormous Continental consumption and an experience of five years demonstrates their value beyond a doubt.

### Seacombe Recreation Ground.

The new recreation ground at Seacombe is a great tribute to the powers of the Wallasey District Council, marking as it does a new departure in their policy, and one that must prove of incalculable benefit to the working classes more especially. A few evenings ago, crossing over by the ferry steamer, and thence to the Ground by car, I was more than delighted to see how eagerly the various games were being contested, splendid quoiting grounds, fine bowling greens, and a host of side shows for the juniors, were evidently appreciated to the full. The shrubberies have all been planted, and most judiciously too, judging from the luxuriant growth. Standing on high ground, with the river rolling below, it is at once health-giving to those who occupy the various seats provided. There are many councils who might follow this example of providing small grounds, instead of waiting for parks, &c., which in many cases cannot be afforded.—R. P. R.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**BOOK ON "INSECT PESTS OF FRUIT TREES"** (J. S. and Co.).—We can recommend the "Handbook of Orchard and Bush Fruit Insects," by the late E. A. Ormerod, price 3s. 6d., from Simpkin, Marshall, Hamilton, Kent, and Co., Ltd., London.

**THE LAW WITH REGARD TO CUTTING TREES, &c.** (Twenty-six Years' Reader).—The principle of law is that "whoever has the soil he has all right, even to the heaven"; that is, he can deal with everything that comes across his boundary line, and at whatever height. Hence you may cut down a tree leaning from your neighbour's property across your boundary line, provided you keep well *within* your own boundary. If, however, you have a litigious neighbour, and exceed your limit by a hair's breadth, you may become involved in an action for trespass. It would be better to give your neighbour notice in writing of the nuisance his tree is causing, and ask him to abate it himself, before proceeding to extremities.

**GRAPES SHANKING** (A. C. B.).—As the Vines have only been planted two years we should lift them after the crop is cut, and place the roots nearer the surface in good loam with wood ashes and crushed bones mixed therewith, draining the border well, and surfacing with manure. Placing strong, fresh manure in contact with the roots and making it like a puddle, as you appear to have done with syringing, would cause the roots to decay and the Grapes to shank. As your house is only small, you could easily sponge the under surfaces of the leaves with a mixture of softsoap and sulphur. Beat some sulphur into a paste, then mix it with the solution, which may be made by dissolving 2oz of softsoap in a gallon of water. This applied to the leaves as suggested and left there for three days will destroy the red spider. The mixture should be of the consistence of cream when used.

**MELON DECAYING** (B. E.).—The Melon is affected by the brown rot fungus (*Monilia fructigena*), and is perhaps the first recorded instance of its affecting Melons at the semi-ripening stage. The affection has evidently taken place at the eye of the fruit, there causing a brownish discolouration in the rind, and the outgrowths of the fungus are very pronounced in the netting, where the aerial hyphae has issued and produced an innumerable number of spores. In one place there is quite a large patch of the outgrowths, become as usual flesh coloured, and in parts black, these corresponding to the sclerotia by which the disease passes over from year to year in some cases, not in all, as mummified fruits of Apples, Pears, or Plums remaining on trees on ground give rise to conidia in the spring, by which the disease is continued. We hope to be favoured with an illustration of the disease in your fruit, and further particulars of the fungus shortly.

**SUPERPHOSPHATE OF LIME** (T. J.).—It is more useful as a manure than bones, because it is more soluble than water. If we bury a bone it will remain almost unaltered for years; but if we break it into small pieces it decays much sooner, and if put round the roots of Cabbages will soon make them grow more fine and vigorously. Cabbages, however, are not the only garden vegetables benefited by bone manure, for phosphate of lime is one of the most constant constituents of all plants. Of this phosphate, therefore, the soil is deprived by every crop it bears, and to restore this phosphate to the soil is an object with every cultivator. It was long since shown by chemists that phosphate of lime is the chief ingredient in all bones, and consequently these by degrees have become one of the most extensively used manures. In every 100lb of sheep's bones there are 70lb of phosphate of lime; in 100lb of horses' bones sixty-eight of that phosphate; and in the same quantity of ox bones 55lb. As phosphate of lime is insoluble in water, and even bone dust is slow in decaying, it was suggested that by dissolving it in a strong acid, superphosphate of lime, a substance soluble in water would be formed, and also all the other constituents of the bone be presented to the roots of the crop in a most available form. This process is said to have been first adopted by Mr. Fleming, of Borrochan, N.B., in the year 1841. He employed muriatic acid (spirit of salt) to dissolve the bones, but it was subsequently found that sulphuric acid (oil of vitriol) was both cheaper and better.

**CATERPILLAR ON LIME** (R.C.).—The caterpillar is that of the Lime Hawk moth (*Smeristhus Tiliæ*) about half grown. It is not a common insect, but occurs in many localities, some near the metropolis. It is distinguished from its brethren in the family by a curious horny plate above the tail. The food is also Elm as well as Lime, and after the winter has been passed in the pupal condition the moth emerges about the beginning of June and flies vigorously at dusk.

**CYCAS FRUITS** (J.).—A kind of Sago is produced from the pith of *Cycas revoluta* in Japan, and the nuts are edible. *C. circinalis* also yields Sago, and the fruits, which are of the size of an Orleans Plum, are eaten in the Moluccas after being fermented and roasted. We must decline the responsibility of advising you on the question of exhibiting your fruit in a collection for dessert purposes, as there is no telling whether the judges would disqualify or not, as, so far as we know, they have no precedent to guide them in the matter.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (A. F.).—1, *Brodiaea laxa*; 2, *Allium moly*; 3, *Dianthus petreus*; 4, *Polygonum sacchaliense*. (A. W.).—*Erigeron philadelphicus*. (H. J., York).—*Alyssum maritimum* (the Sweet Alyssum).

A week of bright sunshine with drying winds.

### The "Royal" Show: The Inevitable.

To prophesy after the event is to put oneself outside the pale of the true seer. We never had that faith in cheerful prognostications of some of our fellows, and we felt we could not join with them in their bright visions of a successful "Royal." We have been doubtful about the movement from the first. Well aware as we were that the exhibitions were carried on at a loss, we could suggest no scheme, recommend no panacea, but we felt that the establishment of a permanent show ground in the neighbourhood of the metropolis was a step in the wrong direction. We wish to be distinctly understood; we do not think the acquisition of the property to have been a mistake, for possibly it will turn out a valuable asset; but what we think is the mistake is the confining of the show to one neighbourhood year after year, and that neighbourhood not an agricultural one—essentially, we may say, a "desirable residential district."

We always understood one great object of the show was education—to show to the untaught and uninitiated, by means of a huge object lesson, what were the best and highest types of all the endless varieties of live stock, brought together by the most celebrated breeders, and exhibi-

bited in the very pink of perfection. There, too, would be found every conceivable kind of machinery which, directly or indirectly, facilitates the work of the farm, exhibits by no means confined to England, but the witty inventions of the cosmopolitan. Feeding stuffs, fertilisers, vehicles, horse trappings, and a thousand and one things too numerous to mention. It is at the Royal and other shows of large dimensions that all these treasures are congregated, and for whom? The man with the long purse, the man to whom the expense of railway journeys were as nothing? No, we hold that in this instance the catering was done for those poorer stay-at-home agriculturists to whom the great show and its adjuncts would come as a revelation. As an itinerant exhibition it took year by year its glorious wealth of objects to the doors of those who otherwise would never have a chance of seeing such things. The shilling day of the Royal was a royal holiday for all the rustics within a wide radius, and it is marvellous how much they would manage to see between sun and sun. The class a little above the labourer would perhaps allow themselves the treat of two days, and the members would avail themselves of the full privileges conferred by their ticket of admission.

The shows would be but poorly attended if they depended entirely on the presence of the male element. The ladies are catered for, and show up in great numbers. Many of them are keen judges of stock; some of them are exhibitors, and all are interested in the working dairy. Some go to criticise, some to learn, and the influential farmer's wife will be equally as interested as the woman from her husband's cottages. Hitherto every country district has had its turn; the big show has been, and certainly left its mark. Now, how can it be hoped that these simple country folk can get themselves up to Park Royal? It is an impossibility; and, after all, it is the shillings of the groundlings that swell the receipts.

When, twenty-four years ago, the Royal was held at Kilburn, the windows of heaven were opened, and down came the deluge—pitiless rain, unfathomable mud. Of course, everyone said the weather alone was responsible for the short attendance. When, in 1886 (that is the date we believe), the show was in Windsor Great Park, the intense heat was blamed. This year at Park Royal the weather was perfection, real outdoor weather, after much wet and storm and cold wind; weather to tempt people abroad, and yet where were the multitudes? Alas! that it should be written, they failed lamentably to present themselves before the turnstiles. The teeming hordes of London would not be drawn forth from their haunts. The objects and aims of the society find no response in their breasts. Give them Olympia, Earl's Court, Buffalo Bill, Barnum, that is more in their line. They can see no beauty in the faultless symmetry of form in the stock. They might be amused at some odd variety—say, horned sheep, Liliputian ponies, or some "American notions" among the machinery; but the real lessons of the show are quite lost upon them. We doubt whether people quite realise how small the attendance has been. Since the year 1860, of the forty-one shows held, only two have been less attended than this London one, and they were held at very out-of-the-way places; namely, at Bury St. Edmunds and Taunton. Here are some figures for previous years. Carlisle and Cardiff were both at extreme points; Maidstone ought to have drained the metropolis; Birmingham was a fixture arranged in a hurry. We will not analyse the days with their three classes of admission price, we just take the totals:—

1903, London ... ..	65,103
1902, Carlisle ... ..	93,187
1901, Cardiff (gallant little Wales) ...	167,423
1900, York ... ..	87,511
1899, Maidstone ... ..	68,576
1898, Birmingham ... ..	98,277
1897, Manchester ... ..	217,980
1896, Leicester ... ..	146,277
1895, Darlington ... ..	100,310

These figures are significant. We gave the people Royalty, we gave them a Khedive, and yet they were not satisfied. To give the show a local colour there were trotting competitions for cab horses, and there were also prizes offered for the best two or four wheeled cab horse. There was horse leaping, there were "four-in-hands," parades of prize stock, excellent music, and peerless weather. We hear those in authority talk of "educating" the Londoner, and so making him appreciate the show. How is it to be done, and why should it be done? How to do it might be answered thus: Make the show proper subservient to an

outdoor variety entertainment; erect big wheels, have sensational acrobats, import freaks, have Roman chariot races, ransack history for curious spectacular effects, wind up with fireworks and free beer, then the multitude would come; but it would be time that the Royal forfeited its charter. It has hitherto been a meeting for business and pleasure, to be worked at a profit if possible. The expenses this year must have been abnormal, and the receipts terribly small. Of course, next year's show will be run at less expense; but what about those north-country exhibitors who have been absent? Will the road be more open to them than it was last year? We fear not. Exhibiting is always more or less a risk, and a long railway journey adds materially to that risk. For the winter fat stock shows distance is not of much moment, for the stock is bound for that bourne from which there is no return.

This permanent fixture at Park Royal will, we think, have one good effect on local shows. Owners will concentrate their forces on the home and local show. They will be inclined to leave London for the home counties. We are rather reminded of parental relations—the father in course of time relinquishes his duties and relegates them to his stalwart sons. We think no worse of the father for his graceful retirement, and the sons infuse new blood into the old business. It is well when fathers know when to retire!

We are rather disposed to think that the Royal, having shown the way in the matter of shows, might usefully devote its energies to other means for the betterment of the agricultural community. Is there no means by which education may be stimulated? Can no help be given to hardworking men who only need a little capital to ensure their success? Have all available means been taken to stamp out disease? Do we know all that is possible to know respecting the best modes of cultivation? Are we, in fact, as much "up to date" as European countries and the lands beyond the seas? We doubt it.

There is one new feature at the Royal which may tend to increase its popularity as time goes on, and that is the auction sale for stock. The intelligent foreigner is always on the look out for a "good thing," and should the reserves be not too high he will be a likely buyer. Against that theory will be put the fact that already the foreigner knows where to go for what he wants. He is quite in touch with the principal breeders, and is a welcome guest at their hospitable homes. We know what a feature the sale ring has become at the Shire and other horse shows at Islington, and it may be in this fact will rest the salvation of the Royal.

### Work on the Home Farm.

Hay cutting and making has largely occupied the past week, and with glorious weather for it, everything has gone well, a nice quantity is in stack, and a great deal more in process of making. In fact, the hay harvest is decidedly forward about here, and some good stuff is being got. Clover bulks up well, but grass hay is much lighter than most farmers expected, and, as regards this district, will certainly not exceed the average, if it reaches it.

The last two weeks have seen great progress made by all grain crops. All the forward Wheat is fully shot, and looks very well, it will be ready for cutting a little earlier than we expected. All the best Barleys are shooting nicely, and present a promising appearance, but they are not so forward as Wheat.

Swedes want rain again rather badly; they are not growing as fast as we should like to see them, and do not get big enough for striking. Common Turnips are growing past them; even the last sown are up, and showing beautifully in the row, and whatever may be the result as regards Swedes, common Turnips are a certain crop. There has been no fly trouble since the rain, a most satisfactory circumstance. The horses have been occupied with the hay, but we have always managed to keep two skeries running amongst the Swedes and Turnips.

There are one or two fields of Potatoes yet unearthed up, but, as a rule, work amongst this crop is always on until lifting time comes. Crops are looking well, thanks to the fact that we escaped both frost and flood. Early Potatoes are just ready in the gardens, but the second earlier in the fields will be some time yet. No doubt growers will not be lax at marketing them as soon as they are large enough for profit.

We are feeding our horses largely on Tares, and as the cow pasture is showing signs of becoming bare shall add some Tares also to the cows' ration. A good armful of Tares at milking time saves grass, and helps to keep up the milk flow. Butter is cheap now, but July is a month when the tide of prices generally turns. Cows must have plenty of fresh water now, or the milk pails will show the neglect. Pigs in the yard are living on Mangolds and Corn. They, too, require plenty of liquid in hot weather. Old or separated milk may be mixed with water for this purpose.

## Garden Visiting.

It is the desire of the majority of people when they take a holiday to strike new ground and see fresh scenes that present a change from the things with which they are brought into daily contact; but the average gardener differs from the rest of his fellow men in this respect. In short, he is a "shoppy" animal, and the one great theme of his life is a garden. If two gardeners meet they talk shop, if a hundred are congregated together they split up into little groups and do the same thing, no matter what the particular occasion may be. It is no good blaming them, for it is a trait of the craft, though somewhat tedious to the gardeners' wives if the ladies happen to be present. Perhaps this is why gardeners' wives do not accompany their husbands on holiday excursions so much as the better halves of men engaged in other occupations.

As an illustration of the gardeners' propensity for talking shop, I recently accompanied a brother craftsman in looking over a factory containing some very intricate and interesting machinery. Our guide spared no trouble in explaining the mechanism of the machines, and while engrossed in the examination of them I did not observe that my friend was missing. However, we found him a few minutes later discussing the merits and conditions of a miserable looking Geranium that was growing in a pot in one of the factory windows, along with one of the workmen. He apologised, of course, but I believe all along that he was thinking more about that plant than of the machinery we had come purposely to see.

To many gardeners a holiday necessarily means a round of visits amongst professional friends and acquaintances, and a series of

**WEST'S COMBINED HAND FUMIGATOR AND POWDER DISTRIBUTOR,** 2/6, with Tobacco Paper, Post Free.

**WEST'S PATENT FUMIGATOR** Complete, post free, 9d. (See Catalogue for West's Extract of Nicotine.)

**EVERLASTING DOUBLE CRIP STAKES** for instantly staking all Plants. From 5/- per gross, carriage paid. Send P.C. for a Free Sample and yourself decide on its merits. It will cost you nothing, and prove to you that

CATALOGUE, containing 50 large pages, with 100 Illustrations, with Hints on Horticulture, post free.

Plants protect,  
Money Save,  
AND  
Labour Ease.

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

garden examinations. There is no compulsion about it, but it is just a matter of custom, and the gardener returns to his home quite contented with his outing. In fact, it is just his way of spending a holiday; and if he enjoys it I can see no reason why anyone else should complain.

There is a peculiar unwritten law of freemasonry which gives to gardeners the privilege of visiting each other's places ad lib, with a reasonable certainty of receiving a welcome and a readiness on part of the person visited to drop whatever task he may have in hand and show you round. If a member of any other occupation were to visit a gardener, about whom he knew but little, he would probably get straight looks and a stiff welcome; but tell the man that you are one of his own calling, and have just come for the purpose of looking round, and all reserve vanishes like vapour. As gardeners you are friends at once, and if by any chance you should happen to have lived in the same bothy at different periods the friendship develops itself into that of quite a bosom character. Nor is there, moreover, any half-heartedness about a gardener when he is surveying the charge of a brother craftsman. He takes a deep unfeigned interest in things, and if it is a characteristic of gardening human nature, for the individual visited to enlarge on the rough condition of the place when he took charge, and the improvements effected since, it is all part of the programme, and the visitor knows that he will have the privilege of doing the same thing when his friend calls on him in turn.

In its way the gardening press encourages garden visiting by publishing descriptions of different gardens from time to time; and though it is no wish of mine to quarrel with the editors for doing this, I am afraid these descriptions are not always very interesting to read. It is, of course, instructive to hear of fine establishments, but I am afraid that when the account of the visit appears on paper it often flavours rather too much of the personal. The world at large is not particularly interested to learn that Mr. So-and-So has got a fine batch of Chrysanthemums coming along, or a houseful of forced Beans free from red spider; and I mention this as a hint to those who describe gardens, to confine themselves to features of general interest and leave out details. They can keep the minor points for themselves, and find plenty of interest in discussing them with the chief of the garden visited.

I am afraid also that garden visiting is not always prompted by a purely friendly and neighbourly spirit, and I am inclined to think so because I once served in an establishment which had a reputation at that time for Chrysanthemums. Just before the shows came on in the autumn hardly a day passed but that a gardener or two dropped in, presumably to have a look round, though they took little interest in anything but the 'Mums, and the most curious thing was that almost without exception they were growers and exhibitors themselves. Of course, there was nothing out of order in the visits, and they only wanted to see how things were looking in view of the coming shows; but, bless you, they wouldn't have admitted that for anything.

I can imagine nothing more tedious to a person who is not interested in horticulture than to go round an establishment with a pair of gardeners. In the first place, they generally do the round very leisurely, stopping continually to argue of some little thing, and going back a few yards to examine something that has been overlooked. Perhaps they are old friends, and one drops a remark relating to some incident which happened in the long ago. It is quite enough, and the whole matter has to be lived over again, to the intense enjoyment of both of them. Mutual friends, too, have to come under discussion, and sympathies are extended to poor old So-and-So, who managed to lose his place, and was not fortunate enough to secure another one. This is part of the loyalty of the craft. Brothers in misfortune are neither forgotten nor overlooked, and the welfare of both the unfortunate and the successful are freely discussed when one gardener pays a periodical visit to the establishment in charge of another.

Being a gardener I willingly and readily admit to have inherited the weakness for visiting other people's gardens, but I have a decided inclination for the establishments in which I have lived and laboured in the past. This I take to be a source of great pleasure to many gardeners, for there is a peculiar sentiment that attracts you to the garden with which you have been connected in the years that are gone. Old familiar scenes strike you in a new light, you take interest in the changes that have been made in the meantime, and note the result of certain operations, for

the performance of which you were perhaps responsible. Generally, amid the changes that take place in gardening establishments, the labourers, or some portion of them, remain till old age or rheumatism necessitates their retirement, and when you visit the place after an absence of years they welcome you with a smile of unfeigned pleasure, and the grip of their horny hands is of a true and honest character. The man who has no sentiment in his soul is an individual to be pitied, for a good deal of the quiet pleasure of this life is obtained through the medium of the attribute which some people treat so lightly. Depend upon it also that the gardener who leaves a place without leaving a friend behind him, or no one to welcome him back or take an interest in his welfare, is a person whose shortcomings it is not well to inquire into.

Through the very nature of his occupation the gardener is a nomad, who flits from place to place with no surety of settling long anywhere. It is true there are many who stay for a lifetime in the same establishment, but this is their good fortune; and others, through a variety of circumstances common to the craft, have to pack their belongings again and again, and pass on to fresh scenes of labour. It may be taken for granted that these men do not forget, and when circumstances permit they take pleasure in visiting the old scenes and renewing the acquaintanceship of old friends. Sentiment may prompt it all, but I take it that it is this spirit of freemasonry and good fellowship that is responsible for the gardener's weakness for garden visiting.—H.

## Campanula garganica and its Varieties.

For planting in the rock garden, or on the rockwork edging of the flower border, we have no prettier little summer flower of creeping or trailing habit than the Gargano Harebell, as *Campanula garganica* is popularly called. It is more suited for these purposes than for planting on the level surface of the border, but it might be used to form a small bed by itself, and in this form it would be a pleasing thing for a good while during the summer months. The whole plant is rather downy, and it has kidney-shaped radical and heart-shaped stem leaves. These stems are trailing, though they are not of excessive length, so that a few plants together would make a good appearance anywhere when in bloom. The flowers, which are of good size, are of a brilliant blue-purple, with white centres, and are produced in great numbers. The actual height of the plant is only a few inches, rarely exceeding six, and it is thus one of the most useful of our dwarf flowers, from June onwards, when it comes into bloom. There are three well-marked varieties of *C. garganica*, the first to be named being the white-flowered variety of the type, and of exactly the same habit, but with white flowers. It is in every way as free as the blue form.

*Campanula hirsuta*, sometimes called a species, is even more charming than the type. It is densely covered with greyish hairs, which give quite a downy effect to the plant. Perhaps it is owing to these hairs having a deterrent effect upon the slugs, but these pests, which attack the typical plant when in gardens infested by these vermin, do not attack the hirsute form to any extent. The flowers are a lighter blue-purple than those of the type, and the whole plant is more slender and elegant in appearance. There is now in cultivation a scarce variety with white flowers. This has just been sent out from a northern nursery, and having seen it in bloom before it was for sale, I have been glad to secure it at the first opportunity. Its flowers are pure white, and it seems to be a good doer in every way. There is a considerable amount of variation in the plants of the species, but the four named may safely be taken as forming the main types of all the forms. *Campanula garganica* was originally found by Tenore on Mount St. Angelo, near Naples, in Italy, and it received its name from the old name of the mountain (Mt. Garganus). As already said, it is commonly known as the Gargano Harebell; but another, and more pleasant sounding one, is "the Harebell of St. Angelo." It was introduced in 1832. The cultivation of *C. garganica* does not present much difficulty, although it prefers a dry and sunny position, and excessive moisture is decidedly injurious to it. I find it grows more vigorously if treated occasionally to a little fine bonemeal, well watered into the soil; but this is not necessary in all gardens, and would be injurious in many. It is easily increased by seeds or by division, the latter being performed in spring. It may be said that it is sometimes beautifully grown in hanging pots and baskets, though the popularity of *C. isophylla* and *C. fragilis* has retarded its use in this manner.—S. A.

### **Phaius × Chapmani superbus.**

This is a hybrid from *P. Phoebe* and *P. Humboldti*, and was staged by Norman C. Cookson, Esq. (gardener, Mr. H. J. Chapman), at the Royal Horticultural Society's show on June 9, when a first-class certificate was accorded. Another form, not so good, and named simply *P. x Chapmani*, received an A.M. at the Temple Show. The one here figured, from a drawing by Mr. Shayler, has a purple lip with a brownish-orange suffusion on either side of the column. The sepals and petals are purplish mauve. Mr. Chapman is very keen on *Phaiuses*, and has a fine set of hybrids advancing.

### **The Week's Cultural Notes.**

*Oncidium Lanceanum*, now coming into flower, is a very charming species, but unfortunately few growers have the knack of managing it successfully. The plant has no pseudo-bulbs, but consists of loose, leathery spotted leaves rising directly from a stout rhizome. I have found it just as necessary to get these leaves properly consolidated as it is to ripen the bulbs on plants that carry them; and much of the dreaded spot that attacks *O. Lanceanum* may be prevented by this simple means.

It may seem a very unimportant matter, but there is no doubt than an hour's drying both of the roots and leaves every day would conduce much to the well-being of these warm house *Oncidiums*. If they are suspended keep the syringe away from them when damping, and as far as possible, without injury to other plants, allow the atmosphere of the house to be warm and dry for an hour or so. Then, when closing the house, do so with very ample moisture, syringing the plants overhead, and damping well about the pots, baskets, stages, and all dry places. The heat will probably run up very high, but no harm will come to the plants if the blinds are drawn up and the sun allowed to shine full upon them, for the moisture rising and settling on the glass forms a film that breaks its rays a little when the ventilators are closed.

Unlike some *Oncidiums*, *O. Lanceanum* usually carries its flowers easily until they fade, though in the case of plants not fully established or out of health it may be well to remove the spikes after about a week's inflorescence, and they will then last well in water. Another species requiring as much heat and even more light is *O. Jonesianum*. This is a block plant, thriving best on rough pieces of cork or Apple wood, with only a little sphagnum about the base of the pseudo-bulbs. These latter are very diminutive affairs, and appear at the first glance to be only a continuation of the rushlike foliage. The flowers of this species must not be allowed to remain too long on the plants.

With the great heat just now, it becomes difficult to maintain a sufficiently low temperature in the cool house. Garden mats placed on the glass instead of the usual blinds, and kept wet, are a great help, while ample ventilation night and day is necessary. Light syringing overhead and constant damping of the floors and stages is very refreshing to the plants, but heavy syringing should in all cases be avoided. Disas advancing for flower must be kept very moist at the root, and the stems and leaves must be frequently sponged to keep them free of aphids. A light fumigation just before the flowers open is always an advantage.—H. R. R.

## **Book Notice.**

### **"Orchids, their Culture and Management."**

Since the first introduction and the general culture of Orchids, many books have been published concerning these "foreign weeds with barbarous binomials," some appealing to the botanist only, others written for the cultivator, amateur and professional, and others again for both botanist and horticulturist. It is not too much to say that there are few other books within the reach of the English reader which will tell him so much, and tell it so well and clearly, of the best methods of forming and managing a collection of Orchids in the best and most up-to-date manner than this book, which is a new edition of Watson's "Orchids," revised and in the main rewritten by Mr. H. J. Chapman.

For the horticulturist Mr. Chapman has done good work here. He is well known as a skilful grower and hybridist of Orchids, and he has placed at the disposal of his fellows the knowledge and experience laboriously gained by observation and experiment during more than a quarter of a century. No one who has any knowledge of the collections of Orchids which are and have been in his charge can doubt that he possesses the secrets of success; no one who studies this book can doubt that he is willing to share them with his readers.

As in the original edition, the main portion of the work is occupied with accounts of all the genera, species, varieties, and hybrids which are likely to be met with in any collection, and these accounts are so full, so much fuller than in the first edition of the book, that it would be difficult to find an Orchid in cultivation, even a botanical curiosity, which is not here dealt with. They are arranged in alphabetical order. In all cases are given, first, a general account of the genus, with origin of the generic name, generally the conditions under which

the plants grow in their native homes, and then the conditions under which they do best in our Orchid houses. This is followed by a description of the various species in cultivation, and where any particular species requires different treatment from the others it is carefully noted. An excellent feature is that the name of the sponsor of each species is given, and all the synonyms are recorded. Looking at the confusion which exists amongst horticulturists with respect to specific and even generic names (of Orchids especially), this is a feature which will be specially valued by those who like to call things by their right names, as well as by those who sometimes buy a plant under one name, only to find out, too late, that they already have it under another.

Examples in plenty can be called to mind by any lover of Orchids. It is well to understand, under the authority of Mr. Rolfe, that the plant we know by

the name of *Phaius Warpuri* is really *P. tuberosus*, and the plant we commonly call *P. tuberosus* should be named *P. simulans*; also that the *Phaius* which we all call, or have called, *Sanderianus*, is but a variety of *P. Wallichii*, and the editor might have added that both the latter are but local forms of that old favourite, *P. grandifolius*. This is but instancing a small corner of one genus. Throughout the book the same good work is consistently done, and it must have been done at the cost of great patience and much research.

Since the date of the first edition of the book, 1890, Orchid hybrids, of merit and of no merit, have enormously increased in number. Mr. Watson described thirty-four hybrid *Cypripediums*; Mr. Chapman gives a list of over 900, with the names of

\* New edition, revised and enlarged, by H. J. Chapman, member of the Orchid and Scientific Committees of the Royal Horticultural Society. L. Upcott Gill.

**Phaius × Chapmani superbus.**

their parents. In the first edition not a single *Odontoglossum* hybrid is mentioned; in this a list of fifty is given, with their parents, recorded or supposed, together with about twenty synonyms. The records of hybrid *Dendrobiums*, *Cattleyas*, *Laelias*, and of all others whose hybrids are known, have been laboriously disinterred from the Royal Horticultural Society's Journal, the horticultural magazines, and wherever they were buried, and carefully catalogued for the benefit of the reader. For this alone the editor deserves well of all Orchid growers.

The illustrations of flowers are numerous, and most of them excellent. Many which were used in the first edition have disappeared. The greater number of those to be found in the pages of the new edition are from photographs by the editor, and amongst them are some which will be accepted as things of beauty by any reader, and which the practical photographer who knows the flowers will recognise as good examples of the photography of coloured objects. It is not alone that the light and shade have been well managed, producing finely graduated pictures with full ranges of tones, but there is clear evidence of the use of colour sensitive plates and light filters to suit the flowers to be photographed. A glance through the sections devoted to *Cattleyas*, *Odontoglossums*, and *Cypripediums* will furnish good examples. The book contains also twenty coloured plates. Where illustrations of flowers are not given the reader is referred to some other publication where an illustration is to be found.

The earlier chapters deal with Orchid houses, shading, watering, damping, ventilation, and all the mysteries of management. A description of the treatment of imported Orchids, a recommendation of many Orchids as town plants, and a chapter on insect pests follow. Then comes a very interesting botanical description of Orchids, and this is succeeded by a very full account of Orchid hybridisation. A great deal of this portion is new; not only new to the book, but new to publication. The writer has been so successful as a hybridiser that a great many people will be glad to know his methods of pollinating the flowers, germinating the seeds, and growing-on the plants. A short chapter on the question of the applicability of Mendel's Law to Orchids closes this section of the book. This is largely argumentative, and the writer has fallen into a curious error as to this law. But much wise advice is given to the beginner in the last chapter of the book as to the plants he should begin with, and how he should begin with them. And many who are not beginners, in point of time, will gain much from this chapter, whose only defect is that it is not long enough.

The taste for the cultivation of Orchids is still growing, and it is safe to say that many more will be gathered into the ranks of Orchid enthusiasts by reading such books as this, for Mr. Chapman shows that simplicity is the key to the cultivation of these plants. A clever Orchid grower once said to the reviewer, "Give Orchids just what they want, and they will grow like Cabbages." Now, they do not want many things, but they must have what they want if they are to thrive, and some of the things they want are not quite what most other plants want. Mr. Chapman tells what these things are, and, like John Parkinson of old, apothecary of London, he leads his reader through his garden of pleasure and shows him the "divers outlandish flowers, that for their pride and beauty are to be planted in gardens of pleasure for delight," and recounts to him their "nature, names, and virtues," as well as their native homes.

#### Early Potatoes from Ireland.

Ireland is following in the wake of England in an attempt to raise new Potatoes early, and in quantity, for sale to English dealers. At Clonakilty, in the South, several growers laid down land for this purpose, and as the result they have done remarkably well. The crops have turned out successful. A fortnight ago the dealers went into the district from England, and bought up the growing crops as they stood, paying at the rate of £40 an acre for them, and undertaking all the expenses of lifting and marketing the tubers. At this price whole fields have been purchased, and the Irish farmers are jubilant at their success. A crop that will secure £40 per acre net, from buyers, must be a paying one for cultivators. Further, as the result of the tests, the Irish Potato growers say they can market their early Potatoes a week or a fortnight earlier than the English growers do. They intend in future years to extend operations considerably. In trade distributive circles the success of these South of Ireland Potato producers has caused some excitement, for the areas suitable for the business in County Cork, and elsewhere, are more extensive. Dealers see that early Potatoes from this new centre will certainly affect production. The handsome margins left over after allowing for all expense in culture has somewhat surprised even the Irish Potato raisers themselves. Next season the output will be trebled at least, and within a year or two probably thousands of acres will be devoted to the crop by local growers. When the usual expense of railway carriage, salesman's commission, and market tolls are considered, it will be seen that the price paid is really equal to £50 per acre.

## Strawberries in Pots.

For securing sturdy runners, early planted ones of last year afford them soonest and best, especially when not overcropped and not neglected for watering. The plants should have shown blossoms, because runners from fruitful plants always turn out better than those from fruitless strong-growing parents. The runners may be (1) layered in the fruiting pots, (2) on turves, and (3) in small pots. All three plans are good. In any case it is essential that the first runners, which give the finest plantlets, should be selected, and that they should be induced by watering to emit roots freely at once, so that they may, by judicious attention, develop into sturdy plants and form good crowns. If layered into the largest pots they need not be detached until thoroughly established. Those layered in turves or 3in pots should as soon as rooted properly be detached and stood in a shady place for a few days, preparatory to shifting them into the fruiting pots. These may be 5in for early work, and 6in for succession or late forcing, for nothing is gained by using large pots.

For very early forcing Black Prince still holds pre-eminence as the earliest, but is very prone to mildew; otherwise, though small, is of high colour and excellent quality, forcing well. La Grosse Sucrée, however, is unrivalled for very early forcing, as it both sets and swells the fruit well, this being of good size, colour, and quality. Vicomtesse Héricart de Thury also sets well, swells to a good size when the fruits are well thinned, and furnishes fine glossy fruits of excellent quality. Royal Sovereign may be regarded as an earlier and improved Sir Joseph Paxton, and everything that can well be desired in "cropping," colour, and quality. Where few Strawberries in pots are grown it may be given place for those previously mentioned. For home use, and when true, Keen's Seedling is yet far from superseded, its cropping, deep colour, and fine quality always pleasing. Sir Harry is of similar ilk, cropping well, large, and well flavoured. President has plenty of size and good looks, and the quality first-rate, but has a bad habit of "spotting." Auguste Nicaise is perfect as a plant, the fruit large and of good colour, bears well, and the quality not indifferent, yet is excellent for supply and appearance. Sir Joseph Paxton affords full crops of large and first quality fruit, as a midseason or rather late forcer, being particularly fine grown on shelves in unheated fruit houses. For brightness of colour Sir Charles Napier stands supreme, not any having so bright scarlet face, and though a heavy cropper, and large, handsome appearance, has only a brisk flavour. Empress of India is also bright scarlet, with a flavour approaching British Queen, and ripens a fortnight or three weeks earlier, a great point in forcing. James Veitch, very large and handsome, has only moderate flavour, but forces well, especially midseason, dishes of noble appearance counting at parties.

For late forcing British Queen is supreme, Dr. Hogg being a better plant, with large fruit of the exquisite "Queen" flavour. Veitch's Perfection combines deep colour with the quality of British Queen. The foregoing are the cream of Strawberries for forcing, though good accounts are given of Souvenir de Bosuet, with medium-sized fruit, globose conical, red skin, and luscious juicy flesh, plant a vigorous grower. For cool houses mention may be made of President Delacour, large, heart-shaped, bright orange scarlet fruit and excellent flavour, also of Auguste Boisselot very large oval, deep red, and richly flavoured. Enough, and possibly more than many will require, has been given, but selection can be made, and if not in stock, most can be secured by early orders to nurserymen, in small pots, and shifted into the fruiting ones as soon as they can be had well rooted will give good results under proper management the following season.

The pots must be clean inside and outside, have a large crock over the opening, preferably a worm excluder, three or four of lesser size, and some smaller still, so as to form about an inch of drainage. This should be secured with the rougher parts of the compost rammed tightly down. Turfy loam, strong rather than light, must form the staple of the compost. Break it up roughly, adding half a pint of bonemeal (steamed), a pint of soot, and a quart of wood ashes to each bushel of chopped up loam. If these ingredients are not to be had, the advertised fertilisers answer equally well, following in each case the instructions given with them. Let the compost be moderately dry when used, for if wet it will shrink after potting, leaving the sides of the pot. Bring the soil up to the required height in the pot, ram it firmly, and finish, so that the base of the crown will be about half an inch below the rim, which must be left clear for watering, allowing a little more for the 6in than for the 5in pot. Stand the pots on a hard base in an open situation, but sheltered from strong winds, with sufficient space between them to allow the full exposure of the foliage. Give water as required, and sprinkle the foliage for a few days after potting. If this be followed each evening, it greatly assists the plants. When the roots are working freely in the fresh soil copious supplies of water will be needed, always giving sufficient to moisten the soil through to the drainage. The plants must not be allowed to flag, and the soil ought not to be soddened by needless waterings. Remove all runners and weeds as they appear.—G. ABBEY.

### Strawberry Plants at Cork Exhibition.

I have to thank you for the complimentary remarks you have so kindly made in your last issue in reference to my bed of specially prepared Strawberry plants at the Cork Exhibition; but your reporter is in error in the name of the variety, a single plant of which gave the extraordinary crop of eighty-one berries when only one year old, as Latest of All; it should have been Laxton's Fillbasket.—J. F. WILLIAMSON.

### Back to the Land.

In a footnote to his letter, "Owner and Tenant" asks me to "explain why Henry George's philosophy would, if practically applied, tend to national suicide." The practical application, I apprehend, is the primary difficulty, and even should that be overcome so far as to get the scheme afloat, there exists no precedent to guarantee success or to estimate its consequences. Such, in a general way, stands Henry George's philosophy in relation to the land, and as there exists a doubt of its success it is by far the wiser course to continue one which is supported by use and wont than launch in one whose details must be impossible to compute. It is a great scheme, and all great schemes are necessarily more or less complex; indeed, often so much so that experience alone can give an idea of the variety of ways they may operate. And in this particular case the question becomes to every thinking person one of more than ordinary complexity. We grope here, there, and everywhere for a precedent, and find none. We feel assured that the land originally was the property of the people, still the assurance does not justify us to take practical steps to re-establish a similar order, for from what can be inferred from the state of matters under that primitive régime such a course would not commend itself. But apart from this, there are certain indications of Socialism which permeate the Henry George doctrine. Instead of it being an accumulative power, it is a dispersive one. Wealth, effort, and energy, instead of being conserved into consolidated power, are divided into individual enterprise. The age for individual enterprise has given way to one of combined action, just the very reverse of individual action. "Owner and Tenant" may think my anticipations unnecessarily gloomy, and perhaps groundless, and may say, with plausible reason, that as the scheme has not been tried the result can only be conjectural at least. Precisely so, but the straw tends to show the direction of the current.

Again, and apart from the cumbersome and impracticable nature of the regulation of the machinery connected with nationalisation of the land, there are various other productive laws which make their force felt under special circumstances like those under consideration. Multiplication of effort in the production of foodstuffs would naturally increase produce, but would not necessarily increase the wealth of the producer. On the contrary, the tendency would be towards a diminishing of his wealth. Of course, it is open for argument that the land might be utilised in a variety of ways for the requirements of the market, and that should one article not pay another might be successful. But this form of dodging adversity could not be permanent in face of a powerful external and internal competition. Demand might be great, but production would necessarily be much greater, with the result that it would cease to be any longer a source of remuneration for effort. It is obvious that did the land belong to all, it would be of no value to any.

The uncongenial nature of our climate is in itself serious enough to guard against any rash and extensive sub-division of land; but it must be a small matter in comparison to the many other injurious effects such a scheme would create in the harmony of an incomparable commerce such as is our privilege to possess. It must be remembered that we need more than food. We want to sell our mineral and manufactured productions. Allowing that it were possible for the home producer to supply the food requirements of the nation, the equivalent in industrial products would not suffice to make our arts and manufactures paying concerns. Certainly there are our luxuries to be negotiated for in the foreign market, and would give an inducement to export trade. But many of our luxuries are taxed so many times above their value that, necessary as they are, the difference would be sufficient to paralyse our export trade. Other nations would wipe us out of the market. The prosperity of our island home is entirely due to the

capacity of its people for shopping abroad. It is unnecessary to refer to the talent and tact used in this important accomplishment; but it goes without saying that any legislation brought in conflict with this is extremely unwise, and seriously interferes with the wealth of the nation and the welfare of its people.—D. C.

### Weather Records and Garden Crops.

The interesting notes by "W. S." on page 29 of the *Journal of Horticulture*, afford an excellent indication of the advantage secured by gardeners who take careful observations of the weather, and who record them in a form convenient for reference. Such records are of value for the workers' guidance, and are occasionally useful as evidence when the demands upon supplies become unreasonable or out of proportion to the opportunities of the season. The delay in the supplies of early vegetables, or the total or partial failure of a crop, may often be traceable to weather influences at a critical period, and when memory only is relied upon it is difficult to fix these matters with certainty; while, if one wished to convince another person, it is still more unsatisfactory. It is sometimes said that with all our weather records we are only wise after the event, and though we may know that a particular frost has destroyed all fruit tree blossom, and checked or injured special vegetable crops, yet the same thing may occur another season as unexpectedly, and we have no means of prevention. This is obviously true as far as it goes. Gardeners and farmers are largely dependent upon favourable weather to enable them to secure the best results, and in an uncertain climate like this the most experienced and skilful practitioners are liable to suffer heavy losses from causes entirely out of their control. Usually, however, a resourceful man has a distinct advantage in being able to judge the probable extent of a present or impending disaster. If one crop is likely to be a failure, the sooner this is recognised the better, so that some provision may be made quickly for further supplies either of the same kind or of a suitable substitute. Amongst vegetables this is more easily managed than with outdoor fruits, for if the latter fail there is nothing to take their places. But even amongst these, valuable lessons can be learnt from the accurate observation of weather effects. In one respect alone it is important, for there is considerable difference in the hardiness of varieties, and when some of these have been proved to escape, or at least to be less damaged than others, the cultivator wisely extends his stock of them, and reduces that of the less reliable.

In another respect a chronicle of the weather variations may prove most useful to the worker, and that is in making some provision against coming evils in the shape of fungoid diseases and insect attacks. It is abundantly proved that alternations of extreme temperatures when trees or plants are commencing growth, and the young foliage is in its most tender condition, are invariably followed by excessive attacks of fungoid pests. The check given to the leaves also renders them more liable to insect attacks. In both cases a thorough and immediate course of spraying will do much to reduce the damage, though it may not avert the danger entirely. There is considerable truth, however, in the old saying, "To be forewarned is to be forearmed," and for that reason weather records may assist gardeners, though they cannot enable them to overcome all their difficulties.

The observations which are of the most importance in a garden are the rainfall, the maximum day temperature, as shown by thermometers in the shade and exposed to the sun, the minimum night temperature 3ft. or 4ft. above the ground and on the ground, and the soil temperature at 6in. to 7in. below the surface. To this should be added the barometer readings, and the direction of the wind. It is the extreme temperatures that we are most concerned with in judging the effects on vegetation, and for all ordinary purposes one observation each day will suffice for a garden record. The prevailing weather should be recorded also, especially with regard to the duration of sunshine and air movements. At the end of each week the results should be summarised, and the actual or probable effects on crops reviewed, while, subsequently, when the evils are fully apparent, reference should be made to the date when the observation was taken.

Many have proved the advantage of taking such records, and have found themselves well repaid for the extra labour and attention required. There are also few employers to whom the matter is represented in the right way who will object to providing the instruments for such a purpose. It is important if the work is undertaken that it be carried out regularly and carefully, otherwise no satisfactory or reliable conclusions can be drawn from the records that would be useful in the direction indicated.—R. LEWIS CASTLE, Ridgmont, Beds.

### Fugitive Notes.

In connection with the subject of gardeners' commissions, I find on page 9 a reference by "Monitor" to the practice of a foreign firm in enclosing a slip in their catalogue. Many gardeners will be well aware of the custom of the said firm and

its identity. I cannot accept the statement that vendors in this country are being fathered with the sins of foreign competitors, and at any rate the practice is not of recent introduction, as it has been carried on by the firm in question for some time, and about a year ago the matter was noticed in "The Gardener's Chronicle" unless my memory greatly misleads. There is no doubt corruption, if discovered, will be dealt with, whether it emanates from a Continental or an English house, should the prospective Bill become law.

The interesting note on the Cardiff Castle pot-Vines brought to mind the recollection of many pleasant hours spent in the company of the late Mr. Pettigrew. At one period none knew better than the writer of his success as a grower of many things other than pot Vines. From a gardener's point of view it is extremely regrettable to learn of the probability of the fine gardens being demolished for the planting of bricks and mortar.

In the extremely useful "Notes for Exhibitors" on page 2, "H. D." gives some well-tryed information upon colouring, or "finishing," fruit. With Black Hamburgs I still adhere to the plan, taught me years ago by a very fine fruit grower, of giving air night and day, both by the top and bottom ventilators, immediately colouring commences. There can be no doubt that some growers have a tendency to withhold water at this stage, with the idea that by so doing they are hastening the ripening process. No greater fallacy could exist, for the roots of Vines are at this period most probably in a most active state. Scarcely anyone will quarrel with "H. D." in connection with his remarks on the colouring of light-coloured Grapes. There is, however, some risk attached to tying back the leaves above Muscats unless the cultivator is prepared to shade the bunches during the warmest hours of the day during extra bright hot spells.

The report of the dinner of the Gardeners' Royal Benevolent Institution tempts me to make another appeal on behalf of this splendid helper. One glance at the yearly disbursements should convince anyone of the good that is being done amongst old and indigent fellow-craftsmen. There ought at least to be a thousand gardener subscribers to the funds; if this number could be reached there would be fewer deserving applicants sent empty away than there now are each succeeding year.—PROVINCIAL.

## The "Daffodil King" on Tour.—No. 6.

(Continued from page 6.)

Our last notes were in the nature of a valedictory to North America, for Mr. Barr sailed from the Californian coast on March 24, 1899, en route for "the land of the rising sun," and spent one day at Honolulu, one on the Sandwich group of islands, lying less than half way between California and the Japanese empire. The chief attraction here, to one of horticultural propensity, are the choice tropical fruits. There the Cocoanut trees may be seen growing along by the wayside, though not in fruit in March. The museum in the chief town here stands next to the museum, Auckland, New Zealand, for its collection of South Sea Islands relics. Mr. Barr was informed by the curator that until a few years ago the natives could supply names for every plant on Honolulu; now there is scarcely one that they can give the name of. Rice fields are, of course, a prominent feature. Honolulu is a calling station, or half-way house, for ships on the way to Japan, and is a central one in the Sandwich group.

### Japan.

Arriving at Japan, the voyager presented himself at the Club Hotel, Yokohama, being the one most frequented by the British and Colonials. The Americans go to the Grand Hotel, which is a large and finer building, and, of course, more expensive; but the best hotel of all, and, perhaps, the least frequented, is the Oriental, the menu being exceptionally good, largely from the fact that a French chef "rules the roost." Mr. Barr visited the principal nurseries of Japan, and one worked by Mr. Unger may be called the European nursery of Japan, combining, however, the finest of the Japanese cultures. This nursery does a large business in distributing trees and shrubs throughout the East.

The Yokohama Nursery Co. close by had an immense stock of dwarfed shrubs and Japanese plants, of every size and all ages, one dwarfed tree being estimated to be 500 years old. The managing director's son stated that they were prepared to give the history of this tree back 400 years to any purchaser.

These two nurseries are the principal exporters of Lilies to Europe and America. Looking over their stocks of *L. longiflorum*, Mr. Barr drew attention to the necessity of discarding many of the varieties, and working up stocks of the true eximium type. And while there (as the bulb can be distinguished from the others) some 80,000 were put out for cultivation as a start, so

that within a few years the finest forms only will be offered. Of the Bermuda form of *L. longiflorum*, the supply was not equal to the demand, hence Japan was called upon to supply the deficiency, and every variety was sent. As the Lily does not grow on the mainland, collectors are sent to the different islands to gather the bulbs, and did so without discrimination. There are something like eight distinct forms, which accounts for the early importations sometimes consisting of tall, dwarf, long-funnelled, short-funnelled, or split-flowered kinds. The split flower is a fixed form; not an accidental thing. *Lilium longiflorum* multiplies with great rapidity, so that in five years which have lapsed most of the inferior sorts will have been discarded.

The great interest to the ordinary traveller in Japan are the temples, some of them of great magnificence, and all of great antiquity. It would not be worth while to fill our pages with descriptions of these, for this can be obtained in the guide books; but it may, however, be of advantage to visitors in Japan to know of, and read, Mitford's "Old Japan," and Henry Norman's "Real Japan." Having read these, says Mr. Barr, all other works on Japan are generally of second importance.

One must not forget that besides the Lilies, Japan is famous for its Iris *Kämpferi* (*laevigata*). Mr. Barr is at present in correspondence with Japan to see whether the varieties can be traced back to their start from the original *I. Kämpferi*, a flower 2in. to 3in. across, and generally of a purple colour. There are albino varieties, but the traveller was not fortunate in seeing any of them, and these have been ennobled to flowers measuring up to 15in. diameter, in all grades of "doubleing," from semi to fully double. And the improvement in these respects is being sedulously followed up by several growers. The best collection was discovered a few miles out from Tokio. The aged proprietor was a keen florist, and had his plants in fine condition, but he belonged to the old school of Japs, who had been early trained that it was dangerous for a working man to appear to possess property, hence he never got beyond the dress of an ordinary labourer, although considered to be wealthy in land and stock. The old gentleman, however, has passed to the majority since Mr. Barr visited him and his garden.

Having discussed various questions not cognate to our pages, Mr. Barr made a reference to the Japanese and their penchant for unripe fruit. The Peaches you will hear them crunching as a boy might eat a crisp Apple. Plums they pickle and use as a relish before meals, and twice Mr. Barr essayed to try these "relishes," but twice he had to reject them.

The suburbs of Tokio are full of little nurseries, which have various specialities, including the "manufactory" of dwarf trees, most of which find their way into the two nurseries already named, in Yokohama, these being the principal outlet. Flowering Plums and Cherries, however, are grown for domestic sale.

Japan cannot be called rich, and our narrator observed that the cowkeepers around Yokohama sent out their womenfolk to collect suitable grasses for the cows, as that of the districts was of an unsatisfactory character. All the butcher meat has to be brought from the opposite or west side of the country, viz., Kobe.

The veteran traveller reached the northern island (Yezo), and mentioned that in Sophoro, the capital, the palace that had been built for the Emperor was now a hotel. The botanical professor in this city most favourably impressed Mr. Barr, the former having studied three years at Harvard University, and did some original work during that period.

Nakasaki is a very ancient town, and is one of the ports of call for steamers on their way to China. While here, the visitor was most hospitably received by the priests in charge of one of the temples, and he was fortunate to secure a selection of Japanese drawings in book form, together with a few bronzes. In the northern island, Mr. Barr found *Pæonia obovata*.

### China and the Philippine Islands.

Sailing now from Nakasaki, he next reached Shanghai, in China, called also "the model settlement of the East." Its suburbs have a decidedly English aspect, mainly through the residences of Europeans lying back from the roads, and entered by carriage drives. The native town follows generally the typical Chinese plan. Still passing southwards, Hong Kong next claimed attention, and here some days were spent, particular attention being given to the botanical garden, which is directed by Mr. Chas. Ford, F.L.S., and Mr. W. J. Tutcher is curator. Mr. Ford possesses a considerable knowledge of things Chinese, and was busy at Mr. Barr's visit, surveying the newly ceded territory given to Great Britain.

Manila lies directly in the route of any passenger to the north of Queensland, and when the *persona* of this tour left Hong Kong, his next call was at this renowned chief town of the Philippine Islands. It was then full of America's citizen-soldiers, to one of whom he spoke, and discovered that the soldier had once been in the forces of Her Britannic Majesty. Manila is an old Spanish town with nothing specially remarkable about it, except that from here the Manila hemp is shipped; so the sojourn was soon terminated, and touching next at Port Darwin, he set foot on the great Australian Continent, and his future wanderings thereon we shall take occasion to notice.

## Liverpool Parks Inspection.

One of those interesting and pleasant functions in connection with the Parks and Gardens Committee, viz., the inspection of the public parks and recreation grounds, was held on the 30th ult., when the Lord Mayor (W. W. Rutherford, Esq., M.P.), accompanied by Alderman Grindley, Roberts, Ball, Ellison, Dr. Clarke; Councillors Grant, Pickthall, Light, E. L. Lloyd, J. H. Farmer, J. Glover, T. May Smith; town clerk, M. E. R. Pickmere; Mr. H. Herbert (chief superintendent of parks), Mr. J. Guttridge (curator Wavertree Botanical Gardens), and Mr. G. W. Coltman (surveyor's department), made a start from the Prince's Boulevard, with its splendid avenues of trees, to Sefton Park. Proceeding by the vicinity of Lark Lane, the site for two new bowling greens was inspected, and in such a populous district will be most acceptable. On through the beautifully wooded park, which now is perfect to a degree, the magnificent Palm house was visited, Mr. Herbert having it just a blaze of floral beauty, intermingled with stately foliage and creeping plants. The committee noted with satisfaction the completion of the handsome statues presented by Mr. Yates Thompson. From thence to the newly incorporated Garston, where, amidst evident signs of increasing prosperity, the committee have wisely set apart thirty-five acres in the most central part, and are losing no time in beautifying it, a fine bandstand and bowling greens being rapidly constructed.

There was a short halt at the Wavertree Recreation Ground, the party then making for the Wavertree Botanical Gardens, which is one of the sights in the centre of the city. The exhibition house is a picture of high class culture, graceful Fuchsias occupying the centre stage, and brilliant Gloxinias and double and single Begonias the side stages. Many huge Palms are flowering, whilst the many species of botanical and medicinal plants are in the rudest health. Outside the beds are all planted; the carpet bedding, which a few years ago would not have been dreamt of, flourishes under Mr. Guttridge's sound culture.

Newsham Park was the next call. There the huge stretches of bedding out were fully admired, as was the new aviary recently presented by Councillor J. R. Grant, and which has taken a firm hold on the public. In Stanley Park two fine bowling greens are just completed, and will afford intense delight to the huge population close at hand. Kirkdale Recreation Ground, a large tract of land recently secured, is assuming definite proportions, and is already very popular. A flying visit was paid to other open spaces, all of which betokened the highest state of efficiency on the part of Mr. Herbert, the courteous superintendent and his staff. At the luncheon the speeches were hopeful to a degree, and signs were not wanting of the determination of the committee to keep Liverpool to the forefront in this great work to benefit its busy toilers. In concluding, I may mention that ten years ago there were twenty-two open spaces, whereas now there are fifty-three, with an aggregate of 850 acres; also that the window boxes chiefly given to the poor would (if placed end to end) cover considerably over a mile in length.—R. P. R.

## Brown Rot of Fruit.

(*SCLEROTINIA FRUCTIGENA*, Schröter.)

This is undoubtedly one of the most general, and also the most destructive of diseases against which the fruit grower has to contend. It attacks Apples, Pears, Plums, Cherries, Peaches, and is also not uncommon on various wild fruits belonging to the order Rosaceæ, as Bullace, Crab, &c.

To the ordinary observer this disease first attracts attention when it appears on the fruit under the form of brownish scattered patches on the skin. This is followed by the growth of dull grey tufts (the so-called *Monilia* fungus), which are usually arranged in irregular concentric rings. These grey tufts are composed of dense masses of spores arranged in long branched chains. The fairy-ring arrangement of the fungus is most evident on Apples and Pears; on Plums, Cherries, and stone fruit generally the grey tufts are irregularly scattered over the surface. Although most obvious on the fruit, the fungus usually first attacks the leaves, where it forms thin, velvety, olive-green patches. The spores from diseased leaves are washed by rain, or carried by insects, on to the surface of the young fruit, or not infrequently the flowers are also inoculated from spores derived from young leaves; and in many instances where brown and shrivelled blossoms are attributed to the action of a late frost, the true cause is in reality due to the *Monilia* fungus.

In those instances where the disease has been allowed to follow its course undisturbed for some years, the young shoots of the trees are also attacked and killed during the first or second year. The fungus develops rapidly on such dead twigs, and furnishes a ready supply of spores, which are mature during

Explanation of the Figures.

1. A diseased hoot with the persistent blossom of the previous year; cut from the tree in February. Both twig and flower-stalks bear tufts of the fungus. Nat. size.
2. Cherry leaf attacked by the fungus. Nat. size.
3. An Apple recently attacked, and showing the fungus growing in concentric rings. Nat. size.
4. Fresh Cherry blossom attacked by the fungus. Nat. size.

April and May, just when the young leaves and blossom are most susceptible, and wholesale infection results.

Fruit attacked by this disease does not rot and decay, but becomes dry and mummified. Such fruit often remains hanging on the tree until the following season. Whether it does so or falls to the ground, it is practically unchanged until the following spring, when its entire surface becomes covered with a copious crop of spores, which are dispersed by various agencies, and the disease repeats itself.

It has long been suspected that the *Monilia* represented but one stage in the life-cycle of the fungus; this supposition has proved to be correct, the second or ascigerous form of fruit having been found growing abundantly on old half-buried Peaches in several orchards in different parts of the United States, where the fungus proves quite as destructive as with us.

### PREVENTIVE MEASURES.

All dead twigs and shrivelled fruit, whether hanging on the tree or lying on the ground, should be collected and burned during the winter.

After the diseased fruit and dead branches have been removed, the trees and also the ground should be thoroughly drenched with a solution of sulphate of iron, prepared as follows:

Sulphate of iron .. .. .	25 pounds.
Sulphuric acid .. .. .	1 pint.
Water .. .. .	50 gallons.

Pour the sulphuric acid upon the sulphate of iron, then add the fifty gallons of water by degrees. A barrel is the best vessel to use; a metal vessel must not be used, as it would be acted upon by the sulphuric acid. Spraying with the above solution should be done in January or February, before the leaf-buds begin to swell in the least, otherwise the foliage and blossom will be destroyed. When the leaf-buds are expanding, and at intervals as required, the trees should be sprayed with quite weak Bordeaux mixture. The above line of treatment must be followed for at least two seasons.

Copies of the above in leaflet form may be obtained free of charge and post free on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

# NOTES & NOTICES

## Richmond Show—Correction.

Messrs. B. R. Cant and Sons, of the Old Rose Gardens, Colchester, draw attention to the fact that they were the winners of the twenty-five guinea cup for Roses at Richmond Show, which honour our contributor recorded in favour of another firm.

## Appointment.

Mr. Joseph Mottram, for the past fourteen years head gardener to Mrs. Boden, Beach Mount, Bowdon, Cheshire, has been appointed head gardener to Abel Buckley, Esq., Ryecroft Hall, Audenshaw, near Manchester. Mr. Mottram takes charge of Ryecroft Hall Gardens on Saturday, July 25.

## Royal Horticultural Society.

The next meeting of the Royal Horticultural Society will be held at the Drill Hall, Buckingham Gate, Westminster, on Tuesday, July 21, from 1 to 6 p.m. In connection with this meeting the National Carnation and Picotee Society will hold its annual show. Instead of the subject previously announced, the lecture will be on "Horticulture in and the Flora of New Zealand," by G. Hunt, Esq.

## A Notable Achievement.

In perusing the numerous show reports, it may have escaped the notice of our readers that there is one firm which this season has won three gold medals within a month. That firm is Messrs. Dicksons, of Chester, to whom was awarded a gold medal at each of the following shows, viz.: the York Gala, the Hanley Fête on the 1st and 2nd inst., and the Wolverhampton Fête upon the 7th, 8th, and 9th of this month.

## Lincolnshire Bulbs for Holland.

Dutch bulb buyers have been making extensive purchases of bulbs in the Spalding district, and these will shortly be consigned to Holland by water, being loaded up on the river Welland at Spalding. Dutch bulbs have suffered severely through the frost, and hence the purchase of Lincolnshire bulbs to take their place. It is a curious fact that the particular district where the bulbs have been purchased is known as Holland Division of Lincolnshire.

## Arrangement of Rhododendrons.

The picture on page 61 illustrates an effective arrangement of Azaleas and Rhododendrons, for Azaleas will always be regarded by gardeners as distinct from Rhododendrons. Both Azaleas and Rhododendrons are wonderfully accommodating in soils other than calcareous ones, and they succeed in all moderately open positions. They are seen to advantage in large masses and groups near each other or in continuous borders. Sloping dells and banks show them off to advantage, and Lilies, Foxgloves, and Mulleins sometimes form a good complement with the shrubs. For the sake of their beautiful autumn foliage the Azaleas should be liberally planted.

## City Horticulture at Edinburgh.

Mr. J. W. M'Hattie, City Gardener, delivered an address on "The Cultivation of Window Plants" on July 10 at the loan exhibition of flowers which is being held at 90, Fountainbridge, Edinburgh, to a large audience. Mr. M'Hattie pointed out that only those who had a love of flowers in their hearts could be expected to give them all those little attentions, tender and constant, that went so far to make up the sum of success in plant culture. To carefully tend a plant for the space of two or three months for the sake of winning a prize was a low and sordid motive. That exhibition was intended to waken and keep alive within the people of that district a true, gentle, and lasting love for flowers that would lead them to take the flowers to their hearts. Mr. J. M. Hogge, in moving a vote of thanks to Mr. M'Hattie, suggested that Corporation should, as was done in Glasgow, supply window boxes to the people in the poorer parts of the city.

## Manchester Botanic Gardens.

We learn that the Stretford Urban Council have acquired, or will acquire, these gardens, in order to preserve them to the Manchester public.

## Croydon Gardeners' Society.

An excellent syllabus of meetings up to December 15 has been arranged, and copies are in the hands of Mr. Harry Boshier, 62, High Street, Croydon, who is secretary.

## The Codlin Moth.

We are informed that Mr. W. Horne, of the firm of Horne and Sons, Cliffe, has found a remedy for stopping the ravages of the codlin moth, and proposes making it known to the public by reading a paper on the subject at the September meeting of the National Fruit Growers' Federation.

## £25 for the Gardeners' Orphan Fund.

Mr. Abraham Follett Osler, F.R.S., of South Bank, Edgbaston, who lately died, left £25 to the Royal Gardeners' Orphan Fund, and £25 to the Birmingham Gardeners' Mutual Improvement Society. Mr. Osler also some few years ago presented the Birmingham Gardeners' Mutual Improvement Society with twelve new volumes of "Sowerby's British Botany."

## United Horticultural Benefit and Provident Society.

The usual monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, on Monday evening last, Mr. Thomas Winter in the chair. Four new members were elected, making sixty-one this year, the total membership now being 1,026. Five members were reported on the sick fund. The sick list has been unusually heavy during the last half year.

## American Friends in England.

A large number of American visitors are at present in London, and among them not a few who are well known to botany and horticulture. We have seen Professor Sargent, Professor Waugh, and Mr. R. Vincent, jun., the latter being the largest vegetable and plant grower in the United States. He is, moreover, a Rugby (Eng.) man. In such an extensive country as the U.S. there are always failures of certain crops somewhere, and it is the purpose of Messrs. Vincent and Sons to be able to supply vegetable stocks whenever called upon.

## Edinburgh Seed Trade.

On the evening of Wednesday, the 8th inst., a most interesting ceremony took place in the Royal British Hotel, when a representative gathering of gentlemen connected with the seed, flower, and market garden trades was held in honour of Mr. Alexander Selater, the well-known seed manager to Messrs. Thomas Methven and Sons, on the occasion of his silver wedding. The gathering was presided over by the gentle and genial Mr. Henry Erskine in a manner so pleasant that everybody felt the meeting a most enjoyable one. The members of the Edinburgh seed trade are the keenest of keen business men, but when they lay aside the tomahawk and fraternise, they are full of brotherly affection—the sharpest opponents being the first to recognise the good qualities of a brother in trade. As mouthpiece of the meeting, Mr. William Newton, fruit salesman, presented Mr. Selater, in the name of many friends present and absent, with a solid silver tea and coffee service, and in felicitous terms eulogised Mr. Selater's many outstanding virtues—his energy in business, his urbanity, his probity, and above all his willingness at all times to assist younger and less experienced brethren from his great store of knowledge. No one was better known in Edinburgh markets than Mr. Selater, and it was universally felt that the longer and better he was known the more he was esteemed. Mr. Selater replied in a terse and interesting speech, thanking his friends for their great and unlooked-for kindness, and giving many interesting reminiscences of the Edinburgh seed trade during the more than thirty years he had been connected with it. To mix among the market gardeners and gardeners of the East of Scotland for that long period, and to find that he had not only no enemies, but troops of friends, was a matter of which he was very proud, and in his own name, and that of his partner in life, he was deeply grateful for the very bounteous expression of their goodwill and good wishes. A very pleasant evening of song and sentiment was spent.

**French Black Currants.**

A record cargo of French Black Currants, consisting of 11,700 packages, has arrived at Hull. The fruit was of excellent quality, and made good prices, some buyers taking as much as fifty tons.

**Pioneer of the Scottish Fruit Trade Dead.**

An old and prominent merchant in Edinburgh has been removed by the death of Mr. James Lindsay, of Drydenbank, Loanhead, the head of the firm of James Lindsay and Son, Ltd., fruit salesmen, Edinburgh and Glasgow. Born in Dundee on May 17, 1815, a month before the battle of Waterloo, he had thus entered his eighty-ninth year. Mr. Lindsay was the first wholesale fruit merchant to make a start with that now extensive trade in Scotland.

**Fruit Crop in North-west Fife.**

The much-longed-for rains which have fallen have had a very beneficial effect upon the fruit crops in the north-western district of Fifeshire. Strawberries have recovered their stunted growth, caused by the prolonged drought, and the early crop will be a fair one. Picking is general. In some districts the fruit was selling at from 10d. to 1s. 1d. per pint. Gooseberries are showing best on young plants, and owing to the failure of the English and some of the Scottish fruit crops, are commanding good prices, 2d. per lb.; and 1½d. per lb for wholesale quantities of green berries. Raspberries show only an average return, and Currants, with the exception of the Black, are abundant.

**The Fruit Supply.**

The general shortage in English-grown fruit this year, says the "Daily Express," has been compensated by some remarkable increases in imported fruit. The public, therefore, is scarcely feeling the losses which have caused depression among fruit-farmers. The following table shows the increases in the consignments of some of the most popular fruits:—

Fruits.	Increase during June, 1903.	Increase during half-year.
Bananas .....	118,152 bunches	250,535 bunches
Apples .....	5,376 cwts	564,887 cwts
Currants .....	2,438 cwts	2,438 cwts
Gooseberries .....	3,435 cwts	3,846 cwts
Pears .....	550 cwts	6,391 cwts
Strawberries .....	3,673 cwts	3,695 cwts

One of the poorest crops this year is that of Black Currants. Frosts, rainstorms, bitter winds, and jumping temperatures are greatly to blame, but the devastations of the mite have been serious in most plantations. It is, therefore, not surprising that the fruit is being sold at Covent Garden at 1s. a lb. Bad reports come from all orchards, even from the best and most sheltered orchards of the West of England. Cherries, Pears, and Plums have suffered the greatest destruction. A decrease of 16,175 cwts. in imported Cherries during the period ended June 30 shows that Continental growers have also suffered misfortune. Cherries are likely to remain dear throughout the season, as nearly the whole of the Kent crops are a failure.

**The Apple Crop.**

A correspondent writes to "The Maidstone Gazette" as follows:—"Time is now sufficiently advanced for the crop to be fairly estimated. A light one, limited to a few sorts, is all that has been expected for some time, but the situation every day becomes worse throughout the land, so much so that I believe we shall have one of the smallest crops on record. In fact, the crop can be called nothing short of an utter failure. Orchard after orchard may be found with scarcely enough fruit to pay for picking, and what few Apples are left have yet serious attacks of vermin to face. The chief cause of the present state of things was probably the severe late frosts, but I do not think this can hardly account for the whole. Certain sorts are very conspicuous as having pulled through, chiefly the Worcester Pearmain, the old-fashioned King Pippin, Cox's Orange, and the Blenheim Orange. On the other hand, some sorts, go where you will, will yield practically nothing, the Wellington being conspicuous in this way. Our forefathers grew Apples anyhow, but it is certain now we must devote a considerable amount of attention to them, or they will be a thing of the past—I mean as to protection from vermin and the like. But the reverse should be, for we are living in the day when some grand new plantations are coming in, and the Apple crop of Kent should be very much in advance of anything grown in former years."

**Register of Nurseries, &c.**

We have again received Messrs. Protheroe and Morris's quarterly register of nurseries, market gardens, farms, florists' seed businesses, and partnerships, to be let or sold. Application for this register should be made to the firm at 67, Cheapside, London.

**Pea Pickers.**

Down in Kent, in the district which may be sufficiently well described as lying between Sandwich, Canterbury, and Dover, green Pea picking is in full swing (writes a correspondent). Many acres of the best sorts are now grown for the local preserving factories, which have a large and increasing output, and afford work to many in the process of canning and bottling. Those who do the actual picking in the fields appear regularly, year by year, no one can tell you from whence, and after the last field is finished they vanish for another year. A motley lot of humanity they appear as they toil along the dusty highways on their journeys from one scene of labour to the next. Some possess ponies and carts, on which their household effects are piled high, the top of the load being generally occupied by swarms of bareheaded children; but the majority trundle their sorry equipment along on shaky perambulators or go-carts made of sugar-boxes mounted on wheels. Picking begins soon after day-break, and continues, with a short rest at noon, until evening, and then the pickers, men, women, and children, begin to prepare for supper, and put up rough shelters made by hurdles covered over with the Pea straw, although many carry light poles, both ends being stuck in the ground, and canvas laid over them. Next ensues a procession to the nearest town or village in search of supplies. Your true-bred picker does not believe in stinting himself to-day in order to provide for the morrow. The village greaser does a fine trade, the baker quickly sells out his stock, and truth compels me to admit that the alehouse is not neglected. As the long July evening passes into the twilight of the summer night, the camp fires glow red, and the pleasant and pungent odour of burning wood fills the air. The youngsters, merry as crickets, despite their rags, indulge in merry games, until presently, tired out with their long day in the hot sun, they creep into their various apologies for beds, and silence gradually falls upon the pea-pickers' camp.—"Pall Mall Gazette."

**Fruit in Herefordshire.**

All the farm crops in Herefordshire and adjoining counties are backward by quite a fortnight, having been checked by cold winds and frosts in May and June, but, excepting orchard fruit, which is the worst failure during twenty years, they promise a fairly satisfactory yield. Last year's orchard fruit crop was bad enough, says "The Hereford Times," spoiled as it was by a plague of weevils, midges, and other insect pests. This year, it seemed in May as if both pot and vintage fruit had gone entirely. The cause is attributed by some people entirely to the extraordinary frosts of May, which killed the blossoms, but we should also remember that after the trees were cut so badly by blight twelve months ago they made a second growth rather freely, which tended to check the wood from ripening and producing fruit this time. As a consequence, the blossoms did not open this spring so freely as they should have done, and thus they proved an easier victim to the frost. Mr. John Watkins, of Pomona Farm, Withington, was showing some fruit growers the other day, two branches from a Cherry tree, still bearing the withered blossoms, and two or three feet length of the wood itself killed by the frost. The whole of his Cherry plantation had suffered in like manner. Early Apples, Pears, Plums, Cherries, and other tree fruit all suffered, the frost destroying the pollen, so that the fruit never set. Terrific hailstorms in some parts of the county completed the work of destruction which had been effected already to a great extent by the frost and blight. It is only on cultivated ground that there is any pot fruit left. Most of the early sorts of pot and cider fruit have vanished along with the Plums. Late cider varieties are just making an appearance, but they are only in a few places anything like a crop. The best sprinkling of Apples is at Tillington Nurseries, which lie in a sheltered position. Cherries are practically a failure, and the blackbirds are making fierce attacks on those that are left. Many Plum trees that have been washed are "blowing" again, and may produce a second and better crop. The Damson trees are pitiful to look at, showing practically no fruit and being covered with aphids. Nuts are scarce. Strawberries are not a big crop.

### Seasonable Notes.

The final potting is in many cases not carried out until well into the present month, but good, if not the best results, often follow late potting. Where there are large numbers of plants it is often difficult to get them all potted as early as desirable. A good stock of compost should be kept in readiness, so that every favourable opportunity may be taken advantage of to pot a few plants. The best mixture is composed of four parts loam of a turfy character, one part leaf soil, one of sweetened horse droppings, half a part of old mortar broken up finely, together with some coarse sand and wood ashes and a 6in potful of bonemeal intermixed with each bushel of compost. Turn the whole over several times, and ensure it being in a properly moist condition for potting. Do not allow it to lie to the drying influence of the air in hot weather, but cover with mats. The pots may be prepared in readiness at odd times, crocking them moderately, covering the drainage with damp moss, flaky manure, or rough parts of the potting material.

It is essential that the plants be thoroughly moist when turned out of their pots for placing in larger. With late potting the roots will be found to be very much matted round the sides of pots. These must be loosened a little, and the crocks at the base removed; 8in or 9in pots are the most suitable size to place single plants in. Fill in some of the compost, which press down firmly, then arrange the plant so that the ball is well below the surface, and work in material firmly round, finishing by just covering the ball and leaving some space for top-dressing later on. If turned out from pots larger than 5in, correspondingly larger pots must be used for the final potting.

Stake the plants immediately, those with tall stems requiring support. Water need not be immediately supplied to the roots, but a light syringing may be given daily, and a copious watering as soon as the moisture in the soil appears to be lessening. In very dry weather this will require to be done in a few days. In damp weather perhaps not for a week. Stand the plants in an open position on boards, or on an ash bed.

The top of the sticks supporting single stemmed plants should be secured to a horizontal wire stretched between upright stakes. As the plants grow tie in the main stem to the sticks and rub out all side growths. With proper attention to syringing and watering the growths should be free of insects. Watering is, of course, an important operation, and on its proper carrying out depends to a great extent the health of the plants. Water must be given, when it is required, in quantity sufficient to pass through the whole mass of soil and roots. Then wait until the same conditions prevail again. This may happen twice daily in very hot weather, or several days may elapse. Much depends on the vigour of the variety, and the quickness with which the pot is filled with roots. Clear, soft water should be the only stimulant applied until there are plenty of roots, and the buds appear.

Syringing the plants at intervals is beneficial, especially after hot days and in dusty weather. It will freshen up the growth well, but the ordinary watering should be done first.

Plants that may have been potted early and have since made abundant growth, in some cases becoming very much root-bound, and needing some further support, may have it by applying weak liquid manure or soot water once or twice weekly. A top-dressing, too, may be applied, this consisting of loam mixed with a little bonemeal and rotted cow manure. This will largely invigorate the plants and induce the production of fibrous rootlets.

Should insects appear at the points of shoots dust with tobacco powder. Remove weeds from soil, and any dead leaves which may be on the plants. It is always desirable to water the plants with water that has become warmed by the sun, exposure to the air also helping to render it soft. Hard water may, however, be materially softened by dissolving washing soda in it, half a pound being sufficient to soften 80gals of water. It is necessary to dissolve the soda in boiling water first, then mix it in the water, allowing it a day to settle before using. There is also a preparation called anti-calcaire, which is very useful to soften hard chalky water. It is a good plan to catch all the soft water possible in casks and tanks for use in Chrysanthemum culture.—E. D. S.

### Cardiff Gardeners' Outing to "The Hendre."

Mr. John Julian, as secretary of the Cardiff Gardeners' Society, has just sent us the programme for the annual summer outing, which will take place on Monday, August 10, to Lord Llangattoek's beautiful gardens. The party will leave at 9.20 in the morning, and start on the return journey at 8.45 p.m.

## Societies.

### R.H.S., Scientific Committee, July 7th.

Present: Dr. M. C. Cooke (in the chair); Messrs. Holmes, Gordon, Massee, and Saunders, Prof. Boulger, Revs. W. Wilks and G. Henslow (hon. sec.).

*Apple trees and insects.*—Mr. Saunders reports as follows upon specimens received from Mr. Campbell, of Ardross, Leeds: "The Apple trees are attacked by the caterpillars of two different moths, but the habits of both kinds are very similar. The green caterpillars are those of the winter moth (*Cheimatobia brumata*), the brown and yellow ones of the great winter moth (*Hybernia defoliaria*); both belong to the family Geometridæ, and are two of the most destructive pests to Apple trees. The females of both kinds are wingless, or have only the rudiments of wings, so that they are incapable of flight. As the chrysalides are formed in the ground when the moths emerge, it is evident that they must climb up the trees if they wish to lay their eggs, as is their custom, near the buds. To prevent this is one of the most important things, if it is desired to protect the trees from attacks by the caterpillars. The simplest way of effecting this is to fasten greasy bands round the stems, which the caterpillars are unable to cross. As this might injure the tree if the grease came in contact with it, a strip of grease-proof paper, 7 or 8in wide, and long enough to overlap an inch or more, should be tied round the trees, say 3ft from the ground, and fastened top and bottom with bast matting or soft string that will not cut the paper. Over this should be tied a strip of calico about the same width, also tied top and bottom; this must be well smeared with eart-grease, softsoap, and train-oil mixed, so that a soft, sticky compound is formed in which the moths will be caught. These bands should be put into position as early as the middle of October, and kept in working order until well after Christmas. To do this the bands should be re-greased every now and then, or whenever it is found that the grease is losing its stickiness, or, as is sometimes the case, clogged up with the number of moths caught in it. Notwithstanding these precautions, some of the females may find their way into the young shoots. Some are no doubt carried by the males (who fly well) when coupled, so that it is useful, when it can be carried out, to spray the trees before the buds show any signs of opening with a caustic alkali wash, made by dissolving 1lb of caustic soda in half a bucket of water, add  $\frac{1}{2}$ lb of pearlash, and stir until all is dissolved, then add enough soft water to make 10 gallons, and finally stir in 10oz of softsoap which has been melted in a little hot water. This mixture is very caustic, and must not be allowed to touch the skin or clothes, and if it does it should be wiped off as soon as possible. A still day should be chosen, so that the wind will not blow it on to the operators; this spraying should kill the eggs if any are laid on the tree. To destroy the caterpillars the trees should be sprayed as soon as the fruit has set with paraffin emulsion, or  $\frac{1}{4}$ lb of Paris green and  $\frac{1}{2}$ lb of lime mixed in 50 gallons of water. This mixture must be kept well stirred, as the Paris green is very heavy and soon sinks to the bottom, and in this case some of the mixture will be too weak to kill the caterpillars, and the rest so strong that the foliage will be injured."

*Lilac shoots and frost.*—Mr. Massee showed a curious and important effect of frost on the leaves of the Lilac. The apex was frost-bitten, then, after a thaw, the leaf became attacked by *Botrytis cinerea*, which travelled down the region of the midrib and petiole, till it attacked the terminal bud between the leaves. As thousands of flower buds were thus destroyed in consequence of the late frost, such represented great pecuniary loss to the growers for the flower markets.

### Diss, July 7th.

A strong and gusty northerly gale raged over the eastern counties on Tuesday, the day before this little show; in not a few cases the flower heads were actually blown off, and no doubt many maidens were blown out. Still, the morning was very cool and rather dull, setting up was a pleasure, and Roses looked and stood well.

In the open class for thirty-six, Rev. A. Foster-Melliar was pretty easily first with good Ulrich Brunner and Golden Gate, a small but nice Mildred Grant, and Mrs. Robert Garrett, a H.T. that comes balled in cool weather, but under the influence of the last few hot days has shown fine exhibition qualities, and is at all times a capital grower. Frank Cant was second with a somewhat poor lot, Mildred Grant, Ulster, and Innocente Pirola being his best. Rev. J. R. Fellowes was third. For the Frere challenge cup (amateurs, twenty-four), Mr. Foster-Melliar was easily first with a fine and substantial stand. The following were especially good: Mildred Grant (best H.P. or H.T.), Lady Moyra Beaulere, Ulrich Brunner, Mamie, and Maman Cochet (best T. or N.). Mr. Fellowes was second with Madame Cusin, a small Frau Karl Druschki, and Anna Olivier as his best. Rev. H. A. Berners was third.

In the class for twelve Teas (open), Mr. Foster-Melliar was again pretty easily first, with large blooms, of which Cleopatra, Maman Cochet, White Maman Cochet, and Muriel Grahame were perhaps the best. Mr. Berners was second, having fair blooms of

Madame Cusin, Jean Ducher, and White Maman Cochet. Frank Cant was third, having Mrs. Mawley and Sylph as fair flowers.

The local classes, which would be only of local interest, were fairly filled. Nowhere else but at Diss do I find that excellent arrangement of staging, suggested, I believe, by Rev. Page Roberts, which consists in a sort of gangway formed by a couple of planks running down the centre of the staging table, and lifted 4in or 5in above it. All the Rose boxes, when finally staged have their backs just resting on these planks, a plan which has the following advantages: the boxes are all set up at the same angle, which is a great convenience to the judges; exhibitors do not need to bother with blocks or flower pots, &c.; and spectators do not brush against the blooms or find themselves pushed against them too close for a good view.—W. R. RAILLEM.

### Wolverhampton Gala, July 7th, 8th, and 9th.

Owing to the effects of the high wind which prevailed all day on the 6th, fears were entertained that the show would have to be postponed on the following day, as one or two of the large tents completely collapsed. The judging was delayed, and the groups of plants were not in readiness till late in the afternoon. Nevertheless, there was an immense attendance of visitors. We must acknowledge here the capabilities and exertions of the energetic and courteous secretary, Mr. W. E. Barnett, and his colleagues in having so efficiently rehabilitated the damaged structures.

This was one of the best shows yet held by the society, a leading feature being the vast array of hardy flowers. Rivalling the foregoing was the show of Roses, which was of a most gratifying character. There was a more than usually numerous complement of forced fruits, all of high quality, excepting the unripeness of the Muscat of Alexandria Grapes. Another attractive feature was Orchid groups, the best, on the whole, yet seen here, and which attracted a continuous crowd of visitors. There were two collections staged, each in a space 12ft by 5ft, and the premier winners, Messrs. J. Cypher and Sons, Cheltenham, were closely contested by Mr. J. Robson, of Altrincham. Mention must also be made of the hand bouquets, baskets, and wild flowers by amateurs and cottagers, ladies and children.

#### Plants: Open Classes.

For the group of plants arranged for effect there were but three contestants, and, as formerly, Messrs. James Cypher and Sons, of Cheltenham, were the recipients of first honours, with a departure materially different to the cork-bark bridges, temples, &c., that of recent years characterised their groups. Instead, they simply erected a pyramidal shaped centrepiece of plants, surmounted by a large and massive Palm, in a space not to exceed three hundred and fifty square feet. In the estimation of many, it afforded a pleasing and welcome change. The second prize was awarded to a new comer, Messrs. Artindale, of Sheffield, who proved to be a worthy contestant; and the third position was credited to Mr. J. Vause, Leamington.

Considerable interest was taken in the new class for groups, namely: (1) A display of plants or floral arrangements, or both combined; (2) fruit or vegetables, or both permitted, staged in a space not to exceed two hundred square feet. First prize, a silver cup, value £5 5s., and cash £20; second prize, £10; third, £5. It brought forth three contestants, and their exhibits each occupied 40ft by 5ft of tabling. The judges were evidently considerably exercised in coming to a decision, but eventually awarded the coveted blue ribbon to Mr. J. E. Knight, nurseryman, Wolverhampton, with an effective combination of masses of Lilv of the Valley in pots as one of the principal features, also with a Lilium Harrisii and auratum, Ivy-leaf Pelargonium, and various other subjects, with a backing of Bamboo, and an elegantly arranged fringe of drooping plants overhanging the green baize stage covering. The second prize was accorded Mr. J. V. Macdonald, gardener to G. H. Kenrick, Esq., Edgbaston, Birmingham, who elected to try conclusions in this class instead of his usual contest in the original class already indicated. His wealth of Orchids, grand Codiaëums (Crotons), and other fine-foliage plants ought to have won the leading position; but having adopted his of late years system of arrangement, as in the old large grouping, it lacked effect from a point of view a few feet distant, with also a meagreness in the frontal edging. The third prize fell to Mr. George Hancock, West Bromwich, for a creditable arrangement.

For six exotic Ferns, Mr. Macdonald won the first prize with excellent large specimens; second, Mr. A. Cryer, gardener to J. A. Kenrick, Esq., Edgbaston; and third, to Mr. H. Blakeway, gardener to Sir A. Muntz, Bart., M.P., Rugby.

There was a spirited contest in the class for a collection of flowering plants in 9ft by 5ft. There were some half-dozen groups, and the first prize deservedly fell to Mr. R. Sharpe, gardener to H. Lovatt, Esq., Northampton, for a splendid assortment of Cannas, being uniformly well flowered on dwarf and healthy foliaged plants; the second prize was accorded to Mr. Robson, Altrincham, for a superb lot of Carnation Princess of Wales; and the third, to Mr. J. Dickson, gardener to S. T.

Mander, Esq., Wightwick Manor, Wolverhampton, for a fine lot of *Crassula coccinea*.

In the class for sixteen stove and greenhouse plants (Orchids excluded), the Messrs. Cypher, as usual, were to the fore with some of their huge specimens, the names of which being so familiar to the readers of the Journal it would be supererogatory to again mention them. Mr. W. Vause, Leamington, the only other exhibitor, was placed second. In the class for twelve plants (Orchids excluded), the foregoing contestants were similarly placed. For twenty plants, in pots not to exceed 8in, at least eight to be in bloom, Messrs. Cypher won the first prize.

#### Roses.

In the class for seventy-two blooms there were four competitors (first prize £20), and Messrs. R. Harkness and Co., Hitchin, distinguished themselves by securing the lead. The collections contained several fine blooms, both of the newer and older varieties. The same remarks also apply to Messrs. B. R. Cant and Sons, Colchester, who were a close second; the third prize fell to Messrs. Prior and Son, and the fourth to King's Acre Nurseries Limited, Hereford.

There were seven exhibits in the class for forty-eight blooms, Messrs. Harkness again coming off victorious with very good examples; closely followed by Mr. G. Mount, of Canterbury; whilst Ben Cant and Prior and Son were respectively third and fourth.

For eight distinct varieties, three blooms of each, there were nine entrants. Mr. G. Mount was easily first with a beautiful exhibit of Caroline Testout, Bessie Brown, Mrs. John Laing, Ulrich Brunner, Mildred Grant, and Mrs. W. J. Grant amongst his best; second, the King's Acre Nurseries, with excellent blooms of A. K. Williams, Bessie Brown, Lady Mary Fitzwilliam, Marie Baumann, Caroline Testout, K. A. Victoria, Mrs. John Laing, and Marquise Litta. The third and fourth prizes went respectively to Messrs. Harkness and Messrs. Dickson and Son, Newtownards, Belfast.

In the class for twelve bunches of Roses (first prize £5) there existed some ambiguity, inasmuch as the first prize contestant (Mr. G. Mount) had seven fine blooms of a dull red Hybrid Perpetual unnamed variety, divested of the buds, which created considerable comment, as being against the rules. Mr. G. Prince, of Farringdon, Berks, was accorded second for huge bunches of Tea and decorative Roses with the buds as cut; third, the King's Acre Nurseries, with fewer blooms.

In the class for twelve Roses, new varieties of 1900, 1901, and 1902 (first prize gold medal, value £3, and cash £2), Messrs. B. R. Cant and Sons were first with Robert Scott, Lady Moyra Beauclerc, Mildred Grant, Apothekar G. Hofer, Alice Lindsell, Gladys Harkness, Frau Peter Lambert, Frau Karl Druschki, Madame Jean Dupuy, Edmond Deshayes, and Prince de Bulgarie. The second prize fell to Messrs. A. Dickson and Sons; and third, to Messrs. Perkins and Sons, Coventry. The latter did not exhibit in any other class owing to the lateness of the season.

For twenty-four distinct varieties (for exhibitors not showing in the class of seventy-two varieties) the first prize fell to Mr. G. Mount; second Messrs. L. Townsend and Sons, Worcester; third, Mr. G. Prince, Longworth, Berks. For nine distinct varieties of T.'s and N.'s, seven blooms of each, in vases, Mr. G. Prince was placed first; second Messrs. Prior and Son; third G. Mount. In the classes for twelve blooms, one variety, there were fourteen exhibits, forming, as they collectively did, an attractive feature. For a box of light coloured Roses G. Mount led with Mildred Grant; second, Messrs. Townsend and Son, with Bessie Brown; and third, the King's Acre Nursery, with the same. For twelve blooms of Tea Roses G. Prince won the first prize; King's Acre Nursery second; and Messrs. Townsend and Son third prize. There were one or two other classes for Roses, such as bowls of blooms, Sweet Briars, &c., all more or less meritorious.

Sweet Peas were shown in excellent form both as regards quality and the arrangement generally. For an arrangement for effect, Messrs. Jones and Sons, Shrewsbury, were the only exhibitors, but well deserved the first prize. For eighteen varieties, Mr. E. Amies, Stafford, won with a capital arrangement of fine and clean blooms of the leading varieties. The second prize went to Mr. R. Piazzani, Ryton, near Sheffield; third, Messrs. Jarman and Co., Chard. Mr. Bastin was awarded an honorary prize for a collection of Sweet Peas in pots and trained to tall stakes. This system no doubt answers well for an early crop under glass, but the somewhat straggling growth does not altogether commend itself in the exhibition tent. There was a keen competition for the prizes offered by Mr. Henry Eckford and Mr. Robert Sydenham.

Pansies and Violas formed an attractive feature, and Mr. F. C. Brookes, gardener to Councillor W. Waters, Acock's Green, was awarded the first prize for a most tastefully arranged display of Violas; the second prize fell to Mr. W. Pemberton, Walsall, and the third to Messrs. Harkness and Son.

Hand bouquets were not so numerous as on some former occasions, the chief exhibitors being Messrs. Perkins, of Coventry, with examples of their most artistic combinations.

Messrs. Suckling, Leaming, and W. Jenkinson were successful contestants with dinner-table decorations, including also Mr. W. Vause. Begonias were grandly shown, the first prize being awarded to Mr. A. Cryer; second Mr. B. Sharpe; and third to Mr. T. F. Simpson, gardener to C. T. Mander, Esq., Compton, near Wolverhampton. Gloxinias were remarkably fine. A meed of praise should be awarded to the veteran Curator of the West Park for the fine collection of Caladiums, interspersed with elegant Humeas, and edged with Begonias and Ferns.

#### Fruit and Vegetables.

As already remarked, fruit was unusually well shown. For a collection of eight dishes, Pines excluded (first prize, £10). Mr. J. Doe, gardener to Lord Savile, Rufford Abbey, Notts, was, as last year, placed first with fine examples of Madresfield Court and Muscat of Alexandria Grapes, a grand dish each of highly coloured Dymond and Stirling Castle Peaches, a good dish of Improved Downton Nectarine, a fine dish of Royal Sovereign Strawberries, Brown Turkey Figs, and a large and finely netted Melon, Taunton Hero. Second, Mr. J. H. Goodacre, for three large and compact, well finished bunches of Black Hamburg and Muscat of Alexandria Grapes, good Royal George and Belle-garde Peaches, large and highly coloured Lord Napier Nectarines, Brown Turkey Figs, and a large Countess Melon. The third prize fell to Mr. T. Bannerman.

For four varieties of Grapes the first prize was awarded to Mr. S. Barker, gardener to the Duke of Newcastle, Worksop Manor, with good examples of Foster's Seedling, well finished Black Hamburgs, beautiful examples of Madresfield Court and Buckland Sweetwater. The second prize went to Mr. Bannerman, with fine Black Hamburg, Muscat of Alexandria, Madresfield Court, and Foster's Seedling. The third and fourth prizes were taken respectively by Mr. J. Doe and Mr. J. Read, gardener to the Earl of Carnarvon, Bretby Park, Burton-on-Trent. For two bunches of white Grapes Mr. S. Barker was to the fore with well ripened and fine bunches of Buckland Sweetwater; second, Mr. B. Ashton, gardener to the Earl of Lathom, Ormskirk, with the preceding same varieties; and third, Mr. Bannerman. An extra prize was awarded to Mr. H. Doe for two bunches of large berried but unripe Muscat of Alexandria.

Peaches were remarkably well shown. The first prize was awarded to Mr. J. Doe for highly coloured Dymond; second, Mr. B. Ashton, for large Hales' Early; and third, Mr. S. Barker, with Royal George. For a dish of Nectarines Mr. J. Read was first with large and highly coloured fruits of Humboldt; and second Mr. R. Nisbet, gardener to W. A. H. Bass, Esq., Burton-on-Trent, for a fine dish of Lord Napier.

Melons were numerous shown, and for a scarlet flesh Mr. Goodacre won the first prize; second, Mr. T. Bannerman, with Scarlet King; and third, Mr. J. Doe, with Sutton's Scarlet. For a green-flesh variety Mr. T. H. Bolton, Beaumaris, North Wales, secured the first prize for a very large and finely netted Royal Jubilee; second, Mr. R. Nisbet, with The Peer; third, Mr. B. Ashton.

There was but one entry for Strawberries, the varieties being Leader, Royal Sovereign, and another variety similar to Leader. Tomatoes were well shown, and for three dishes Mr. J. Read was the victor with Sutton's Best of All, Sutton's Perfection, and another variety; the second prize fell to Mr. J. E. Knight; and the third to Mr. H. Wright, gardener to W. Aldon, Esq., Kingswinford.

Collections of vegetables were not so numerous as on some former occasions. For Messrs. Sutton's prizes Mr. J. Gibson, gardener to R. W. Hudson, Esq., Marlów, was awarded the first prize with medium sized examples of good quality; second, Mr. B. Ashton; and third, Mr. Bastin. For Messrs. Webb and Sons' prizes Mr. W. L. Bastin was awarded the first prize; second, Mr. E. Beckett; and third, Mr. B. Ashton.

#### Medal Awards.

The following is the list of medal awards:—Large gold medal: Smith and Co., Worcester, for plants and cut flowers; Blackmore and Langdon, Bath, Begonias in pots; J. Forbes, Hawick, Phloxes and Carnations; Webb and Sons, Wordsley, Begonias, &c. Gold Medal: Wolverhampton Parks and Baths Committee, foliage and flowering plants; W. Artindale and Son, Sheffield, cut Carnations; W. B. Child, Acock's Green, herbaceous cut flowers; G. Jackman and Co., Woking, Irises, Water Lilies, &c.; Dobbie and Sons, Rothesay, cut flowers; Dickson, Ltd., Chester, cut flowers; Tom B. Dobbs and Co., Wolverhampton, rustic rockery. Silver medal: Jones and Son, Shrewsbury, Sweet Peas; Ranelagh Nurseries, Leamington, Asparagus myriocladus; J. H. White, Worcester, cut flowers and plants; Jarman and Co., Chard, hardy cut flowers, &c.; Hewitt and Co., Solihull, cut flowers; W. Waters, Acock's Green, Violas; the Vineries, Ltd., Acock's Green, Phloxes, &c.; R. Sydenham, Birmingham, Sweet Peas, &c. Bronze Medal: W. D. Bason, Wolverhampton, Sweet Peas, &c.; R. Lowe, Wolverhampton, stove and greenhouse plants; W. Pattison, Shrewsbury, Violas; W. Knight, Wolverhampton, cut flowers; J. Robson, Altrincham, flowering plants; W. and J. Brown, Peterborough, pot plants

and cut flowers. First class certificates: Dobbie and Co., Rothesay, new variety Sweet Peas, Florence Molyneux; J. Forbes, Hawick, new Phlox, Miss Willmott; the Leamington Nurserymen and Florists, Ltd., new Carnation, Leam Queen.

#### Croydon Horticultural, July 8th.

Ideal weather favoured the annual show of the society, which was held in the grounds of Addiscombe Court. Roses were not of very great merit, but the exhibition all through was of interest.

OPEN ROSE CLASSES.—A N.R.S. silver medal and 45s. was accorded as first, and three competitors were forward, the honours falling first to Ben Cant and Son, second to Prior and Son, and third to Frank Cant and Co. B. Cant had no outstanding blooms, but just a good even set, and even some very worthless flowers. Frau Druschki was one of the best; Apotheker G. Hofer was another, and this newcomer is a grand thing when got well. What are its merits or failings? And there were shapely flowers of Marguerite Appert, H. Vernet, and U. Bunner. A good Bessie Brown and Star of Waltham were Prior's choicest; and F. Cant had a nice general set, but rather the worse for wear.

The twenty-four distinct trebles brought no less than five competitors, of whom B. R. Cant was foremost; Prior and Son second, and Paul and Son third. Though decidedly irregular, Ben Cant's set included White Maman Cochet, A. K. Williams, Brunners, Brides, Druschkis, and Papa Lambert; while Bessie Brown and A. Rivoire greatly helped Prior.

D. Prior's twelve of a sort in class 5 were gems of Rose beauty, being smooth, pure, well-finished Bessie Browns. With Frau Druschki (which he shows consistently well) Frank Cant came next; and B. R. Cant third with Her Majesty. The order for twelve Teas or Noisettes in class 6 ran this: F. Cant and Co., Prior and Son, and B. R. Cant, with the respective varieties Mrs. Mawley, Maman Cochet, and Medea. Mr. Will Tayler, of Hampton, led for the twelve bunches of Garden Roses; and for the six, in class 13, Mr. Tate, of Downside, was first.

In class 3A, for two dozen kinds, Mr. T. Butcher, South Norwood, beat Mr. Will Taylor, and third, Mr. F. J. Jeffreys, West Croydon.

Frank Cant led for eighteen Teas and Noisettes (class 4) with blooms much below the average; second Prior and Son, and B. R. Cant third.

The new challenge cup, or bowl, competition in the eighth class, for thirty-six blooms, enticed four entries, and Mr. Tate rather easily led with well set up flowers. His Marchioness of Dufferin was the largest flower of this we have seen, and his Mrs. J. Laing obtained a medal. Mrs. Haywood, of Woodhatch, was a fair second, and Mr. Eversfield, of Horsham, third. Only three faced the judges for twenty-four Roses (class 9), the winners being Mrs. Haywood, Mr. Eversfield, and Mr. Slaughter, of Steyning.

For the eighteen Teas, Mr. Eversfield beat Mrs. Haywood, but the order was reversed for the half-dozen Roses in trebles. Again Mrs. Haywood led for twelve of a kind in class 12, having even flowers of Her Majesty, one of the best sets in the show, and Mr. K. H. Gifford was second with Mrs. Laing. Mr. Ed. Mawley led for twelve distinct varieties with creditable flowers; and Mr. F. Wellesley beat Mr. Eversfield for twelve Teas or Noisettes in class 15. Miss B. H. Langton, of Raymead, Hendon, led with good flowers in four distinct trebles, Mr. Mawley making a weak second. Chief winners in other classes were A. G. Hammond (for nine), Miss Langton for a like number of Teas, and R. W. Bowyer, Hertford, for six distinct in class 19, these being good flowers.

Other features of the show were the Sweet Peas, all poorly staged when we consider the excellent examples of Mr. Eckford and Mr. Jones (Shrewsbury). The double Tuberous Begonia flowers were very excellent, and Gloxinia flowers, with Maiden-hair Fern fronds in vases, were pretty, though one likes best to see the plants. There were also classes for Shirley Poppies—those lovely annuals—and Zonal Pelargoniums. The way to stage stove and greenhouse flowers effectively was demonstrated by Mrs. C. J. Salter, wife of the gardener at Woodhatch Lodge, Reigate, and how *not* to do so was seen on the stage backing her collection. The flowers should be shown in loose, free bunches, taller ones at the back and well held up, and a nice contrast should pervade the lot.

The table decorations were on the whole good, but the eyes of critics are never satisfied. The Croydon ladies, however, are well ahead of their compatriots in many other centres.

Miss E. M. Robinson, Hillside, Purley, led for the decorated table (having five other competitors), Mrs. A. C. Robinson, 3, Stafford Road, Wallington, followed, and Miss Langton third. The winners for twelve cut flower bunches were Messrs. C. Perrett, A. G. Mason, and C. Brooks in this order.

We must compliment Mr. Phillips, gardener to Colonel Inglis, of Craigendorrie, Reigate, on his very handsome group of plants, which won for him £7 and a silver-gilt medal in class 61. The "stuff" was good, well selected, and tastefully put together—a good object-lesson for others. Mr. Lewry, of Duppas Hill

*Passiflora caerulea.*

The blue Passion Flower is all but hardy as a climber, but in any case it is a beautiful cool-house plant. We have always found it to flower freely wherever grown, and it enjoys a fairly rich, well-drained soil; but the roots are best confined, in order to prevent too rampant growth.

Terrace, had the best six Caladiums; and fair samples they were. Table plants and vegetables were more or less mixed up, for the latter lined the front row to a banking of Crotons and Fuchsias, the pungency of Onions affording a spiciness to the sweeter and softer odours of the flowers. The smaller groups and classes for plants do not call for special notice, but the six Zonal Pelargoniums from Mr. A. G. Mason, of 18, Chichester Road, were far superior to what one usually sees.

FRUIT was a small but meritorious section. Mr. F. Phillips led for the six dishes with Melon, Grapes, Figs, Pineapple Nectarine, Madame Trève Pears, and Strawberries. First, second, and third for the Melon went respectively to Mr. O. Jeal, Mr. H. Harris, and Mr. F. Phillips. Mr. J. W. Barks led for three white Grapes with Buckland Sweetwater; second, Mr. Lintott, with Foster's Seedling; and third, Mr. Harris, with the same. Mr. Lintott had the best fifty Strawberries; Mr. Lintott the best three black Grapes; with C. Blurton second, both having Hamburgs, and Mr. J. W. Barks third. Good Tomatoes were staged, Mr. Phillips leading for six in class 48, and J. Knapp for six in class 59.

Four collections of salads were presented, and the winners were Mr. Collins, of Park Hill; Mr. Perrett, of Duppas Hill; and Mr. Lewry, third, each with excellent basketsful. There was fair competition in the other classes.

Among non-competitive exhibits were Sweet Peas in pots from J. Peed and Son, Cannas and Kochia scoparia from Messrs. Cannell, stove and greenhouse plant groups from John Laing, of Forest Hill, cut flowers from Cheal, of Crawley, Amos Perry, and Thos. Ware, Limited. Paul and Son and Geo. Jackman and Son each staged collections of Roses, while John R. Box had rock plants and Begonias.

### Ealing Horticultural, July 8th.

Ealing grows rapidly in population, but at the cost of a decline in the quality of the exhibits seen at the exhibition of the horticultural society. Small estates, the gardens of which at one time furnished many specimen plants, cut flowers, and fruit, have been built over: there is a multiplication of small villa residences; but large gardens disappear in a regretful manner. An Ealing exhibition has therefore deteriorated in quality, and as, with the exception of two classes, which are thrown open to all comers, the exhibits must come from the immediate neighbourhood, the range is a limited one. Still, a very respectable exhibition is provided, and that for 1903 took place in Walpole Park, in the centre of the town, four large tents being required.

Plants consisted of groups arranged for effect, and these were shown in two classes. In the case of the large group the first prize was taken by Mrs. Peal, Fernhurst (S. Whittaker, gardener), who made good use of some tall Fuchsias, with which he associated other flowering and some good flowering plants. Mr. John Harris, Northcommon Road (W. Roberts, gardener), took the second prize with a neat and effective group. In the case of the smaller group Mr. H. W. Peal, the Mayor, Oakhurst (C. Edwards, gardener), was first, and Mr. M. Hulbert, Edghill Road (T. Skingle, gardener), second. There were two classes for fine-foliaged plants, one for six and one for four specimens; and also for Ferns and plants in flower, none of the exhibits calling for special remark. In the class for six plants for table decoration, in which Mr. F. G. Glodstanes, Old Manor House (F. Milson, gardener), was placed first with some bright and even specimens. Among them was *Leca amabilis*, a plant having deep olive green leaves veined with silver, the genus having been named after James Lee, the father of John and Charles Lee, who had the Vineyard Nursery at Hammersmith. It was in such charming character that it seems a pity it is not more generally grown. Caladiums were fairly good. The best specimen flowering plant was *Begonia corallina*, and the best foliage plant *Asparagus plumosus*, both good examples. Some good bush and standard Fuchsias were staged; there were excellent *Streptocarpus* from Mr. A. G. Dixon, and excellent *Gloxinias* and *Begonias* from the Mayor, which did his gardener much credit. Mosses were good, and so were *Petunias*, in both cases the first prizes going to Mr. M. Hulbert.

Two classes for Roses, viz., one for forty-eight blooms and one for twenty-four blooms, are open to all comers, and on this occasion Messrs. G. and W. Burch, nurserymen, Peterborough, were first in both classes, and they staged very fine Roses, among them Her Majesty, Bessie Brown, Souv. de President Carnot, A. K. Williams, Ulster, Antoine Rivoire, Marchioness of Londonderry, Gladys Harkness, Lady Mary Fitzwilliam, Frau Karl Druschki, Mildred Grant, Comte de Raimbaud, Kaiserin Augusta Victoria, White Lady, Mrs. Sharman Crawford, Madame Cadeau Ramey, Lawrence Allen, &c. Mr. C. Turner, Royal Nursery, Slough, was second with good bright blooms, somewhat smaller, the leading varieties much the same. Roses were also creditably shown by local amateurs. The society's silver cup, offered for twenty-four blooms, was won by Mr. W. Owen, Castlebar (R. Green, gardener). Other cut flowers included stove and greenhouse subjects, *Gloxinias* in bunches, finely shown by the Mayor and others. There were

good cut *Begonias*, bedding and Ivy-leaved *Pelargoniums*, hardy flowers, and Sweet Peas.

Fruit is never a strong feature at Ealing, but the usual quality was lifted up a bit through Mr. Mitson showing good white and black Grapes, and also Strawberries; other hardy fruits were scarce. The gardeners also showed vegetables in several classes.

From the allotment gardens at Ealing, of which there are a large number, the cottagers brought excellent produce, which made some of the vegetables staged by gardeners look inferior. There were several classes for small collections, in which good produce was staged; they had excellent Potatoes, round and kidney; Cauliflowers, Peas, Longpod and Broad Beans, wonderfully fine white Tripoli Onions, and Vegetable Marrows, and interesting collections of herbs and salads, altogether a valuable addition to the show.

There were pretty table decorations arranged by the ladies of Ealing, also stands, vases, bouquets, dinner tables, &c.; and Mrs. H. B. Smith, Court florist, Ealing, set up some delightful illustrations in floral decorations, which proved valuable object lessons for the ladies who take a part in the competitions.

A group of plants contributed by Mr. James Hudson, Gunnersbury House Gardens, had as a foreground flowers of *Nymphaea stellata*, and a large and deeper blue variety from Berlin named W. Stone; also a large seedling from *gigantea*, and several varieties of the fine new hardy Water Lilies of recent years, all in water, an extremely attractive exhibit. Mr. Geo. Reynolds sent from Gunnersbury Park a very fine group of plants also, including Palms, *Ixoras Fraseri* and *Williamsi*, several very fine Carnations in pots, a batch of the blue-flowered *Exacum macranthum*, &c. Messrs. Fromow and Son, nurserymen, Turnham Green, set up a very fine collection of admirably coloured Japanese *Acers*, mingled with white Lilies.

### Hereford and West of England Rose, July 8th.

The thirty-seventh of the annual exhibitions of this society was held on Wednesday, July 8. We regret to say that the effect of the late cold and ungenial season was conspicuous everywhere, though mostly in the fewness of the exhibits, as many blooms in the boxes staged by Alexander Dickson and Sons, Newtownards, Belfast, and the King's Acre Nurseries, Hereford, were of superior quality. It was very unfortunate that several Rose exhibitions were fixed for the same day. There is a great deal in what your bright critic, Mr. W. R. Raillem, lately proposed in our Journal, that the National Rose Society, on the lines of the Marylebone Cricket Club, should fix the dates for the several Rose shows; but, alas! such a plan would be utterly unpractical. We of Hereford, for instance, the oldest Rose show in existence, never would consent to take a back seat, and yet would have to do so in friendly rivalry with the great centres of industry and trade, railway supplied from every quarter, such as Birmingham, Leeds, Manchester, &c. This difficulty unfortunately exists; but, it is to be remembered, always has existed. I happen to have a schedule of our Rose show for 1877, where "£35 special prizes are offered to nurserymen for seventy-two varieties, *not residing in Herefordshire*"; and this apparently tempting offer failed to draw, though supplementary of the ordinary prize list of £150! No; all affiliated Rose societies, to pay their way, must, as a rule, expect to be more or less localised, and trust to other floral and scenic attractions, as we of Hereford, through our thoroughly up-to-date hon. sec., have every year been successful. We also find that collections of herbaceous plants are most attractive, and in great favour with the general public. Still, your old-fashioned reporter heaves a heavy sigh over the Rose show. It is interesting to notice how different varieties of Roses have their year, and doubtless with some advantage, as bringing to the front some first-rate varieties which otherwise would die out, and preventing a superabundance of other favourites. How few of La France we have seen this year! But those two new H.P.'s, without comparison the best dark and light, Ben Cant and Frau Karl Druschki, both of exceptionally strong growth, have been good, the latter particularly so.

Messrs. Alexander Dickson and Sons carried all before them, gaining every first prize in their power, except the twelve of any one light variety, which first prize they divided with the King's Acre Nursery Co., Ltd., Hereford. Subjoined is a list of Alex. Dickson and Sons' best blooms, and the names of others rarely seen: Mildred Grant (superb), Duchesse de Vallombrosa, Star of Waltham, Lady Mary Fitzwilliam (grand), Gladys Harkness, Bessie Brown (immense), Frau Karl Druschki (superb), Florence Pemberton (new, good), Robert Scott (a great acquisition), Lady Clanmorris, Antoine Rivoire (splendid centre), Danmark (good), Ulster (grand), Madame Delville (splendid), Alice Lindsell, Xavier Olibo, Marchioness of Dufferin, Mrs. Conway Jones (new), Mrs. E. Mawley (fine), Chas. Darwin, Countess of Annerley (fine, new), Mrs. Geo. Kirk (new), Killarney, Sir Robert Stout, Duchess of Albany, C. Delhomme, Lena (new, good), Edith Dombbrain (grand), Liberty, Marchioness of Downshire (magnificent), and Prince Arthur. Of these; Alice Lind-

sell, Florence Pemberton, Edith Dombrain, Mildred Grant, Robert Scott, Bessie Brown, Frau Karl Druschki, and Ulster were very fine blooms. Second prize The King's Acre Co., which included magnificent specimens (though smaller than the first prize) of Caroline Testout (very fine), Frau Karl Druschki (superb), White Lady (lovely), and Danmark (very good).—HEREFORDSHIRE INCUMBENT.

In the "36's" Messrs. Townshend and Sons, of Worcester, repeated their last year's success with a very praiseworthy display, including Alphonse Soupert, Queen of Queens, Countess of Oxford, Marjorie, Grace Darling, Killarney, and Clio. Mr. Pewtress was second with a good show, including Duchess of Bedford, Ulster, Mrs. Edward Mawley, and others.

Amongst the successful amateurs were several prominent growers, including Mr. Conway Jones, Mr. R. Foley Hobbs, Preb. Ashley, Mr. W. E. King-King, Mr. T. Llanwarne, and others. The silver medal for the best Hybrid Perpetual exhibited by an amateur was won by Mr. Conway Jones, of Gloucester, with the Marchioness of Londonderry. He was the first prize winner in the class for twenty-four varieties, and showed some lovely specimens, including White Maman Cochet, Crown Prince, Souv. de President Carnot, Maman Cochet, Ulster, Lady Moyra Beauclerc, Madame Cusin, Comtesse de Commarde, Madame L. Ramey, Innocente Pirola, Kaiserin Augusta Victoria, Suzanne Marie Rodocanachi, and others. Mrs. Mawley was regarded as the best bloom in division three, for Herefordshire amateurs, who showed up very favourably with the nurserymen. Despite the season there was an excellent show of the Tea and Noisette varieties.

In the nurserymen's class for twelve varieties Messrs. Townshend and Co. were well deserving of the first prize, their collection being a fine one. Messrs. Pewtress Bros.' stand of blooms made a good second, however, their Mrs. Edward Mawley being a nice bloom. A striking stand was that of Mr. Conway Jones, who took first, and also the silver medal of the National Rose Society, in the amateur class for twelve distinct varieties. There was a keen struggle for premier honours in the open class for twelve of one sort of any light Rose between Messrs. Dickson and the King's Acre Nurseries, who each exhibited Mildred Grant. Both exhibits were of great merit, and undoubtedly they were the best two boxes of blooms in the show. The first prize was divided between those well-known firms. In the dark Rose class Messrs. A. Dickson and Sons won with a box of Tom Wood, the King's Acre Nurseries being second with Alfred K. Williams. Messrs. A. Dickson and Sons were the only exhibitors in the class for yellow Roses, but their box of Augusta Victoria fully deserved the first prize. They were again successful in gaining the first prize in the class for white Roses with a good box of Bessie Brown.

In the class for garden Roses of not less than six varieties, the first prize went to Messrs. Townshend, of Worcester, a noteworthy feature in their collection being the Crimson Ramblers. Mrs. Davenport was second with a good collection, embracing well known varieties. Messrs. Townshend were also given first in the class for hybrid Sweet Briars.

### Southampton, July 8th and 9th.

Much the best of the many good shows held on the Royal Pier was that under notice, held under the auspices of the Royal Southampton Horticultural Society. Roses, in numbers, were, perhaps, the weakest feature, although in point of quality little was left to be desired. Sweet Peas were a magnificent display, hardy flowers excellent, fruit and vegetables numerous and good, especially the latter, while trade exhibits added immensely to the interest of the show. As usual, the necessary arrangements were of that high order of merit which is the rule here under the experienced guidance of Mr. C. S. Fudge, the courteous secretary.

**ROSES.**—For thirty-six, distinct, Messrs. D. Prior and Son, Colchester, were distinctly ahead with medium sized, highly coloured fresh blooms, especially noteworthy being Madame Cochet, Alfred Colomb, Francois Michelon, Innocente Pirola, Charles Darwin, White M. Cochet, Madame E. Verdier, Madame Sharman Crawford, Jeannie Dickson, Marchioness Londonderry, Her Majesty, and Ernest Metz. Messrs. Rogers and Son, Bassett Nurseries, Southampton, second, with smaller, well coloured blooms.

For twelve triplets, distinct, Messrs. Prior again won with representative blooms of Bessie Brown and Mrs. W. J. Grant. Messrs. Rogers were again second. In the class for twelve Teas or Noisettes the competition was exceedingly keen, many fine stands being staged. Mr. W. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, secured the coveted award with a magnificent exhibit of White M. Cochet, M. Cochet, Madame Hoste, Anna Olivier, Madame Cusin, Golden Gate, and Mrs. E. Mawley. Messrs. Prior here had to be content with second place, although the exhibit was a capital one. Messrs. Rogers third. For six, any one dark variety, Messrs. Prior won with Gustave Piganeau; Messrs. Rogers following with Marquise Litta. No less than seven entered for the six of any light variety, Mr. G. H. Kent, gardener to Mrs. E. Croft Murray, Perivale, Ryde, winning with White Maman Cochet; Mr. G.

Ellwood, gardener to W. H. Myers, Esq., M.P., Swanmore Park, Bishop's Waltham, second, with very fine Caroline Testout; and Messrs. Prior third with Bessie Brown.

Gentlemen's gardeners and amateurs was a strong section, so numerous were the exhibits. For eighteen, distinct, five competed. Mr. Neville was the most successful, winning with a capital set. D. D. Seaton, Esq., Woodside Cottage, Lymington, was a good second; and Mr. G. H. Kent third. For the twelve and for twelve Teas or Noisettes Mr. Neville was unassailable, staging magnificent blooms of W. J. Grant and Frau Karl Druschki. D. Seaton, Esq., followed in both classes. For twelve, in not less than eight varieties, Mr. O. Trickler, gardener to A. Searle, Esq., Ashton Lodge, Bassett, won with a good exhibit of popular varieties.

Six competed for a vase of Roses. Mr. T. Hall, gardener to Sir S. Montagu, South Stoncham House, Southampton, was first; Mr. Barnes, gardener to Mrs. Austin, Bishop's Waltham, second. For a basket of Roses, open to ladies only, Miss Minnie Snellgrove, 10, Oxford Road, Southampton, won first with an admirable display; Mrs. C. S. Fudge followed exceedingly close; Mrs. Jeffrey third.

**SWEET PEAS.**—Competition in these classes was keen, and a magnificent display was the result. For nine distinct varieties, arranged with their own foliage, no less than twelve competed, making a charming display. Mr. C. W. Breadmore, 120, High Street, Winchester, secured the leading award with grand examples of the following: Lord Rosebery, Navy Blue, Salopian, Miss Willmott, Gracie Greenwood, Lady Grisel Hamilton, Jeannie Gordon, Duke of Westminster, and Dorothy Eckford. H. H. Lees, Esq., Grosvenor Villa, Portswood, a very close second, staging marvellous blooms of similar varieties. Mr. T. Hall, a good third.

Mr. R. Sydenham, Birmingham, offered the prizes for nine distinct varieties, for which seven competed. Mr. T. Matthews, gardener to Mrs. Maltby, Shirecroft, Botley, won with a good set: Hon. F. Bouverie, Miss Willmott, Coccinea, Prince of Wales, and Black Knight were the most conspicuous. Mr. A. Maple, Shirley, second; Mr. F. Cozens, Downhams, third. Mr. Breadmore also offered prizes for nine varieties. Mr. C. H. Holloway, gardener to Lord Aberdare, Longwood House, Winchester, secured the premier award; Mr. F. M. Vokes, Birch Lawn, Sholing, second; Mr. Cozens, third.

**HARDY FLOWERS** were a great feature of the show. For twelve bunches, distinct, five staged. Messrs. B. Ladhams, Limited, The Nurseries, Shirley, were the most successful with a charming display of the following: Gaillardias oculata and Brilliant, Pentstemon azureus, Rudbeckia californica, Centaurea macrocephala, Delphinium President Loubet (fine spike of the richest blue), Campanula coronata alba, Centaurea ruthenica, Alströmeria pulchella, Oenothera speciosa, Genista tinctoria plena, and Paeonia Faust. Mr. Ellwood was a good second; and Mr. Breadmore third. For nine bunches, Mr. Valentine, gardener to H. E. Sugden, Esq., Ingersley, Chilworth, won with a good display; Mr. Vokes second, and Mr. W. Osman, gardener to Mrs. Anderson, West End, third.

**PLANTS** were fairly well shown. For four stove and greenhouse specimens Mr. E. Wills, The Nurseries, Southampton, was first, as also was he for the best group of miscellaneous plants arranged for effect. Mr. T. Hall won for three Palms, six Caladiums and six Zonal Pelargoniums. Ferns were well staged by Mr. F. W. Bowles, gardener to F. W. Spranger, Esq., Spring Hill Court, Shirley. Mr. Wills had the best Begonias.

**VEGETABLES** always are grandly staged here. This year they were even better than at any previous show. Messrs. Toogood and Sons, Southampton, provided handsome prizes for six distinct varieties, for which no less than eight competed. Mr. E. Beckett, gardener to Lord Aldenham, Aldenham Park, Elstree, Herts, easily won the coveted award with grand examples of Champion Potato, Tremendous Pea, Wonderful Tomato, and Intermediate Carrot. Mr. J. Mitchell, gardener to J. Willis Flemming, Esq., Chilworth Manor, second, Mr. Holloway third. In the class where the prizes were provided by Messrs. Sutton and Sons, for six distinct dishes, the real tug of war came between the two champions, Mr. Beckett and Mr. Gibson, gardener to R. H. Hudson, Esq., Danesfield, Marlow. Mr. Beckett just managed to secure the leading place with magnificent examples of Duke of York Potato, Perfection Tomato, Duke of Albany Pea, White Leviathan Onion, Early Giant Cauliflower, and New Red Intermediate Carrot. Mr. Gibson excelled in Tomatoes and Onions especially, but dropped in Peas and Cauliflowers. Mr. Bowerman, gardener to Lord Bolton, Hackwood Park, Basingstoke, third, with a capital collection. The last-named was the most successful for Messrs. Carter's prizes, with a good all-round exhibit; Mr. Vokes second.

**FRUIT**, though not largely shown, was good in quality. For three bunches of Grapes, distinct, Mr. O. Eastwell, gardener to L. Walker-Munro, Esq., Rhinefield, Brockenhurst, was first with Madresfield Court, Foster's Seedling, and Black Hamburgh; Mr. Holloway second. For two bunches, black, Mr. Eastwell was also successful with very fine Madresfield Court; Mr. Ellwood staged Black Hamburgh in good condition for second prize; Mr.

Bowerman third. Mr. Eastwell with Foster's Seedling won in the white Grape class; Mr. Bowerman second. For two dishes of Strawberries Mr. Hall won with magnificent examples of Webb's Refresher and Sir J. Paxton. Mr. Matthews won for one dish. The best Peaches were staged by Mr. W. Valentine.

NON-COMPETITIVE EXHIBITS were numerous, and added much to the beauty and interest of the show. Silver-gilt medals were awarded to the following:—Messrs. B. Ladhams for herbaceous plants, who staged grand bunches of Delphiniums, English Iris, Pentstemons, Potentilla W. Rollisson, Thalictrums, Heucheras, Coreopsis, and Phloxes. To Messrs. J. Peed and Son, Roupel Park Nurseries, Norwood, for a magnificent display of Gloxinias. To Mr. W. C. Breamore, Winchester, for a fine dozen bunches Sweet Peas, distinct varieties, of wonderful quality. To Mr. J. M. Newton, gardener to W. Garton, Esq., Roseland, Woolston, for a group of miscellaneous plants, and another of finely grown Gloxinias and Pelargoniums.

Silver Medals were granted to the following:—W. H. Myers, Esq., M.P., for thirty-six bunches Garden Roses, distinct, of which the following were conspicuous: Gustave Regis, Queen Alexandra, Psyche, Macrantha, Papa Gontier, Leuchstern, Bardou Job, Madame Eugène Resal, Lucida plena, Crimson Rambler, and Cheshunt Scarlet. To Mr. M. Prichard, Christchurch, for hardy flowers, Japanese Iris, Alströmérias, Spiræas, &c. To Mr. Wills for miscellaneous plants, wreaths, &c.

### Bath, July 9th.

Despite the unfavourable traits of the season Bath maintained its old traditions so long associated with the summer show and the delightful show-ground, the Sydney Gardens. Fine weather, a large entry, and good attendance of the flower-loving public should help to reimburse the former shortcomings in the committee's exchequer.

Roses, which by common consent are the great feature of the show, though they tell eloquently some tales of past weather, were nevertheless magnificent and abundant, and attracted growers from a wide area. In the class for seventy-two distinct Messrs. A. Dickson, Newtownards, were once more the victors, their stand being conspicuous by its high quality. Amongst the best were Madame Eugène Verdier, Ulrich Brunner, White Lady, Comte Raimbaud, E. Y. Teas, Due de Rohan, Mrs. J. Laing, Frau Karl Druschki, Caroline Testout, François Michelin, Gladys Harkness, Helen Keller, Mildred Grant (extra fine), Lady Mary Fitzwilliam, Souv. de Pres. Carnot, Auguste Rigotard, Madame Cadeau Ramey, Florence Pemberton (fine), Duchesse de Morny, Louis Van Houtte, Robert Scott, Bessie Brown, and Mrs. George Kirk (new). Messrs. Harkness and Co., Hitchen, came second; Souv. de President Carnot, Her Majesty, Mrs. J. Laing, Alfred Colomb, Helen Keller, and Marquis Littà were their best. The King's Acre Nurseries, Limited, secured the third prize; Earl of Dufferin, Mamie, Mildred Grant, Bessie Brown, Ernest Metz, and Hon. E. Gifford were very fine.

For thirty-six varieties in triplets Messrs. Dickson again won from the King's Acre Nurseries, staging good flowers among others of Louis Van Houtte, Marchioness of Dufferin, Bessie Brown, Alice Graham, Tom Wood, Mrs. Ed. Mawley, Dr. Andry, Marie Baumann, and Madame Cadeau Ramey. In the second prize exhibit were Charlotte Gillemot, Mrs. R. G. S. Crawford, Madame Abel Chatenay, and Killarney, distinct and good. Messrs. Cooling and Sons, Bath, were third.

Messrs. Townsend and Sons, Worcester, won with eighteen triplets, with Mrs. Sharman Crawford, Mrs. J. Laing, Killarney (fine), Bessie Brown, Kaiserin A. Victoria, and Mildred Grant in excellent order. Mr. G. Prince, Oxford, was second, showing as his most distinct Jean Ducher, The Bride, Maman Cochet (good), Mrs. E. Mawley, Comtesse de Nadaillac, and Souv. de S. A. Prince, very fine and pure. Messrs. A. A. Walters and Son, Bath, showed some very superior blooms for third place, notably Mrs. Ed. Mawley, Alfred Colomb, Madame A. Chatenay, and Duchesse de Morny. The class for thirty-six distinct varieties brought out a good competition, Messrs. Townsend and Sons winning first, Captain Hayward, Marquis of Downshire, Louis Van Houtte, Ellen Drew, Madame J. Cointet, Mrs. W. J. Grant, and a fine Comte Raimbaud being their best; Messrs. Walters and Son were second, and Mr. G. Prince third. The last named exhibitor secured the premier card for eighteen Teas or Noisettes, with nice blooms of Comtesse de Nadaillac, Souv. d'Elise Vardon, Maréchal Niel, White Maman Cochet, Golden Gate, and Catherine Mermet. Mr. J. Mattock, Oxford, was second; and Messrs. Townsend and Son third. An interesting and well-contested class was that for Roses in vases, twelve varieties, five blooms in each. Here Messrs. Cooling, Bath, secured leading place with remarkably fine and fresh blooms. Souv. de President Carnot, Robert Scott, Maman Cochet, Liberty, Madame J. Dupuy, and Bessie Brown were conspicuous. Mr. G. Prince came second, and Mr. J. Mattock third.

With Bessie Brown in perfect condition Messrs. Dickson won

with twelve of any one variety; Mr. Prince second with Mildred Grant. The King's Acre Nursery Co. and Mr. G. Prince won with twelve white or yellow, each staging Kaiserin A. Victoria. A bright stand of A. K. Williams won for the King's Acre Nursery Co. the prize for twelve crimson Roses; Messrs. Dickson following with Tom Wood. The latter took the lead in a class of twelve light pink or rose-coloured varieties with Mildred Grant. With six blooms of any new Rose Messrs. Dickson again won with Mildred Grant, a variety much in evidence, and greatly admired. Mr. Prince was second with the same variety.

With Garden Roses the Bath nurseries came out strongly, and their united efforts made an altogether fine and pleasing relief to the otherwise formal Rose exhibits in boxes. Messrs. Cooling and Sons and Messrs. Walters showed tables 8ft by 3ft very effectively set out with eighteen sorts in good-sized bunches. Madame J. Grolez, Irene Watts, Madame Falcot, Papillon, Killarney, Marquis of Salisbury, Ma Capucine, Luciole, and W. A. Richardson were distinctly good. Messrs. Walters won second with similar varieties. From the same nurseries came single and Moss Roses; also decorated tables, principally of Roses.

In the amateurs' section were some beautiful flowers from well-known competitors. For twenty-four distinct varieties Conway Jones, Esq., Gloucester, won first, showing bright, full blooms of Gladys Harkness, Comtesse de Nadaillac, Lady Londonderry, White Maman Cochet, Chas. Lefebvre, Edward Andry, and Ulrich Brunner. Second prize fell to the Rev. J. H. Pemberton, Havering, Essex, with Papa Lambert, Victor Hugo, Bessie Brown, Her Majesty, and François Michelin. A. Hill Gray, Esq., Bath, came third, but was more successful in the class for twelve triplets. Conway Jones, Esq., was second, and the Rev. J. H. Pemberton third. Mr. R. Foley Hobbs, Worcester, the Rev. R. Powley, and R. B. Cater, Esq., shared the prizes in the order of their names for eighteen distinct. There were classes, too, for twelve singles and six triplets, as well as local classes, and all were keenly contested.

The N.R.S. medals for the best individual blooms were awarded to Messrs. Dickson for Mildred Grant (H.P.). To Mr. J. Mattock, for Tea or Noisette, White Maman Cochet. In the corresponding classes for amateurs the Rev. R. Powley, with A. K. Williams (H.P.), and Mr. Conway Jones, with Niphotos, secured silver medals of the N.R.S.

Begonias, which form a section of the show, made a bright and pleasing display, both as plants and cut blooms. Needless to say, local growers won with the greatest ease and credit to themselves. Messrs. Blackmore and Langdon staged a large and rich display of single and double flowering plants, interspersed with Asparagus Sprengeri and bunches of cut Carnation blooms. Among named kinds we observed a monster bloom of Mrs. A. Hall, of a salmon shade; Frilled Beauty, pale salmon; Sophie, yellow, shaded blush; Mrs. G. F. Hodder, pink; Mrs. Portman Dalton, pink blush; Grand Duchess, salmon; Flambeau, orange; Catullus, crimson; Ida, a prettily frilled yellow, shaded salmon; and an unnamed but magnificent white were conspicuous among a host of others of high class.

Strawberries, for which Bath is famous, were as remarkable for their size, colour, and quantity as on many previous occasions. Mr. W. D. Porter, of Batheaston, won with six dishes, Royal Sovereign, President, Sir Joseph Paxton, and Latest of All being shown. Mr. Ricketts was second, and Mr. W. Vilven, Box Hill Gardens, Bath, third. The last named staged the most interesting because the most varied display. The new Laxton in this collection was the only representative of the variety on view, Trafalgar, Eleanor (fine), Sir J. Paxton, Fillbasket, and Royal Sovereign comprising the other kinds shown. With three dishes Messrs. J. and E. Ricketts and Mr. Vilven won with similar varieties of even larger size than in the preceding class, Climax being a distinct dish in the third prize lot. Royal Sovereign secured both first and second prizes in the single dishes, but they were distinctly dissimilar in colour, that from Mr. T. A. Ware being so much darker than those from Mr. Vilven, who was second, but both were handsome dishes of fine ripe berries.

The show is by no means limited to the title of the schedule—Rose, Begonia, and Strawberry—for a wealth of varied flowers and plants, artistically dressed tables, vases, bouquets, wild flowers, Sweet Peas, groups of plants, vegetables, stove and greenhouse plants and cut flowers, herbaceous flowers in large, bright bunches, all combined to please and interest and to cater for every taste. The bouquets of Roses were much admired, more especially those from Messrs. Perkins, of Coventry, who staged the six, and also the shower bouquets, in their well-known artistic style. Baskets of Roses, too proved an attractive feature, but in this Messrs. Perkins were placed second to Messrs. Walters, of Bath, certainly a compliment to the latter, which was probably not expected, though duly valued. Messrs. Cole and Son also successfully competed in these classes. Ideal weather, high-class music, good management, abundant tree shade, and a large and aristocratic attendance combined to make the Bath Floral Fête a popular and much enjoyed function, and deserving well of the painstaking secretaries, Messrs. Pearson and Jeffery.

## Woodbridge, Ju'y 9th.

This excellent and enthusiastic society held its annual exhibition and fête this year in fresh grounds. For certainly over twenty—I am told nearer thirty—years it has been in the Abbey grounds belonging to Mr. Carthew. This year the Grange grounds belonging to Major Howey were occupied, and though farther from the station they seemed quite as suitable as the old site. The morning was hot, people could not be persuaded to take down the tent walls, and the arrangement of Roses was consequently again a toil and a trouble, instead of a pleasure.

In the open class, thirty-six Roses, for the handsome challenge cup, there were four exhibitors, and a troublesome and difficult task it was to decide between the two best stands. It was so close that the judges would certainly have awarded equal firsts

Mildred Grant as the medal Rose for best H.P. or H.T.—no doubt the best, but nothing out of the way—and a pretty good Mrs. J. Laing. Rev. A. Foster-Melliar second with Bessie Brown as perhaps his best; and Mr. F. Curtis third. Mr. Orpen was also first for twelve, showing a fine White Maman Cochet; and Mr. Foster-Melliar second with good Duc d'Orleans and Mamie; Mr. R. Steward was third. In six Teas, Mr. Foster-Melliar was first, with both Maman Cochets and Mrs. E. Mawley (good); Mr. Orpen second with a good Bride; and Mr. Steward third. In six Teas of a sort Mr. Orpen was first with White Maman Cochet, Mr. Curtis second with Maman Cochet, and Mr. Steward third, with Mrs. E. Mawley.

In the smaller and local classes, which were well patronised and showed here and there considerable promise, there was one extraordinary bloom which very easily took the Tea medal, and

Arrangement of Rhododendrons. (See page 52.)

if it had not been for the cup; as it was the first place was eventually given to Messrs. Harkness, who had a few extra fine flowers, among which were White Lady, Mildred Grant, and Duchesse de Morny. The stand which so nearly made a dead heat of it came from Messrs. Prior, and contained very fine samples of Frau Karl Druschki, Mildred Grant, Bessie Brown, and Maréchal Niel. Messrs. B. R. Cant were third with smaller flowers. In the open class for twenty-four, Messrs. Prior were first, having the same flowers extra good, as often happens; B. Cant was second, and Harkness third. In the open class for twelve Teas, Frank Cant and Co. were easily first, Messrs. Prior second, and B. Cant third. In Garden Roses, Frank Cant was again a good first, and B. Cant second, showing a fine bunch of the new Rose Mrs. B. R. Cant.

The heat soon took "all the goodness" out of the amateurs' weaker H.P.'s. For twenty-four, Mr. Orpen was first, with

was undoubtedly far and away the best Rose in the whole show. This was a Maman Cochet, shown by Dr. Pallett in a class for six. It was not only very large, but was completely and fully developed, a state of things seldom seen with the variety, as a more frequent exhibitor would no doubt have cut and shown it successfully in a half-open state. It had also evidently never been tied up, exposed to considerable heat, and kept quite dry and clean. It was by some distance the best specimen of the variety I ever saw, and am glad to state that it has been photographed, and I should recommend the N.R.S. to get a copy of it for their next catalogue.

I hope some other hand has sent some account of the other departments of this very fine horticultural show, as they appeared to be thoroughly worthy of the great reputation that Woodbridge Show has attained under the popular management of Mr. J. Andrews, the hon. secretary.—W. R. RAILLEM.

### Ulverston Rose, July 10th.

The Ulverston Rose Show seems to become more popular each year, judging from the enormous attendance of fashionable visitors. Todbusk Park is quite an ideal place for a show. The committee know that for a long summer afternoon there must be something more provided than a view of the flowers, and they secure the services of the best musical bands they can get.

Turning to the exhibits, which were arranged in a fine marquee, some 210ft. by 30ft., Messrs. Alexander Dickson and Sons, Ltd., Newtownards, Co. Down (and Ledbury), staged some wonderful blooms in every open class, taking no fewer than fourteen first prizes, a gold medal for the best bloom in the show (with Mildred Grant), bronze medal for the best H.P. (Horace Vernet), and for the best new Rose with Countess of Annesley, a charming soft pink variety of splendid build. Their first prize stand of herbaceous plants was probably the finest ever staged at this season of the year, and was a tribute to the Emerald Isle.

For seventy-two distinct trusses they quite excelled themselves with blooms of Lady Clannmorris, Alice Lindsell, Mildred Grant, Mrs. Conway Jones (a lovely flower certain to become popular), Mrs. D. McKee (a rich new primrose H.T.), Ulster, Robert Scott, Helen Keller, Florence Pemberton, Mrs. W. J. Grant, Etienne Levet, Frau Karl Druschki, and five superb unnamed seedlings. For thirty-six distinct they scored again with a very heavy stand. H. V. Machin, Esq., for second place, had moderately sized flowers.

In the sixteen trebles, they had exceptional blooms of Frau Karl Druschki, Lady Derby (to be heard of later), Bessie Brown, Alice Graham, and Alice Lindsell. For eighteen distinct the same exhibitors led, having splendid flowers; H. V. Machin, Esq., came second. For twelve T.'s or N.'s, first A. Dickson and Sons, and for twelve new Roses, distinct, with an admirable stand, consisting of Gladys Harkness, Mildred Grant, Mrs. D. McKee, Alice Graham, Frau Karl Druschki, Countess of Annesley, Duchess of Portland, Robert Scott, Lady Derby, Duchess of Westminster, and a fine seedling. They had Mildred Grant in fine form for the best twelve light; Tom Wood was their best twelve darks; and Mrs. E. Mawley their twelve Teas. H. V. Machin, Esq., staged well in some of these classes.

The gold medal was awarded to the Irish firm for taking the highest points.

In the amateur section there were many very choice stands; in fact, a decided increase throughout, not to be wondered at considering the favourable prizes offered. The attraction in section B was the gold challenge cup, value fifteen guineas, and medal, for twelve blooms. This was won for the second time in succession by F. W. Tattersall, Esq., Morecambe, with a very rich coloured set of flowers; Mr. R. L. Garnett, Laneaster, a splendid second; and Rev. R. Langtree third. For eighteen distinct the Rev. R. T. Langtree scored a fine victory, as did J. H. Midgley, Esq., for twelve in trebles. The latter's stand of eighteen Teas or Noisettes was much admired. Messrs. Machin and Garnett followed closely. Bronze medals were given for the best single blooms, the varieties being Gustave Piganeau, Mrs. W. J. Grant, and Innocente Pirola, shown respectively by Messrs. Machin, R. L. Garnett, and H. E. Johnson.

There was a very spirited competition in classes for growers of less than 300 plants, a valuable cup (the gift of the Ulverston Urban Council) and N.R.S. silver medal, were offered for nine distinct, being handsomely won by F. J. Harrison, Esq., Ulverston; William Postlethwaite, Esq., and H. E. Johnson, Esq., winning in the remaining large classes.

Miss Nina Dickson, Newby Bridge, made a fine display with nine new Roses; whilst the Myles Woodburne challenge trophy and N.R.S. silver medal were secured by Mr. H. E. Johnson. Scarcely lacking in point of interest to the Roses were the Sweet Peas, which occupied almost all the side staging. The J. Towers Settle challenge trophy, value twenty guineas, to be held for twelve months, and a cash prize, brought out a fine array. The victory—a good one—rested with Mr. Mark Firth, Leicester, with splendid flowers. Mr. R. Bolton, Carnforth, was a smart second, and Messrs. Jones and Sons, Shrewsbury, close third. For twelve varieties, Mr. Firth left all comers; and for the challenge trophy, value ten guineas, given by the late Mr. Settle, and confined to local growers, Dr. Jackson, of Ulverston, distinguished himself. For twenty-four varieties of herbaceous plants, R. L. Garnett, Esq., staged superb bunches, colour and freshness standing out most prominently. J. H. Midgley, Esq., won for twelve varieties.

Stocks are largely cultivated in the Lake district, and never has it been my lot to see them so well grown; whether as plants or cut spikes there was the same high standard. Mrs. Atkinson won in three classes, and Mr. J. Sharp the remainder.

The trade added much to the beauty of the show. Messrs. Jones and Sons and R. Bolton staged large collections of all the finest Sweet Peas; Mawson and Son, Windermere, had a grand table of herbaceous and bulbous plants; Mr. Edwards, Notts, artistic table decorations; and Mr. J. Sharp, Stocks, and all received certificates. Another striking attraction was a group of admirably grown Malmaison Carnations from Mr. Fenner, gardener to Victor C. W. Cavendish, Esq., M.P., of Holker Hall,

Cork, who evidently understands their every requirement. Messrs. Maekereth, Ulverston, and Barron contributed handsome shower bouquets. The gate was a huge success, the takings amounting to over £200, a great tribute to the untiring energy of the joint hon. secretaries, Messrs. G. Maekereth and F. W. Poole, and their busy committee.—R. P. R.

### Manchester, July 11th.

A brilliant exhibition of Roses was opened in the Botanical Gardens, Old Trafford, on Saturday last, and competition was great in every class. The leading one in the show was for sixty distinct kinds, no fewer than six competing, and the award fell to Messrs. R. Harkness and Co., Hitchin, for an extra fine collection. The striking varieties were White Maman Cochet, Ulster, Mildred Grant, Gustave Piganeau, Gladys Harkness, Dr. Andry, Mrs. W. J. Grant, La France de '89, Her Majesty, Bessie Brown, Niphotos, Papa Lambert, Mrs. J. Laing, Mdme. Hoste, Mrs. E. Mawley, Duchess of Portland, Countess of Caledon, Lady Mary Fitzwilliam, and Medea. Scarcely less excellent were the second prize set from Messrs. Alex. Dickson and Sons, which contained some exquisite new seedlings, notably Dr. Davison, a bloom of splendid texture and colour (dazzling scarlet, shaded deepest crimson); H.P. William Shean, a huge flower, deeper than Caroline Testout; and Dean Hole, a fine formed, pointed flower of a richer shade than Mrs. Mawley; also Mildred Grant, Mrs. D. McKee, Horace Vernet, Louis Van Houtte, Ernest Metz, and Mrs. W. J. Grant. The third went to Messrs. F. Cant and Co., Colchester, with somewhat uneven flowers.

No fewer than eight staged the thirty-six distinct, and here again R. Harkness led with a good all round stand, including Bessie Brown, Killarney, La France de '89, Ulster, Gladys Harkness, Lady Moyra Beauclerc, Papa Lambert, Frau Karl Druschki, and Jean Ducher being very prominent. In Messrs. Prior and Sons' second prize lot there were fine blooms of Tom Wood, Drusehki, B. Brown, M. Grant, and Ben Cant. Messrs. Alex. Dickson and Sons were a close third.

There were five for twenty-four Teas or Noisettes, and the judges must have had much trouble. F. Cant and Co. led, and had Mrs. E. Mawley, Souvenir de Pierre Notting, and Jean Ducher; Mr. G. Prince was very close as second, his flowers being superb; Messrs. D. Prior and Son made an excellent third.

For the twelve Teas or Noisettes, the claims of Messrs. Prince and F. Cant were almost in the balance, but the former won. For twelve any white or yellow Rose, Mr. G. Prince, out of a dozen entries, won with magnificent White Maman Cochet; R. Harkness, second, with Frau Karl Druschki. Twelve any light coloured, A. Dickson and Sons with grand Mildred Grant; J. Townsend and Sons, second, with Bessie Brown; and for twelve dark coloured, the King's Acre Nurseries, Ltd., first with A. K. Williams; and Hugh Dickson and Sons with Hugh Dickson.

The silver medal for the best H.P. or H.T. went to Mildred Grant from A. Dickson and Sons. For the best Tea or Noisette, Mr. G. Prince with White Maman Cochet.

The amateur classes were worthy of the highest encomiums, and the first prize twenty-four from E. B. Lindsell, Esq., Brearton, Hitchin, were extra fine. Muriel Grahame, Gustave Piganeau, Horace Vernet, Alice Lindsell, Frau Karl Druschki, Dr. Andry, and Her Majesty, standing out faultless. The Rev. J. H. Pemberton had pretty blooms, but lacking in weight, for second, Druschki, Vernet, and Ulster being typical; and Conway Jones, Esq. (a new exhibitor who met with a warm reception on making his debut in Manchester, was a fine third).

The same merit was again to the fore in Mr. Lindsell's first twelve; R. Foley Hobbs, Esq., Thorneloe, Gloucester, second; and R. Park, Esq., Bedale, third, the latter also gaining the victory for twelve Teas or Noisettes; Mr. Conway Jones, Gloucester, was second. Nor was any mistake made by the latter in annexing the first prize for eighteen Teas or Noisettes with flowers of clear colour, fresh, and well blended. The best were Medea, Maman Cochet, Comtesse de Nadaillac, Innocente Pirola, and Souv. de S. A. Prince. Second (very good), R. Foley Hobbs, Esq.; and third, R. Park, Esq.

The best light coloured Rose was Bessie Brown from R. Park, Esq.; the best white or yellow, again Bessie Brown, from the Rev. J. H. Pemberton; and the best crimson, Gustave Piganeau, from the same gentleman.

The distinct grown Roses were not well represented, but great credit is due to C. Burgess, Esq., Knutsford, who saved the situation with exhibits which were highly creditable in every way, his scoring being for twelve and two sixes. R. Hall, Esq., followed in each case.

Four competed for twelve bunches of buttonhole Roses, Mr. J. Mattock winning with a clean lot of unnamed flowers; Mr. G. Prince second.

For a display of Roses it was difficult to see how Mr. J. Mattock won, the stand for third place from Mr. G. Prince being remarkably fine in every way, and strictly keeping to the wording of the schedule. Messrs. J. Townshend's Crimson Rambler was refreshing in the second stand.

The work of Messrs. Perkins and Sons is so well known that

comment is useless. They had a charming basket of three bouquets.

For the best collection of Sweet Peas, Mr. J. Derbyshire staged some magnificent flowers, and also won for the collection of twelve. Mr. T. Smith won for not less than twenty-five varieties. Messrs. Jones and Sons, Shrewsbury, staged a grand and effective collection of 100 vases of the most superior varieties, and were deservedly awarded a silver-gilt medal.

Messrs. Caldwell and Sons, Knutsford, had a very choice table of miscellaneous plants; Mr. J. Williamson, Stretford, a huge *Lilium auratum*; and *Violas* well set up from Messrs. W. L. Pattison and J. Pilling, Hyde.

The luncheon was attended by a large company, amongst whom were Alderman Gibson, J.P., in the chair, supported by Mr. Tait and James Brown, Esq., with Councillors Duckworth and Robinson, of Stretford. The usual loyal toasts over, Councillor Robinson, as chairman of the Stretford Urban Council, referred to the treaty which is about to take place for their Council to acquire and work the future of the gardens. He referred to the good work done, and stated that they were determined not to lose the gardens to the people of Manchester, and that with the helping hand they could give, he hoped to see future shows go on to greater prosperity. Messrs. Conway Jones, Prior, Rev. J. H. Pemberton, J. Brown, and R. Pinnington (for the Press), also spoke in support. To Mr. J. Brown, president, Mr. J. Weathers, and Mr. Paul, the thanks of all exhibitors is fully due for their courtesy.—R. P. R.

### National Sweet Pea, July 15th and 16th.

For three weeks prior to the show, which we detail herewith, we learnt from Mr. Horace J. Wright, the honorary secretary, that entries were numerous, and the prospects bright for a good show. With the warmth and fulness of sunny days, and a moisture-laden soil, we have seen the Sweet Peas advancing at a rapid pace, till to-day they are, perhaps, absolutely at the crown of their perfection. Though frail and "thin," this lovely blossom furnishes a really charming exhibition en masse, and one might even say that when correctly staged, as Messrs. Jones and Sons, Dobbie and Co., or Henry Eckford stage it, no flower appears so light, elegant, graceful, or more pleasing. Of course, the common Cornflowers and the Shirley or Iceland Poppies vie with the Sweet Peas in some ways, yet the fragrant *Lathyrus* commands the greater respect. Times and again we have suggested the inclusion of the Poppy genus with the Sweet Pea, as fit material for the consideration of the grave and learned seigneurs who have undoubtedly assisted the trade in Sweet Peas, and cultivators towards a better knowledge of this flower; and it lies with the members to say whether or no they will broaden their platform. One can even dare to suggest that the Poppies are the more worthy subjects of study, and afford a much greater variety of interest. The exhibition this season—the third in sequence—was brought to a hall at Earl's Court, where the International Fire Exhibition furnishes one of the leading London attractions till next October. Visitors who entered by the Warwick Road portals had to pass the Sweet Pea show, which thus formed an extra feature of the Earl's Court season. Exhibitors, too, had the freedom of the fascinating gardens, and the halls and courts of the extensive grounds here, and if the Sweet Pea show continues to be held here, it is likely to increase in popularity when the venue becomes better known to gardeners.

Already the flower has attached to itself a number of almost exclusive devotees, just as the Rose, the Dahlia, Carnation, and Chrysanthemum have done, and we note the names of these in our report. The entries numbered roughly a thousand, and no other flowers (except some Crimson Rambler and other Roses) were seen. The first class on the schedule was for a collection of nineteen sorts, "to bring into prominence the finest varieties in the several colours." In all there were three dozen classes, and prizes were presented in the best of these by various trade firms, and by the officers and members of the society. The following is the prize list:—

**CLASS 1, SPECIAL CLASSIFICATION CLASS (OPEN TO ALL).**—The leader was Mr. C. W. Breadmore, 120, High Street, Winchester, with Coccinea, Hon. Mrs. Kenyon, Black Knight, Gracie Greenwood, Navy Blue, Dorothy Eckford, Geo. Gordon, Lottie Eckford, Miss Willmott, Prima Donna, America, Dorothy Tennant, Lord Rosebery, Duchess of Sutherland, Jeannie Gordon, Duke of Westminster, Princess of Wales, Salopian, and Lady Grisil Hamilton. The second place fell to Mr. Mark Firth, Wistow Hall, Leicester; third to Mr. A. G. Haryman (gardener, Mr. Acland), Apsford House, Frome; and fourth, E. W. King and Co., Coggeshall, with good flowers, but poorly staged. Surely if the flowers are worth trouble in culture, attention should be given to stage them to advantage.

**CLASS 2, THIRTY-SIX BUNCHES.**—Mr. Mark Firth here led with bright bunches, including Lord Rosebery, America, Agnes Johnson, Lady Mary Currie, Emily Eckford, Blanche Burpee, Countess of Radnor, Lottie Hutchins, Gorgeous, Navy Blue, Mrs. Eckford, Her Majesty, Jeannie Gordon, Shahzada, Monarch, Prince Edward of York, Gracie Greenwood, Lottie Eckford, Captain of the Blues, Salopian, Hon. Mrs. Kenyon, Triumph,

Colonist, Princess of Wales, Duchess of Sutherland, Lady Grisil Hamilton, Miss Willmott, Coccinea, Black Knight, Dorothy Eckford, Duke of Westminster, Countess Cadogan, Prince of Wales, Countess of Lathom, Lovely, and King Edward. Mr. Leonard Brown was second, Mr. Breadmore third, and E. W. King and Co. fourth.

**CLASS 3, TWENTY-FOUR BUNCHES.**—Messrs. Jones and Sons, Shrewsbury, were first, with a good set; Mr. Breadmore second; third Mr. Brown; and fourth E. W. King and Co.

**CLASS 4, TWELVE BUNCHES.**—Messrs. Jones and Sons, Shrewsbury, first, with good strong flowers; second, Mr. Breadmore; and third, E. W. King and Co.; the fourth falling to Mr. Leonard Brown, Brentwood.

**CLASS 5 (TRADE EXCLUDED), THIRTY-SIX BUNCHES.**—Mr. A. G. Hayman (gardener, Mr. F. Acland), Hapsford House, Frome, was first; Mr. G. H. Baxter (gardener, Mr. Holloway), Hutton Park, Brentford, second; and Mr. H. J. Michels (gardener, Mr. Hughes), Farleigh House, Kingston, third, out of four entries.

**CLASS 6, TWENTY-FOUR BUNCHES.**—Mr. A. F. Wootten, College Road, Epsom, first; Mr. Michels, second; Mr. R. Bathurst, third; and fourth, Mr. J. G. Ward, High Street, Brentwood.

**CLASS 7, TWELVE BUNCHES.**—There were eleven entries here, Mr. H. Aldersey leading; second, Mr. T. Lloyd Davies; third, Mr. H. J. Meyer, The Grange, Harlow; and fourth, Mark Firth, Wistow Hall, Leicester.

**CLASS 8, NINE BUNCHES.**—Mr. Aldersey, first; A. Steer, Royston Park, Pinner, second; Miss Beckford, Oxford House, Ham Common, third; and Mrs. Brewer, Suffield House, Richmond, fourth, out of seven entries.

**CLASS 9, SIX BUNCHES.**—Mrs. Brewer first; Mr. S. F. Jackson second; Miss Beckford third; and Mr. M. Y. Green fourth.

**CLASSES 10 TO 28 (OPEN TO ALL),** each for two bunches of Sweet Peas, in distinct colours. **WHITES.**—Mr. Breadmore led with Sadie Burpee and Dorothy Eckford; second, Hugh Aldersey, Chester; third, R. Bathurst, Tron Acton, Glos.

**CRIMSON.**—Mr. Breadmore first with Salopian and Mars; second, Miss Beckford, Ham Common; third, Mrs. F. Brewer, Richmond.

**YELLOW AND BUFF.**—Again Mr. Breadmore was first, with Hon. Mary Ormsby Gore and Hon. Mrs. Kenyon; second, Hugh Aldersey; third, F. Brewer.

**PINK.**—Mrs. F. Brewer led with Lovely and Prima Donna; second, Mr. T. Lloyd Davies, Park House, Addlestone; third, M. Y. Green, The Lodge, Eynsford.

**ROSE AND CARMINE.**—Mr. Breadmore first with Lord Rosebery and Prince of Wales; second, R. Bathurst; third, Mrs. F. Brewer.

**MAUVE.**—Mrs. Brewer, the varieties were Admiration and Dorothy Tennant; second, Mr. Breadmore.

**BLUE.**—Mr. Breadmore led with Countess Cadogan and Navy Blue; second, Mrs. F. Brewer; third, Mrs. A. Tigwell, Southall.

**ORANGE.**—Mr. Breadmore, with Miss Willmott and Lady Mary Currie; second, H. Aldersey; third, R. Bathurst.

**BLUSH.**—Mr. Breadmore, with Duchess of Sutherland and Modesty, beat Mr. H. J. Michels, Kingston.

**PICOTEE-EDGED.**—Hugh Aldersey, foremost with Maid of Honour and Golden Gate; second, Mr. Breadmore.

**STRIPED AND FLAKED ROSE AND RED.**—Mr. Breadmore, with America and Gaiety; second, Mrs. Brewer; third, H. Michels.

**FLAKED BLUE AND PURPLE.**—C. W. Breadmore, with Grey Friar and Princess of Wales; second, H. J. Michels.

**BICOLOR.**—Mr. Breadmore, with Triumph and Prince Edward of York; second, Mrs. F. Brewer; third, H. Aldersey.

**VIOLET AND PURPLE.**—Mr. Breadmore, with Duke of Westminster and Duke of Clarence; second, H. Aldersey; third, H. J. Michels.

**MAROON AND BRONZE.**—Mr. Breadmore, with Black Knight and Borcaton; second, Mrs. F. Brewer; third, Miss Beckford.

**LAVENDER.**—Mr. Breadmore, with Lady Grisil Hamilton and Lady Nina Balfour; second, H. Aldersey; third, H. J. Michels.

**FANCY.**—Mr. Breadmore, with Lottie Hutchins and Gracie Greenwood; second, Mr. T. Lloyd Davies; third, H. J. Michels.

**MAGENTA.**—Mr. Michels, with Captivation and Geo. Gordon; no other entry.

**CERISE.**—Mr. Breadmore, with Coccinea, two bunches; second, T. Lloyd Davies; third, H. J. Michels.

For two bunches of Everlasting Peas Miss A. F. Harwood led, and Mr. A. Taylor, East Finchley, second.

Miss C. J. Cole beat Jones and Sons for the wreath or cross, she having a wreath; and Jones a cross. For an epergne seven contested, and the honours fell thus: Miss C. J. Cole, Dorothy M. Oliver, Jones and Sons, and Adelaide F. Harrow, as named. For a basket arrangement Miss C. J. Cole was first, and Miss Harwood second. For a bouquet Jones and Sons beat Miss Harwood; and third, Miss C. J. Cole.

For a dinner table decoration (class 29), Mrs. Rapler, St. John's, Withdean, near Brighton, led; Earl Speneer (gardener Mr. Silas Cole), Althorp Park, Northampton, was second; Miss

M. M. West, Sutton, Surrey, third; and Mrs. Gentle, Little Gaddesden, fourth, out of eight entries.

Class 30 brought six tables, and Miss Cole was first, the others in order being Jones and Sons, Dorothy M. Oliver, Tollington Park, N.; and Adelaide F. Harwood, Colchester. The tables were all very tasteful.

NON-COMPETITIVE EXHIBITS came from Mr. Charles W. Breadmore, Sweet Pea specialist, Winchester, who had King Edward VII., Dora Breadmore (tea-pink), Dorothy Eckford, and all the best known and prized sorts.

Henry Eckford, of Wem, sent as usual, a lovely contribution staged to perfection, the newer varieties being Scarlet Gem, the finest Sweet Pea of its colour, a bold, strong, showy flower; King Edward VII., a large crimson; Mrs. W. Wright, purple-violet; Gracie Greenwood, and Dorothy Eckford.

Messrs. Cannell and Sons contributed a fine display, with the Cupid section in front. E. W. King and Co., of Coggeshall, Essex, who have "seven acres growing for seed," were also present; and Jones and Sons, of Shrewsbury, also set up a collection. Added to these were Hobbies, Ltd., Dereham, with a gorgeous selection of Roses, Carnations, and Sweet Peas; while Dobbie and Co., of Rothesay, had a select group of new sorts. Among these were Mrs. C. H. Curtis, pink; Florence Molyneux, a very good white, with purple flaking; Miss Willmott, Gracie Greenwood, American Queen, Jessie Cuthbertson, Dorothy Eckford, and Dainty.

MEDAL AWARDS.—The following medals were given for non-competitive displays: Large gold, Hobbies, Ltd.; gold, to Cannell and Sons and C. W. Breadmore; silver-gilt to H. Eckford, Dobbie and Co., and Robert Sydenham; large silver to Jones and Sons; silver to E. W. King and Co.

NEW VARIETIES.—The certificates had not been awarded when we left at two o'clock. The following seemed the most meritorious of the novelties:—

Bolton's Pink, from R. Bolton, of Walton, Carnforth.

Florence Molyneux, from Dobbie and Co. (see report).

Gladys Unwin, a wavy petalled, soft lilac-pink, from W. J. Unwin, Histon, Cambs.

King Edward VII., a grand scarlet-crimson, from Henry Eckford.

Miss Delia Spencer, a strong carmine-cerise, from Mr. Silas Cole.

Scarlet Gem, the finest of the set, from Henry Eckford.

### Sheffield Floral and Horticultural.

At the monthly meeting of this society there was a good muster of members, and Mr. T. Lucas, of Ashgrove Gardens, gave a very interesting and lucid essay on the "Begonia," with special reference to Gloire de Lorraine. Amongst the exhibits were a splendid collection of cut blooms, some lovely Passifloras, and a grand piece of Dendrobium suavisimum carrying ninety-seven blooms, staged by Mr. Topham, gardener to Alderman J. Smith, for which a cultural certificate was awarded. The secretary announced the progress and prospects with regard to the annual show, and appealed to the members to use their efforts in making this a first-class exhibition. The Duke of Norfolk will open the show. The Lady Mary Howard, Lady Wilson, and Mrs. S. Wilson will judge children's vases and the bouquets; Mr. Nelson, of Chesterfield, and Mr. Wagg, of Ossington, will judge in the open classes; and the president, S. Roberts, Esq., M.P., will be supported at the opening by the Lord Mayor and the Master Cutler, so that a fashionable attendance is expected.

### Liverpool Amateur Gardeners.

The usual monthly meeting was held in the Common Hall, Hackins Hey, on Thursday last, Mr. A. W. Ardran presiding over a numerous attendance, who listened with evident satisfaction to the paper entitled "Raising Crops and Plants," which was read by Mr. J. Stoney, gardener to F. H. Gossage, Esq., Camp Hill, Woolton. Mr. Stoney's remarks were admirably fitted to the taste of his audience, and in simple but most practical language he detailed the methods best suited to bring about the highest results, the audience at the close unanimously passing a hearty vote of thanks. The exhibits were more fully represented than usual, Miss Davies taking the prize for a very charming basket arranged for effect, also for the best spray of flowers, Mrs. Stevenson keeping up her reputation in the Fuchsia class. Mrs. Robins had good double Potunias, whilst Mrs. Paddock secured both Rose classes with good examples considering the season. Owing to the severe weather there were no Sweet Peas, but outdoor flowers were staged in good form by Mr. Wallace. Carnations from Mrs. Paddock, Zonal Pelargoniums from Mr. Hitchmough, a capital Begonia from Mr. A. Dodd, and a superior collection of miscellaneous cut blooms from Mr. Hitchmough completed a very fine display. Next month's show will be looked forward to with much interest owing to the numerous classes provided.—R. P. R.

### Metropolitan Public Gardens Association.

Writing from 83, Lancaster Gate, W., the Earl of Meath encloses a copy of the latest report of the Metropolitan Public Gardens Association, of which he is the chairman, containing a special map of London showing the work since 1883. Lord Meath hopes that should the subject be of interest to readers of this journal some may feel disposed to become members of the association, or to contribute a donation to its funds. In the former case, the only liability is an annual subscription. The Association is much in need of help at the present time, as its income has been very adversely affected by the late war and other allied causes. That branch of the work of the association which deals with the provision and laying out of public gardens and playgrounds in poor and crowded districts brings health and happiness to the inhabitants, and tends to beautify their dull surroundings. It also affords employment, especially during the winter months, to deserving men, who might otherwise be out of work. The association has many useful schemes on hand which it is ready to carry out if sufficient funds are forthcoming.

### East Anglian Horticultural Club.

The monthly meeting of the East Anglian Horticultural Club was held on the 8th inst. at the Shirehall Hotel, Norwich, when Mr. Geo. Davison, The Gardens, Westwick House, gave an interesting address on herbaceous plants, and showed in connection therewith a magnificent collection of cut flowers. A very fine collection of Marguerites (six varieties) and Poppies was shown by Mr. Holmes, of Tuckswold Farm. The winners of the monthly competitions were Messrs. Chettleburgh, G. Moore, C. H. Hines, C. Matthews, G. Elsey, S. Hunt, C. Burtenshaw, F. Williams, A. Craddock, E. C. Ramus, D. Howlett, T. Notley, Rush, Fox, and Palmer. There was only one entry for the prize presented by Mr. E. Peake, for the best collection of six wild flowers, correctly named, and the first prize was awarded Mr. H. B. Dobbie. With regard to the Boardman silver flower bowl competition, Mr. C. H. Hines was awarded twenty-one points, and Mr. F. Carrington sixteen points for six bunches of annuals. The bowl is competed for by single-handed gardeners and the amateur section of members, and the competitor securing the greatest number of points at the end of the year secures the prize. Mr. J. E. Barnes' prizes for the three best specimens of Barnes' Giant White Cos Lettuce were taken by Mr. F. Carrington and Mr. D. Howlett, and points were awarded Messrs. C. H. Hines, W. Rush, C. Matthews, C. Burtenshaw, and A. Craddock in the competition for the silver flower bowl presented by Mr. Tillett, which has to be won two years in succession to become the absolute property of the exhibitor.

### Devon Gardeners'.

The annual outing of the Devon and Exeter Gardeners' Association to Ilfracombe took place on July 8, which was a charming day. How we enjoyed ourselves ourselves at Ilfracombe-cum-Berry! Mr. James Turner, the head gardener, showed the excursionists over the grounds. Then Mr. Basset and his son-in-law, Captain Curzon, were at the gymkhana at Barnstaple, but Mrs. Basset gave the party a welcome through the hon. secretary (Mr. Andrew Hope) and the hon. treasurer (Mr. Mackay), who shepherded their large flock throughout the day. Standing on the top of a battlemented wall Mrs. Basset said, "I wish you all a very pleasant day," and a hearty cheer was given in acknowledgment. The hilly nature of North Devon afforded capital sights to the party, and some of the local tints and far distance scenes were commented on by Mr. Turner. Mrs. Curzon accompanied the visitors, showing with zest everything worth noting, for she is a great gardener. Mrs. Curzon and the head gardener are transforming an old sheltered fruit and vegetable garden, sloping to the stream and pond, into a beautiful pleasure ground. The party passed on to an ornamental series of terraces, among which were two of the finest specimens in the county of the nobilis variety of bamboo (Phyllostachys), throwing up their clusters of slender stems from an islet in the midst of a pond dotted with Water Lilies. Japanese Maples and many fine things were noted. After visiting Combemartin and Berrynarbor (the latter place a delightful study for artists), Mrs. Basset's guests made a happy return to what they call the "ever faithful" city of Exeter about 10.30 p.m.—X.

### R.H.S. of Ireland.

The Rose show at the Pavilion, Kingstown, was quite a new departure of the Council of the Royal Horticultural Society of Ireland, one, we should say, which would become popular, as it would be independent of weather, there being ample space inside to exhibit the flowers to perfection. It was not a very good show of Roses, if quantity was desired, as the weather was against them everywhere, but the few that were exhibited were, indeed, very lovely and perfect. Messrs. Dickson, of New-

towards and Dublin, took first prize and many others. Messrs. Ramsay had some charming plants and hardy annuals. Hogg and Robertson had their usual fine show of Irises and other bulbous plants that take up the running at Rush when the Tulips are things of the past. Lord Plunket again sent a splendid show of herbaceous plants, which at all seasons of the year form one of the delights of the Old Connaught Gardens.

### Co-operative Flower Show, Crystal Palace, July 11th.

The Agricultural and Horticultural Association having in 1902 abandoned the large flower show they had been in the habit of holding at the Crystal Palace for several years in connection with the festival of the National Co-operative Society, the organisers of the festival arranged one on quite a small scale last year; and this year they considerably extended it, and three of the Egyptian courts were filled with exhibits generally of a highly satisfactory character. Mr. Henry Vivian was the chairman, and Mr. George Morriss the secretary; and a body of assistants, with Mr. George Castleton at their head, arranged the exhibits in due order. Judging was got through early, and the flower show courts were visited by thousands of interested co-operators from all parts of the country. It is the intention of the promoters to extend this exhibition in the future, and it is not improbable that in the course of two or three years it will attain to former dimensions.

The schedule of prizes of sixty-two classes was divided into three sections; the first section open to all comers; the second to professional gardeners and members of co-operative societies; and the third section also to members not professional gardeners. While there was nothing particularly striking, the general average was decidedly good. Among plants, Zonal Pelargoniums (double and single), Fuchsias, Petunias, Coleus, Musk—represented by finely grown and flowered plants of Harrison's, and annuals were all creditable; in the case of the latter, Calliopsis coronata, the lavender-blue Convolvulus minor, dwarf Schizanthus, and Mignonette were among the best.

Cut flowers included Sweet Peas, which were numerous and in some instances finely shown. Roses, some decidedly good; annuals and hardy flowers in bunches, and various floral decorations. Fruit was shown by professional gardeners; there were good Strawberries and Currants; while vegetables were shown in collections and dishes, some of them particularly good. Special prizes were offered for flowers and vegetables by various branch co-operative societies.

A large collection of flowers, &c., was shown by Messrs. J. Cheal and Sons, nurserymen, Crawley, and from Smith's Nurseries, Crown Hill, Upper Norwood, to both of which a Co-operative Festival certificate of merit was awarded. Mr. W. J. Unwin, florist, Heston, Cambs, exhibited a number of sprays of his new Sweet Pea Gladys Unwin, a flower of excellent parts, which may be popularly described as a pink Miss Willmott. It was awarded a certificate of merit for its undoubted good qualities.

### Scottish Horticultural.

The monthly meeting of this association was held in Dowell's Rooms on the evening of Tuesday, the 7th inst., Mr. McHattie, president, in the chair. There were a large number of members present; a number of new members were elected. Mr. Dick, Champfleurie, furnished a paper, which was read by the secretary, on "My Favourite Flowers, and Soils that Suit Them." Mr. Dick's paper was well written, though rather discursive in its nature. Mr. Dick dealt shortly but lucidly on a great variety of flowers and plants, such as the Rose, Lily, Rhododendron, Cyclamen, Eucharis, Lilac, Cratægus, &c., making short cultural remarks on each. An interesting discussion followed, and a hearty vote of thanks was awarded to Mr. Dick.

The exhibition table was gay with a large number of interesting subjects. Messrs. Dickson and Co. sent a number of nice plants of Kalanchoe flammula, for which a certificate of merit was awarded. Mr. John Downie, Beech Hill Nurseries, exhibited a handsome vase of double white Rocket in fine robust form. Messrs. Todd and Co., Shandwick Place, sent a beautiful vase of perpetual blooming Carnations, among them being Cambridge White, Royalty, Dazzler, and Madame Melba, a beautiful pink. These were remarkable for decorative value and splendid long stems. Mr. Kidd, The Gardens, Carberry Tower, exhibited a splendid vase of pink Malmaison Carnations, the rich scarlet Mrs. E. Hambro', and crimson Uriah Pike. These were really very fine specimens of high cultivation, and were deservedly awarded a cultural certificate. Messrs. Grieve and Sons, Redbraes Nurseries, had a nice exhibit of fancy Pansies and bronze shaded Violas; also a number of beautiful hardy flowers. Nice blooms of Brugmansia were sent by Mr. Comfort, Broomfield Gardens. A pair of well grown Gloxinias were sent from Mr. Waldie Lamont, Colinton Road, which were awarded a cultural certificate.

On the motion of the president it was agreed to send a formal vote of thanks to Mr. Stewart Clark, of Dundas Castle, for his great kindness and hospitality on the occasion of their visit to his beautiful gardens and grounds.

### Fruit Forcing.

**VINES: IN POTS FOR EARLY FORCING.**—The canes for starting the first week in November, to ripen the fruit in March or early in April, should by this time have completed their growth, and must not have any more water than will prevent the foliage from becoming limp. Expose fully to light and air, so as to thoroughly ripen the wood and the buds. If the laterals have been allowed to extend with a view to thickening the cane, they must be brought back gradually by cutting away part at a time, reducing each by degrees to one leaf. The Vines should be kept free from insects, syringing occasionally if red spider appear, for it is important that the leaves perform their functions. When the wood becomes brown and hard, place the Vines on a board or slates in front of a south wall, securing the canes to the surface to prevent the foliage being damaged by wind. Afford water only to prevent the leaves flagging, cut away the laterals close to the cane, and in a few days shorten the cane to the length required. The principal leaves must not be injured, but left to die off naturally. The best varieties for early forcing are White Frontignan, Foster's Seedling, Black Hamburgh, and Madresfield Court.

Later Vines in pots should be encouraged to make a good growth and perfect it, also exposed to all the light and air possible. They must not be over-watered, nor neglected for due supplies of water or liquid manure. Cut-backs are much the best for early forcing, as the Vines make an earlier and sturdier growth and perfect it sooner than those raised from eyes in the early spring. This is important, for the Vines have more rest, more stored matter, and start with greater regularity.

**EARLY FORCED PLANTED-OUT VINES.**—It is not advisable to force Vines year after year to ripen their crops before May or June, and houses which are started in December or at the new year to afford Grapes at the time mentioned for table or marketing respectively are best planted with varieties that ripen together, the structure being only of sufficient size to admit of a supply of ripe fruit for a period of not more than six to eight weeks. This is as long as black Grapes will hang under a May, June, and July sun without turning red, or white Grapes from becoming brown on the exposed side of the bunches, even when a slight shade is afforded from sun. Such arrangement admits of the foliage being cleansed with water from a syringe or engine, but when there are late as well as early varieties in the same house the dry atmosphere that must be maintained on their account when the Grapes are ripening causes red spider to increase on the foliage, and this is very disastrous to present and future crops of Grapes.

Early Vines that ripened their crops in May or early in June will soon be cleared of Grapes. They should be thoroughly cleansed, employing an insecticide if necessary, and the foliage be preserved in health as long as possible by occasional syringing, full ventilation constantly, and due supplies of water or liquid manure at the roots.

**MUSCATS RIPENING.**—Unless the season is exceptionally fine, and the Vines started early, Muscats require fire heat to ensure their perfect maturation, even when ripening at the hottest part of the year. The time taken by Muscat of Alexandria to ripen is not less than six to eight weeks from commencing to colour, especially when the Vines are in vigorous health. Perfect finish in extra fine Grapes is not had for some time longer; they require time, with assistance from fire heat, so as to secure a night temperature of 65deg to 70deg, 75deg to 85deg by day up to 90deg or more, with abundance of air. A rather dry atmosphere is essential to attaining that golden hue characteristic of rich and full Muscat flavour. This is secured by free ventilation, a little constantly, but the atmosphere must not become arid, damping down occasionally. In large houses the moisture arising from the border is enough except in hot weather, then the paths and borders should be damped daily. Too much moisture is fatal to Muscats when ripening, causing them to "spot," therefore it is necessary to have a gentle warmth in the hot water pipes, and a little air constantly to prevent the deposition of moisture on the berries. Abundant supplies of water must be given to the roots, for when there is a deficiency of moisture the Grapes shrivel. On the other hand, excessive supplies, so as to make the soil sodden and sour, results in shanking of the berries. Needless waterings, therefore, should be avoided, also dribbles, mere wetting of the surface, very ineffective, doing quite as much harm as good, besides being deceptive of the right indication of the soil beneath as regards moisture.

**YOUNG VINES.**—Canes planted this season should, provided they are to be cut down to the bottom of the trellis, leaving

three buds there for the continuation of the rod and two shoots for bearing next year, be allowed to grow unchecked, so as to secure a good root formation and sturdy stems. Any Vines intended for producing full crops next season on the extent considered sufficiently stout in rod should have the laterals issuing from the side of the buds to which they are to be shortened, stopped to one leaf, and the principal leaves kept free of growths. If permanent Vines the cane need not be stopped till it has grown to the top of the house, cutting back at the winter pruning to three good buds from the bottom of the rafter or trellis, and only allowing the side growths to bear each a bunch of Grapes in the second year to prove the variety, taking the leading growth forward without cropping. Supernumeraries intended for next year's bearing and then to be removed should be stopped at a length of 7ft to 9ft, pinching the laterals to one leaf and sub-laterals in like manner. These ought to be shortened in September, and by degrees cut away close to the cane, and in a fortnight afterwards the Vines should be pruned to the first plump bud below the first stopping, leaving the old leaves to die off naturally. Thorough ripening of the wood is important, a free circulation of air being necessary, with fire heat if the weather be cold and wet.—ST. ALBANS.

### Kitchen Garden.

**OUTDOOR TOMATOES.**—Growth is now strong and active, and the flower trusses are being produced freely and in succession on the main stem. If all goes well with the plants the pollen should be liberally produced as the blooms fully open. A slight shake or movement of the blooms will distribute the pollen readily in the middle of the day, and there will naturally follow a free setting of fruit which, under favourable conditions, will readily swell. It is at this time that constant attention is required. The water supply must be regular, so that the roots do not suffer, or the flowers will be likely to drop, and probably the fruit, soon after it has set. Serious checks are often given to the plants by the water supply being ineffective. On the other hand, too much water must be avoided. Another matter to guard against is allowing superfluous growths to remain, which crowd and destroy the chances of a prolific condition. Commence with and continue to train the plants to one stem. When a fair amount of fruit has been secured small doses of liquid manure may be afforded to assist in swelling the fruit, and maintaining the general vigour. It is, of course, an essential of success that Tomatoes should only be planted where they are fully exposed to sun and air.

**MELONS IN FRAMES.**—Air, light, and warmth are the chief requirements of Melon plants, together with adequate moisture at the roots. The latter may be mainly secured by planting in a good holding soil which does not, of course, retain water too long. Warmth in the early stages must be maintained either by fermenting material or by hot water pipes running round the frame inside. Sun heat must be largely utilised, too, in frame culture, closing early in the afternoon to have the benefit of it, but judgment must be used at this season. In a sunny position there will always be plenty of light, while air may be given in sufficient quantity by regulating the lights of the frame. Train the growths thinly, whereby they will develop substance and be short jointed, with leaves of corresponding quality. Fruits form on short side growths, and the aim must be to have a certain number of blooms opening at one time, fertilising them all on the same day. The fruits setting will then swell together, and be equal in size, or it may be possible from the number set to select a limited quantity equal in size. All others should be removed, and the selected ones encouraged to grow freely. Stop the shoots at a joint or two beyond the fruits. Give air early in the day according to the weather. The water supplied to the roots must be given at the same temperature as the frame. As the fruits swell to a good size, place them on a square base of wood, and as they become larger, elevate them close to the glass. A space of several inches immediately round the main stems is best kept dry, so as to avert an attack of canker. If signs of it do occur rub in quicklime or fine charcoal.

**PLANTING WINTER GREENS.**—The principal crops of Borecole, Savoys, autumn Cabbage should now be planted. If inserted in dry weather water or liquid manure must be given them. The rows ought not to be less than 2ft. apart, and the plants 15in. to 18in. Some good reliable varieties of Broccoli ought also to be planted, choosing for them a plot of firm ground. Holes may have to be made with a crowbar to insert the plants, but they often make just the right sort of growth which will pass through the winter well. In order to assist in well establishing all winter greens, run the flat hoe between the rows frequently.

**LETTUCE.**—Cos Lettuces, which are approaching a full-grown condition, may have the leaves tied together in dry weather, so as to well enclose the hearts, and assist their blanching. Thin out seedlings. Further sowings should be made in watered drills. The earlier Lettuces which have commenced to run to seed ought to be pulled up without delay, their continuance impoverishing the ground.—EAST KENT.

## THE BEE-KEEPER.

### Autumn Stimulation.

During favourable seasons it invariably happens that the queen of a colony is stimulated to such an extent by the ingathering of honey and pollen as to completely occupy all the bars in the brood chamber with eggs and brood in all stages, to the exclusion of the honey, and the bees are therefore compelled to find room for the storage of the latter in the upper portions of the hive. Now, when it is remembered that the harvest is seldom of more than a fortnight's duration it will be evident that if the stock hive is full of brood at the beginning of the honey flow, it will from the same cause certainly remain so through the whole of the harvest, consequently the supers rapidly become filled, and the colony is considered an excellent one. When, however, the supers are removed, which does not usually take place until the season is over and the last pound of honey stored, what is to become of the bees so closely robbed of their surplus stores?

With the cessation of the harvest there will obviously be a diminished income, and the large quantity of the brood and bees, with their innumerable wants, will soon be reduced to a pitiable condition through the inadequacy of their food supply, causing many bees to perish through useless flights in search of food, in addition to the loss of the brood, which is cast out of the hive in times of scarcity. This state of things can be prevented by gentle, continuous feeding in the early autumn, which stimulates the queen, bringing out her best egg laying qualities.

The continuance of ovipositing is to the ultimate benefit of the stock and the apiarist, as it secures a considerable addition to the number of eggs, and as the brood which is already in the hive is also brought to maturity, there is a population of young bees for the winter. Breeding is discontinued naturally only through cold, wet weather, or when the income is very sparse; but no matter when the harvest ends, stimulative feeding should commence when the supers are removed, and should cease not later than the beginning of September, as should cold weather ensue the brood in the hive would run great risk of being chilled, and the bees would then be in a worse condition than before, through performing useless labour in connection with the brood. If stocks have been neglected, and breeding long discontinued, they cannot have too much attention paid to them.

Stimulative feeding should be resorted to at the earliest possible moment to promote breeding. There is another advantage in this method of feeding as soon as the supers are removed—that is, any excess of food is stored, and will be put into its natural position and properly sealed up without an undue proportion of moisture, which almost invariably happens when stocks have been fed up too rapidly late in the autumn. There is nothing gained by procrastination late in the season. As soon as the surplus is taken off, put on rapid feeders if short of food, and afterwards substitute slow ones, which should contain little more than what is actually required for the daily wants of the bees. This will have a stimulative effect, and will at the same gradually feed up for winter. It is becoming more and more widely appreciated that the maximum efficiency of colonies during the following season is only obtained by taking into account all the varied operations the previous autumn.

Plenty of bees must be secured for winter, which, apart from the work they accomplish in building up strength in the early part of the year, also effect an economy of stores, as the more numerous the inhabitants of the hive the better are they able to maintain the necessary heat during the cold months, without the increased consumption of food and mortality which numerical weakness entails. This again results in spring feeding to a great extent being obviated. Food is never lost.—E. E., Sandbach.

### Stray Thoughts on Hives.

When people only used straw skeps, they imagined that the oftener bees swarmed, the better their colonies were prospering. Unfortunately this idea still lives in outlying country districts, even in these enlightened days. Some of the more thoughtful of the above used to raise the hives, and do now, and let the bees work down into the lower chamber, and when the busy insects had left the upper hive, this sometimes seemed to check swarming. When bar-framed hives became known, it was said that, by giving more room above, by placing super above super, the bees had been deprived of their desire to swarm. Those who placed their whole faith in this doctrine know how far it came short of their hopes. Other hives were invented, all non-swarming, with no warranty, though, with room on the sides, but these proved only worse than the others.

Last year I had the good fortune to watch a double hive, something like a "Wells," which seems to have attained the object most bee-keepers have in view, viz., the prevention of swarming. As my observations only extend over one season, I could not undertake to say that it is absolutely a non-swarming hive, but it did not swarm last year, and the take for the year was phenomenal, considering the season, and far in advance of the

takes from other hives in the neighbourhood. The patentee, Mr. Geary, warrants this to be a non-swarming hive, and without a doubt it is far better than any other hive I have had an opportunity of observing, and well worth a trial.—HYBLA.

#### When to put on Supers.

One is constantly being asked, When ought I to place supers on my hives? This question seems a very simple one, but only general rules can be laid down for their guidance. Most people imagine that we have only to place on these supers and they are sure to be filled, but at the end of the season they tell a very different tale. They have learned something by experience, and the school of experience is perhaps the best of schools in which to learn. Note first the main source from which the honey is obtained. In one district it may be fruit, in others mustard, turnips, clover, lime trees or heather. Having settled this point, get the hives ready for the season; this means you must commence operations at least six weeks before. Then, when you see the white wax near the top bars put on the queen excluder and sections, wrap up well, and hope for the best. During a good season it is quite possible to have twenty-one sections filled in seven days. A friend of mine told me that he had sections filled in this period once, and they were the prettiest he had ever seen. Still, knowing this, don't be surprised if they take longer.

It may not be out of place to give a hint or two on the preparation of sections. Procure some boiling water and a small paint brush. Wet all the joints well, twenty-one sections at a time, placing them one on the other. When all of them have been well wetted, turn over the pile, and the first one operated on will be well soaked. It is best to use whole sheets of foundation. Many use only starters, but this is false economy. It takes the bees longer to complete their work, and the sections are rarely so well filled. Some time ago a lady bee-keeper remarked on well filled sections, and when told how they were secured, replied, "I cannot lower myself to do that, for the bees in time will lose the art of comb building."—HYBLA.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**SWEET PEAS FUNGOID (C. M. H.).**—My Sweet Peas have suffered during the last two years, but this year they are worse than ever. A large proportion of seeds have never come up, and if they survive to flowering time the blossoms are deformed and blurred in colour; the leaves yellow and curled up. I shall be grateful for any information.

[The Sweet Pea plants are affected in the leaves and stems by the Pea spot, *Aschyta pisi*, a parasitic fungus that causes pale spots on the leaves, stems, and even pods of cultivated Peas (*Pisum sativum*), Haricot Beans (*Phaseolus vulgaris*), Everlasting Pea (*Lathyrus sylvestris platyphyllus*, syn. *L. latifolius*), Sweet Pea (*L. odoratus*), and species of *Vicia* and *Cercis*. It forms pallid spots of a somewhat rounded or oval form on the leaves, and these quickly dry up and leave nothing but the stems on young plants, and greatly prejudice the growth of older plants so that they do not flower satisfactorily; indeed, the petals are affected, being more or less disfigured by pale dead spots, and sometimes they do not open, but shrivel up in the bud, seeding being very indifferent, and sometimes not any pods are formed. The parasite also attacks the stems, seldom below the surface of the ground, and then the part of the plant above the point of infection commonly collapses, drying up and withering of a pale colour. It is, however, most disastrous to the leaves, these having the pale spots, and the whole leaf or leaflet dries up of a pale colour. On the pale spots appear minute dark points or dots, though not always in the case of leaves that quickly shrivel. These dark bodies are the conceptacles of the fungus, and from these are discharged, when mature, the spores of the parasite by means of which the disease is spread, and the diseased leaves or stems also carry over the disease from year to year by means of perithecia that form in them during their dried state. Diseased portions, therefore, should be burned. No preventive means against this pest have been recorded. Probably spraying with dilute Bordeaux mixture or potassium sulphide solution, 1oz of the sulphide being dissolved in about a quart of hot water, and when dissolved adding 2½gals of soft water, in which 1oz of soft-soap has been meanwhile dissolved, thus making 2½gals of solution, when well mixed and cool, is ready for use. Spraying should

commence as soon as the plants appear above ground, and be repeated at intervals of ten days or a fortnight, so as to coat the leafage as made with the finest possible film of the solution. We did not find any trace of disease on the roots, though the cuticular tissues had become brown in some cases, and there was no evidence of eelworm in the root stem. Possibly the disease may go over in the seed, as it affects the pods and probably the seed, as you mention that some of the Peas never come up, for which, however, the seedsmen are not responsible, only in that they should be careful to save seed only from healthy plants. The Sweet Sultan also had the foliage shrivelled up, and appears affected by a similar disease, but we did not discover the fruits of the fungus, which are essential for definite identification. The soil appears deficient in lime, otherwise of a nature calculated to grow Peas and other crops satisfactorily. As there was trace of "sleeping disease" in the Sweet Sultan root stem, we advise the ground to be dressed in the autumn, or some time in advance of cropping, with a mixture of eight parts basic cinder phosphate and three parts kainit, applying 1lb. of the mixture per square yard, and digging in, taking small spits so as to mix evenly with the soil. In the spring, or before sowing or planting, again fork over the ground, and probably you will not be troubled with the collapse of either the Sweet Peas or the Sweet Sultan plants.]

**DWARF CHRYSANTHEMUMS (S. W.).**—Sturdy, healthy cuttings grown in the full sun, inserted now in small pots of sandy soil, stood on damp ashes in a frame, kept moist, close, and shaded to prevent the leaves flagging, strike readily, and the plants are often very serviceable for various decorative purposes. The cuttings and young plants cannot have too much light and air consistent with keeping the foliage fresh. Thousands of dwarf plants of pompon varieties are raised from cuttings inserted in July and August.

**BOOK ON FORESTRY (Geo. S.).**—We are not acquainted with the book you name, and cannot say where a copy is obtainable. You might write, stating your wants, and asking for a catalogue of their books, to either of the following: Wesley and Son, Essex Street, Strand, W.C.; or Morgan and Co., 8, St. Mary-at-Hill, E.C. We can recommend to your notice "The New Forestry," by J. Simpson, 2s. 6d. (Pawson and Brailsford, Sheffield), as a good, suggestive work. You will find occasional forestry work in our own columns, also in the "Gardeners' Chronicle," London; "The Garden," London; "North British Agriculturist," Edinburgh; "The Field," "Flora and Sylva" (2s. 6d. monthly), and other periodicals. We do not know a journal of forestry. There was a Scottish arboricultural paper, but it failed.

**VARIETIES OF BLACK HAMBURGH GRAPE (W. A.).**—The best variety of Black Hamburgh is undoubtedly Mill Hill, which has the fine appearance of Dutch Hamburgh, but without the coarseness and hollowness at the centre that characterises that form, and the quality is equal to that of the Black Hamburgh; the latter is, however, excellent, and as a rule grows better than the Mill Hill. By planting the Vines now you will take time by the forelock—i.e., get them established, and they will be in a condition to make a good start when the house is closed in February. It is only a question of shading until the Vines recover from the partial disentangling and spreading out of the roots in the fresh material, afterwards exposing the growth fully to light so as to get the wood ripe. Cut hard back, and they will start well with the other Vines. It would be preferable to plant at once than defer it until the house is started in February.

Fine warm weather, with a rising temperature towards the end of the week, Saturday being the hottest day since August 10, 1901, which was exactly the same—viz., 85.2deg.

## Fiscal Policy: The New Departure.

Before expressing our opinion on the new fiscal question raised by Mr. Chamberlain, we must disclaim any political bias, at least so far as party politics are concerned. There is such an enormous difference between the policy which governs a party and the policy wherewith the same party governs the country, that we may reasonably ask, What is the real meaning of the word "political?" What are politics? With regard to agriculture and its interests, we are afraid politics are a game in which those interests take the form of the shuttlecock, which is kept rising and falling at the will of the player, but is much more frequently down than aloft. Well, the fiscal suggestions are before the country as a political question, and with Mr. Editor's permission, we propose to shortly discuss their probable effects in relation with agriculture.

Opponents of Mr. Chamberlain's suggestion are raising a cry against taxes on food, and probably a number of farmers are secretly rejoicing at the prospect of obtaining more for their produce, and the price of Wheat is the point in which they take the greatest interest. The price of Wheat represents the price of bread, not quite exactly, but nearly enough for purposes of argument, and it is absolutely absurd to suppose that the electorate of this country will sanction any artificial enhancement of the price of the loaf. If Mr. Chamberlain's suggestions should be worked out in practice, though Wheat might be taxed, the impost could only be a small one, at any rate until our colonies should be in a position to supply the greater part of our deficiency of bread stuffs.

The farmer who hopes for the imposition of protective tariffs sufficient to revive British Wheat production, is living in a fool's paradise. The people who argue that we can produce Wheat sufficient for home necessities are only talking nonsense. It can be done; but not as a paying transaction. We could produce the Wheat if it would pay to do so, but the crop requires more field room than our England can supply, and it does not under modern conditions employ very much labour. As towns increase in size and number the purely agricultural area of the country must decrease, and any artificial stimulus to the production of cereal crops is really not to be desired, either from the standpoint of the general or of the agricultural interest. We are by no means sure that Mr. Chamberlain has in mind any serious imposts on imported cereals. The proposal is to investigate the whole question of imports with a view to rearrangement of import duties. It is reasonable to suppose that duties on tea and sugar, which fall entirely on the consumer, may be reduced, and imposts placed on imported manufactured articles which compete with home productions.

If we follow the common-sense plan of taxing articles in proportion as we can produce them at home or not, then Wheat would be one of those most lightly taxed, for we do not produce one-fourth of our requirements. And it is the same with Barley and Oats, though in lesser degree. How could the live stock of this country be fed if there were no imports of Barley, Oats, and similar feeding stuffs? We cannot produce a sufficient supply of brewing materials even, and it would be suicidal to impose duties which would be in the least degree prohibitive. Of course, the point of the whole proposal is the giving a preference to our colonies and if anything should come of it there can be no doubt that Canada would be one of the chief gainers, for

her climate is suitable for the growth of Barley and Oats as well as of Wheat, and no doubt if she had sufficient encouragement she could enormously increase her export of all three cereals.

Will Bradford agree to import duties on wool, the raw material of her industry? If wool be taxed there is no doubt that it will benefit the British farmer, and the price of wool is now so wretched that he deserves all the help he can get from this quarter. The preferential tariff would greatly encourage Australian sheep owners by giving them an advantage over their Argentine rivals. By encouraging sheep-breeding, however, it might also give a fillip to the frozen mutton trade, whilst the Argentine demand for pure bred rams might be expected to show a decline.

There is another corner of this subject that may readily become a very important one when every point has been well and fairly considered. Politicians of all creeds are agreed as to the extreme desirability of retaining our rural population, and none will dissent from us when we say that the land to be more productive needs more labour, more manure, and higher cultivation altogether. As our arable fields become restricted it is necessary that they should receive more forcing treatment. But how is it to be done? From whence are we to get the needed stimulus? From Mr. Chamberlain's new idea, if it should be carried into effect. It would be taxing food, and the towns might set their faces against it at first, but it would be taxing luxuries more than necessities. We are referring, of course, to the enormous imports of foreign vegetables and fruit which reach this country in advance of our season, and have very nearly ruined British market gardeners. Fruit and vegetables out of season are luxuries, and people who require them should afford to pay a duty on them. An advantage for the home grower in his own market would greatly encourage the production of all kinds of British vegetables and fruit, and in all probability the consumer would very soon reap a benefit in having as good a supply as ever, and of sounder food. The encouragement of more intense cultivation of this kind would indirectly stimulate the production of eggs and poultry, as well as dairying, for it is the occupiers of small holdings which do the lion's share in supplying the country with those articles, the demand for which is ever increasing. Without duties on vegetables and fruits we should be better as we are.

## Work on the Home Farm.

We have had a very dry week, with very high winds and an immense amount of dust. Rain is wanted badly everywhere except in the hayfields. Hay making has been the chief work all round us, and ricks may be seen in every direction; little grass is left standing, and in a few days the hay harvest will be over.

Turnips are stopped for want of rain; they grow slowly, and but few fields have yet been singled. Now that hay is practically out of the way all hands can be sent to the Turnips. It is most necessary now to get the hoeing done quickly, for the time before harvest is getting very short. Fortunately the use of string binders makes it possible to keep men amongst the root crops for some time after reaping has commenced.

Farmers who intend to spray their Potatoes must be having the work done. We had a most striking illustration of the value of spraying last year. One field only amongst many was sprayed, and that field kept green much longer and produced a heavier crop than any of the others. The cost of the operation seemed heavy, but it was a remarkable financial success.

Sheep pastures are drying up rapidly, and ewes are beginning to lose their milk. We are meditating early weaning of the lambs. There is plenty of dry food now, and the lambs will never be deprived of their mother's milk under more favourable conditions. There is plenty of grass fog ready for them; we can spare them a few Mangolds, and the Cabbages are ripening nicely, so there will be plenty of good sound food for the immediate future. We shall dip both ewes and lambs when we separate them. The dip we shall use is of the nature of phenyle, and is non-poisonous. The whole operation will cost little more than 1d. per head. Surely there is no excuse for neglect of dipping. This reminds us that we have not got compulsory dipping yet. We trust that such a time will come, and that it is not far distant.

The wisdom of insuring farm men against accidents is shown by two accidents which have just happened, both of them to foremen. In one case, uninsured, the man was trapped between a cart shaft and a wall; he will be disabled for two months at the farmer's expense. The other was knocked down and mauled by a young horse, seriously injured. His employer is receiving compensation from an insurance company.

THURSDAY, JULY 23, 1903.

**Poverty.**

**P**ROBABLY half of the ills our plants are heir to is directly traceable to poverty, and an additional percentage indirectly to the same cause. This, apart from the fruit bearers of which, in spite of the gospel of feeding so vigorously preached of late years, glaring examples in the way of impoverished orchards and garden starvelings are still common. From such time as a reaction set in against the use of those heavily rich composts our forefathers delighted to humour their pet plants with, and the introduction of highly concentrated chemical compounds in lieu of them, there has been, and is, judging from appearances not infrequently met with, a good deal of unhappiness in plant life, and that not wholly within the confines of the glass department. Probably past masters in plant culture were prone to carry the great muck doctrine to extremes, like one who

Spreads of manure a waggon-load around,  
To raise a puny Daisy from the ground.

But possibly we of latter days have gone to extremes, too, in the other direction, deceived by the appearance of loams obtained locally, the bulk of which, as removed from worn out pastures, is but a hungry medium. That the popular Chrysanthemum has not suffered from poverty goes without saying; gouty stems, fat foliage, and bilious blooms have too often shown a surfeit of the good things of plant life, but that rather emphasises the hungry look characterising many stove and greenhouse plants, even in some of the high places of the great gardening world. Too much margin has, perhaps, been left for the application of liquid stimulant or chemical fertilisers, which, unless judiciously and persistently applied, have rather a spasmodic action on growth and health sustenance than more lasting nutriment combined with the potting compost.

**R**EADERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "**THE EDITOR,**" at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

Plants which are potted annually and thus divested of most of their former crop of roots, such as Fancy Pelargoniums, Cyclamens, and Fuchsias; or plants which are shifted on under biennial treatment, such as Zonal Pelargoniums and others of that ilk, are so grateful for something more than a poor soil and the promise of good things to come, which they may or may not get, that they undoubtedly merit more consideration at potting time than they are apt to receive. For such things and for others, of which more anon, well dried cowdung is an incomparable addition to the potting compost. A few barrow-loads thoroughly well dried on the top of a boiler until as hard as biscuits, and packed away in a barrel or bin, is always ready and in prime condition for use at any time. Broken up into nubbly bits small or large, according to the size of pots to be used, and mixed with the compost, not forgetting a handful as a finish off to the moss or rough stuff over the crocks, there is a permanent enjoyment for the plants to which vigorous health will soon testify; with most flowering subjects, too, without sacrifice to wealth or beauty of bloom. Proofs of its value in practice are easily obtained, and if young plant growers will put it to the test at their usual time of potting certain things by treating a few plants, say of Fancy Pelargoniums, either as young plants potted on, or cut-backs staked out, to it, advantage over the usual method will be sufficiently obvious to ensure conviction.

Amongst stove plants the Caladium family are quickly responsive to this fertiliser, and given the rough compost they revel in, viz., fibry loam, peat, charcoal, and sphagnum, forming a rough, lumpy mixture, with dried cowdung liberally added, under the mild excitement of gentle bottom heat results will be, perchance, a revelation to many. It is in just such a mixture the handsome Acalypha (hispida Sanderiana) reveals its possibilities as a decorative plant, and noble specimens with a couple of dozen crimson tails depending from amidst broad, massive foliage are grand objects so seldom seen, perhaps, that one might well wax enthusiastic even over such a common subject. Cowper, who remarked,

If vain your toil,  
Then blame the culture, not the soil.

could not but admit that the latter is an important element, more especially with plants imprisoned in pots.

The use of bulky manures, however, in potting composts is not suitable for all subjects, and plants of harder texture requiring several shifts ere they reach the final stage as specimens, as which they might remain undisturbed for several years, would rather enjoy a top-dressing annually than its use in the soil direct, where from its nature a soured, soppy condition would eventually obtain. Otherwise there is great scope amongst the many objects of either stove or greenhouse culture which show the pangs of poverty, and plead for better treatment.

No disparagement of the valuable and handy stimulants, such as Clay's fertiliser, or Thomson's Vine and plant manure, is intended, both of which the writer has firm faith in. As with Liebig's extract and "the roast beef of Old England" in the economy of human life, so with the chemical compounds and heavier manures in the plant world, each have their own place on the respective menus, and will hold their own. Like ourselves, too, plants enjoy a change of diet, and the grosser feeders they are the more do they seem to appreciate the grosser and more bulky sources of nutriment. Such at least has been proved in the practice of—A. N. OLDHEAD.

## Origin of Vegetables.

The English climate, abused with right goodwill by all and sundry, and abominably as it certainly does too often behave, yet produces a wonderfully varied supply of the genus "vegetable." Nevertheless, we have to defer to and pamper many of its species, and use all sorts of arts and contrivances to bring them "up to the scratch," and train them in the way we wish them to go. This is only fair, seeing that most of them are strangers originally to our soil, and considering the extreme pitch of excellence to which they accommodately bring themselves. Autres terres, autres mœurs, and though we employ our green foods rather differently for the most part to our Gallic neighbours, who serve up at least one dish neat of the particular kinds in season at the

moment, both at déjeuner and dîner, utilising them but little with the other savoury courses; yet we in our way mixing them up and eating them as adjuncts to the meat dishes, enjoy them after our own lights, and with an equal if not keener relish. Still, the continental, less solid and more airy style of cookery lends itself, it must be confessed, more than ours to many insidious and wonderful plats of much delicacy and flavour. Disraeli's epicure and Horace's gastronomic savant would unquestionably cast their vote in favour of the undoubted art of our foreign friends. A subject, therefore, of so great variety, and capable of so many possibilities, calls surely for some research as to the origin and antecedents of its vegetable components.

Taking the Potato first as being so universal nowadays, that its absence would be felt almost as much as that of one's household bread, it is a matter of recorded history that it was discovered and brought over by the Spaniards, those pioneers of a bygone age of industry and adventure, from Quito in Ecuador, and introduced into their own country. Darwin in his official naturalist's voyage round the world in the Government boat "Beagle," made a particular study of all indigenous growths and animals. He describes how he found the Potato to be native both to the damp forests of the Chilian islands and the sterile mountains of the central mainland. As to Raleigh's finger in the pie, there is every reason to suppose the tuber he brought from Virginia was not the common but the Sweet Potato.

Putting the Tomato next as being of kin to the former, though one feels almost inclined sometimes to call it a fruit, especially by reason of its beautiful colour and its pleasant flavour in its fresh state, this, too, can be rightly claimed by South America for its birthplace, though long introduced to other congenial, moist, and temperate climates. It was brought into Europe early in the sixteenth century, and has been called the Love Apple, because it is romantically supposed to incite the tender passions!

Celery, on the other hand, is indigenous to our own country, certainly England and Ireland; in its natural unredeemed state being partial to ditches and marshy places near the sea coast. So, too, Seakale, as its name would lead one to suppose, is a spontaneous growth along the coast of England and Ireland, the Scotch lowlands, and the western coast of Europe.

Asparagus (or old style Sparrow Grass, as some of our rustic gardeners yet term it) may be said to grow wild alike on the south coast of England as on the desert steppes of Russia, where it springs up so abundant that it is eaten down by the cattle as grass. The sand dunes of low-lying Holland would make an excellent semi-natural ground for cultivating this delicacy in a large way. Proctor's "dull tame shore," for which he loved "the great sea more and more," might, indeed, be made in such districts, and under such advantages as these, if not to blossom as the Rose, at any rate, to produce much fertility in due season in other ways.

As to the Carrot, this root has become in the course of cultivation very much improved, and probably the "tame" product would scarcely recognise its original progenitor in the article, growing along the seaboard of southern Europe, and more recently in Asiatic Russia; while Salsafy grows in the meadows and pasture land of many districts along the Mediterranean, all along which shores may also be found the common Beetroot, so largely cultivated in places for the quantity of sugar it produces. This root is native besides to North Africa and districts in the west of Asia. The species known as white Beet is grown for the sake of its leaves, which are used as a substitute for Spinach.

More difficult is it to account for the Radish in its wild state, unless it proceeds from a plant of a similar nature, whose habitat is along the Mediterranean coasts generally. So, too, as regards the Onion. Its use and cultivation seem to have been well nigh from time immemorial. This much, however, seems certain as regards ourselves, that its birthplace and native country was not here, its original home being now lost in the mists of time.

Beans of various kinds were known in the days of the Egyptians, and later in the time of the Jews received a fair amount of cultivation, seeming to differ but little from those in use at the present time. They possess a special interest besides, seeing that they were employed for voting purposes both among the Greeks and Romans.

Finishing up with that invaluable member of the Cabbage tribe, the Cauliflower, of which Broccoli is another and newer species and cousin germain, there is little doubt it was introduced from Cyprus, where it has been in cultivation for ages, as also along the temperate shores of the Mediterranean, that natural sympathetic clime and auspicious soil for perhaps two-thirds of the whole race of edible garden vegetables.—J. A. CARNEGIE CHEALES.

### Melon, President Loubet.

Writing from The Gardens, Farnley Hall, Otley, on July 11, the undersigned says: "The new seedling Melon, President Loubet, was raised by Mr. F. Pheby, gardener to T. Duncan, Esq., Belmont, Otley, but was grown by me, as shown at the R.H.S. show. Will you please make a note of this?—JNO. SNELL.

#### *Cypripedium venustum Measuresianum.*

Amongst the very numerous *Cypripediums*, the well-known *venustum* is highly appreciated. Every collection comprises the type and several variations from, some of which occasionally find their way to the Drill Hall. Amongst the most distinct of these during recent years is the one we figure, and which was raised by Mr. H. J. Chapman when Orchid grower to Mr. Measures at Camberwell. We believe Messrs. Williams and Son, of Holloway, possessed the stock. The dorsal sepal is white, lined with green, the petals and pouch being yellow, barred with green.

#### *Cattleya gigas.*

Leaving expensive and rare hybrids out of the question, this is one of the grandest of *Cattleyas*, and one that, given proper attention, any amateur may grow without difficulty. As a rule, imported plants arrive in a good and leafy condition, needing only to be potted at once in clean potsherds after a thorough cleansing.

As soon as roots are seen starting the crocks may be covered with a very thin layer of moss and peat. In a warm house progress will be rapid, and the plants often flower the first season. It does not vary so much as some species, though there are several distinct from the type, and a poor *C. gigas* is very seldom seen.

A good form measures about 8 in across; the sepals and petals are rosy-purple with a deeper tinted lip, this latter having a white eye-like blotch on either side of the column. A native of New Guinea, this fine *Cattleya* was discovered by M. Warszewicz, a Polish collector, but though originally named after him, it is better known in collections by the above title.

#### The Week's Cultural Notes.

As yet Orchid growth in the majority of cases is in full swing, and the one thing needful is to keep them going as described in recent notes, carefully avoiding anything that is likely to check their progress, and helping them along by suitable temperatures and due attention to atmospheric moisture, ventilation, and cleanliness. This may be said to be the Orchid grower's simplest task, for with bright seasonable weather, long days, and genial evenings and nights, everything is in his favour.

But it is not a far cry now to the time of finishing growth, when watchfulness will be the order of the day, and each species—one might almost say each separate plant—requires attention to its individual wants. For instance, there is the long-bulbed, two-leaved section of *Cattleyas*, such as *C. Leopoldi* and its allies. These, when the season's growth is nearing completion and the flower spikes are forming, may with advantage be kept at the coolest and driest part of the house, as when growths start before the flowers are formed the latter are seldom as strong for it, while the plant itself is put out of season, as it were. This, with care, can usually be avoided in the case of these long bulbed species, though I admit it is far more difficult in the case of such species as *C. gigas* and *C. Dowiana*.

But the rough and ready methods that answer in the case of *Dendrobiums* must not be practised with these *Cattleyas*. Speaking of the former, we have now got *D. thyrsiflorum* and *D. densiflorum* both nearly at the apex of their growth. When they are quite finished, they may, after a week in a lighter, drier house than that in which they have been grown, be put out of doors in an ordinary sheltered position, or if a semi-sheltered frame is at command, it will suit them perfectly. Just at first they will need attention to watering at the roots very frequently, but after a couple of weeks in the open air only sufficient to prevent shrivelling will be required.

*D. aureum*, *D. Bensoniæ*, *D. Ainsworthi*, and *D. crassinode* are all species that finish early and lose their leaves in autumn, and from the time the latter turn colour, preparatory to falling, until the flower buds swell at the nodes, practically no water need be given, but cool, dry, airy conditions that conduce to a perfect rest and subsequent free flowering. These notes may appear to some a little premature, but it is safe to be on the look-out.—H. R. R.

### Insects as Garden Adornments.

The great Hymenopterous order, of which ants, bees, and saw flies are well known representatives, includes a host of insects common in gardens, and of varied form and habit, but all four-winged in their perfect state. They do not possess the beauty or lustre of many butterflies and beetles,

though some of them have brilliant wings or bodies, with showy colours. Conspicuous on the wing as flower-haunters, their life while in the grub or larval stage is mostly hidden from view. These insects, like those of some other groups, may be classed as species that are of service in gardens, those that are more or less injurious, and those occupying a neutral position. Many species furnish us with garden music, though it may be to the ears of some people a less agreeable melody than it is to the ears of others. Amongst the bees there is a joyous hum, and another expressive of anger or alarm.

It must be put down to the discredit of the insects under notice that a goodly number of them are possessed of stings, and are often not slow in using them. I have a little acquaintance with the pleasures and pains of gardeners, and so far as I have observed they do not frequently get stung by bees or other insects, yet of necessity they run more risks than the general public. They have to disturb bees in their visits to flowers; occasionally, too, they interfere with wild bees that are busy amongst foliage, or crawling upon the earth. A gardener, however, said to me that his fraternity are not over-sensitive about stings if they do get them, no

*Cypripedium venustum Measuresianum.*

more than they are to scratches and cuts; but he did object to the tickling caused by ants. These insects, which are Hymenopterous, abound in gardens we all know; nor do they simply crawl upon you, they bite also if irritated. I cannot say exactly how the garden ants attack us; but the large black ants of woods manage the business by making a couple of holes, and then injecting into these some formic acid.

Early in the spring, when the day is sunny, the humble or bumble bees (*Bombi*) put in an appearance—pioneers of their tribe, very conspicuous by size, colouring, and a sort of bustling activity. Certainly these spring individuals have plenty to do, for, like the queen wasps, having survived the winter, it is their work to start the new colonies of the season. Their colour varies much, even in the same species; but they are mostly banded with red, yellow, or black. Some people meddle rashly with them, forgetting, or not knowing, that the females and workers have stings, though the males are harmless. The fiercest is the stone species (*Bombus lapidarius*), very hairy, black, having bright red bands, named from its nest being often in heaps of stones, occasionally in dry, shady banks. But the moss humble bee is gentler, and is not enraged even if its nest is disturbed. This nursery is frequently some distance underground, and covered by a dome of moss; now and then one has been discovered situate in a crack of a garden wall.

Londoners do not regard the humble bees with friendliness. The dislike to them is probably to be explained by the fact that the insects bite holes in the corollas, or tubes, of some flowers, because they cannot otherwise reach the honey, owing to the shortness of the proboscis. Such

flowers are not seriously injured; but the bite disfigures them. Again, on the other side we note that the humble bee, if less important than the hive species, is designed by Nature to aid in the fertilisation of many flowers. Even out of this, though, may arise a grievance, since some say that by their indiscriminate scattering of pollen bees damage the strain of choice varieties. The sagacity of these insects may well excite our admiration when we watch their doings. For instance, we may see several humble bees standing in line; one of them is carding fragments of moss, which he passes to another, and the moss is sent on thus to the nest. Sometimes a gardener finds at early morn a humble bee sleeping in a flower, perhaps having been out late and lost his latchkey. Still more frequent is a species which is actually called the sleeper bee (*Chelostoma florissomne*), which reposes with its head pushed in as far as possible. It exhibits powerful and conspicuous jaws, hence the generic name. By means of these it bores holes in posts and palings, placing its eggs within tunnels.

How diverse the habits of bees are the names given to them show. We have masons, carpenters, upholsterers, and leaf-cutters; these are not social, but solitary. Many of them come into gardens to get materials, even if their work is elsewhere. Bees are sometimes responsible for pieces taken out of leaves which look like the nibbling of caterpillars on Roses, Lilacs, and Willows especially. Most of these "busy bees" are small, yet observable, as they have not the shyness of some insects. The bee that snips our Roses to make its leaf nest, stored with pollen and honey for its progeny, is *Megachile Willoughbiana*; it is black bodied but covered with brownish down, the males having fore legs dilated and fringed. An allied species is handsomer, showing yellow spots in head, legs, and body. It is *Anthidium manicatum*, prefers woolly leaves to line its burrow, which is a hole, found or made, in the ground if need be. Some of the *Osmias* bore into garden posts or other wooden objects—pretty little bees. A familiar one is *O. bicornis*; the female has curiously curved horns, the male bee lacks these; but both sexes are hairy, head and thorax brownish, the body black.

Many gardens, particularly in the South of England, are visited by the sand wasps, elegant and lively insects, which we may well regard with favour, because they are often serviceable to us. A good example is the common species called *Ammophila sabulosa*, a delicately formed insect, with long spiny legs. It is a diligent hunter of small caterpillars, which are carried one by one to the burrow on some dry bank. With each an egg is placed, the burrow being then closed by little pebbles. Another of these sand lovers is the hairy species, *A. viatica*, which Mr. Howitt has fully described from many observations in his Surrey garden. This insect stows away grey spiders for its young, and captures then successfully, being, he says, "all velocity and fire." With each spider one or more eggs are placed, and the hole is carefully filled up; more than that, the wasp finishes it off, so as to leave on the ground no sign of it.

A common insect akin to the preceding, black, banded and spotted with yellow, is *Mellinus arvensis*. It comes about our gardens in May, seeking flies, and though not rapid in movement, succeeds in taking them by artifice. Another May insect of this tribe is a good friend of ours, pretty and useful, having a large head, long legs, and slim body. This is *Mimesa bicolor*; seeks for prey the detestable cuckoo-spit, and contrives to drag this from its frothy envelopment.

Then to the same order belong the hosts of Ichneumon flies, various species of which abound from the spring till late in autumn. They deposit eggs upon other insects, and especially upon caterpillars, whose numbers are greatly reduced through their agency. Some have brightly coloured bodies; the wings often large and beautifully veined, are remarkably nimble, yet strong. Some of them are vocal, the yellow *Ophion*, for instance. Not unfrequently this insect enters our houses during the summer, flying upwards with force. It is an inch long, having a sickle-shaped abdomen.

The cuckoo bees are a remarkable family, parasitic in the nests of other bees, social or solitary. Some of them have been called wasp bees, their nearly bare bodies and wasp-like adornment of black, red, and yellow, suggested the name. These belong to the genus *Nomads*. There are also exceedingly pretty species of *Melecta*, more or less glossy black, but with stripes upon the body of creamy or yellow down.—ENTOMOLOGIST.

## NOTES

## NOTICES

### Good Potato Crop.

Some of the early crops of Potatoes have been got in, and the yield has been a good one, averaging five to six tons to the acre. Moisture is now wanted by the main crops.

### Edinburgh Women's School of Gardening.

Misses Morrison and Barker have removed their School of Gardening for Women from Inveresk to Corstorphine, their grounds adjoining the new nursery of John Downie at Belgrave Park.

### "Underground Irrigation."

This is part title of a pamphlet by John Grant. The full title of the little work is "Underground Irrigation in the British Isles and in India," and is to be had from the author, 8, Belmont Grove, Lee, Kent, on receipt of 1s. Drainage, rather than irrigation, is required in the British Islands.

### Appointments.

Mr. Wm. Jas. Penton, for six years head gardener and Orchid grower at Bowden Hill, Chippenham, has been appointed head gardener and instructor at Studley Castle, in connection with The Lady Warwick Hostel, now removing from Reading, and commences his duties on August the 6th inst. \* \* Mr. Mark Huntley, for the past four and a half years general foreman in the gardens at Normanswood, Farnham, has been appointed head gardener to The Lady Muriel Paget, Dower House, North Cray, Kent, and commences his duties on September the 28th inst. \* \* Mr. W. Page, late of Kew, as Orchid grower to G. F. Moore, Esq., Chardwar, Burton-on-the-Water, Gloucester.

### Notts Horticultural and Botanical Exhibition.

This society held its summer show in the grounds of the Nottingham Arboretum on Wednesday and Thursday, the 15th and 16th inst. The entries were in excess of last season, plants and cut blooms being well represented, but on account of the adverse season, outdoor fruits and vegetables (with the exception of Peas) were poorly represented. For a group of plants 200 super feet there were four exhibits, the first prize having again been secured by Mr. J. Thompson, gardener to the executors of the late G. R. Turner, Esq., of Derby, the leading feature being the highly coloured, single-stemmed Crotons, faultless in shape, and quite 8ft in height. Mr. Wagg, gardener to W. E. Denison, Esq., Ossington Hall, secured the second place, and Mr. W. Vause, of Leamington, the third, the competition between the second and third group being very close. In the smaller group of 120 super feet, for which five prizes were offered, there was only one entry.

In the different classes for stove and greenhouse plants, most of the prizes were secured by Mr. A. Vause, of Leamington. In the class for one specimen Fern the first award was secured by Mr. Orgill, of Nottingham, with a specimen *Nephrolepis exaltata* (*Aspidium*) quite 7ft in diameter. Collections of outdoor cut flowers were well represented, the first place being secured by Mrs. T. Rothera, Burton Joyce, with a clean, well-grown collection of most of the leading herbaceous plants, interspersed with Roses and annuals. Sweet Peas were a strong class, Mr. F. M. Bradley, of Peterboro', secured the first award. A gold medal was awarded to Mr. Goodacre for a splendid collection of Malmaison Carnations in pots.

The following awards were made for trade exhibits:—Gold medals: Messrs. C. J. Mee and Son, for a collection of foliage plants; Mr. J. H. White, Worcester, for an exhibit of herbaceous flowers. Silver medals: Mr. F. M. Bradley, Peterboro', for an exhibit of Carnations and Sweet Peas; Mr. W. L. Patterson, Shrewsbury, for a collection of Pansies and Violas; Mr. W. Waters, Birmingham, for a collection of Violas; Miss A. Stanley, Manchester, for a display of skeletonised leaves. Bronze medal: Mr. W. Bardill, Stapleford, for Nectarines in pots. The best trade exhibit in the show was a splendid collection of Roses staged by Messrs. J. Merryweather and Sons, Limited, Southwell, which must have been inadvertently overlooked by the judges when making their awards.

**A Conifer Conference.**

A conference to consider the genus *Coniferæ* in its many aspects, is to be held at Berlin, we believe, in August, and particulars are now being gathered regarding fine or old specimens in the British Islands.

**Death of Mr. William Pond.**

Mr. William Pond, for many years head gardener at Pinkneys Lodge, Pinkneys Green, Maidenhead, died suddenly on Saturday night. Dr. Plumbe had attended Mr. Pond, though not latterly, and it is supposed that death was due to heart disease. The coroner deemed an inquest unnecessary. Mr. Pond was very much respected among horticulturists, and was frequently a successful exhibitor at the annual shows of the Maidenhead Horticultural Society. He was 63 years of age.

**Gardeners in South Africa.**

Writing on June 21, from South Africa, a correspondent says: "I see and hear of gardeners coming into this country on the lookout for situations, but gardening in a private estate is very different from that in the Old Country, and situations are few and far between. Nor is this the only thing, for the owners are usually financiers or successful business men who expect far too much for their money, and nearly every place is undermanned. Far too often has the garden to pay itself by selling all surplus fruit, flowers, and vegetables. With these few hints, I should strongly advise gardeners to think before risking coming out to a country where men, who were carpenters and masons ten years ago, are holding some of the head positions in titled gentlemen's gardens at the present time."

**Emigrants' Information.**

The July circulars of the Emigrants' Information Office (31, Broadway, Westminster, S.W.), and the annual editions of the penny handbooks, show the present prospects of emigration. A new penny handbook, with map, has been issued on the Transvaal. The notice boards are now exhibited, and the circulars may be obtained free of charge, at more than 1,000 public libraries, Urban District Councils, and institutions throughout the country. In Canada there has been a very great demand for farm hands during the last three months, but this has now been fairly well satisfied. In New South Wales good rains have recently fallen, but over a large part of the pastoral districts of the State work has been very seriously hindered by the long drought, and the best opening has been in scrub cutting to keep the starving sheep alive; the total numbers of sheep decreased from forty-two millions at the end of 1901 to twenty-five and a half millions at the end of 1902, and these great losses in the pastoral industry affect the general demand for labour. In Sydney there is a considerable number of unemployed persons, for whom some relief works have been started, and emigrants are advised not to go to New South Wales at the present time on the chance of getting work. In Victoria the effects of the drought continue, and there is no demand for labour. In South Australia, in the country districts, there is good employment for agricultural labourers, for men able to work binders and strippers, for boundary riders, and for married couples without children for stations, but the local supply of labour is sufficient, and the long drought, though it has now broken, still affects the general demand for labour. Speaking generally, no working man is advised to go to South Australia unless he is specially skilled in his trade, or has friends to go to, or sufficient money to live on at first. In Queensland, in the north, there is no demand for anyone except female servants and some general labourers; in the central districts there is practically no demand for anyone; and in the south there is a good demand for agricultural labourers and general labourers only. Throughout Western Australia there is a good demand for agricultural labourers and female domestic servants. In New Zealand competent farm and general labourers and female servants have no difficulty in finding employment. In Cape Colony there is a demand for general labourers and farm labourers. There is no demand for miners or farm labourers in Natal. Permits are still required by those proceeding to the Transvaal; they are not issued in this country, but must be applied for at the Permit Office at the port in South Africa at which the emigrant lands. Application forms may be obtained at the Emigrants' Information Office, and elsewhere.

**Mr. Robert Sydenham.**

The well-known trader in bulbs and seeds is about to make a voyage to South Africa for the benefit of his health, and starts shortly for Durban.

**R.H.S. Committees at Cricket.**

The cricket match which was inaugurated last year between members of the Floral and Fruit and Vegetable Committees of the Royal Horticultural Society, has become an established event, as it would seem. The second annual match will be held in the park at Holland House, on August 8. Mr. W. Howe will captain the Floral men, and Mr. Geo. Woodward the Fruit folks. Members of the committees are invited to bring friends. Any communications in relation to the fixture should be addressed to Mr. T. Humphreys, R.H.S. Gardens, Chiswick.

**Birmingham Gardeners' Outing.**

The members and friends of this society journeyed on the 15th inst. to Trentham Hall Gardens, the seat of the Duke of Sutherland, at North Staffs. Good weather favoured the excursionists, who arrived about mid-day at the Trentham Hotel. Considerable astonishment was evoked by the fine and varied crops of fruit contained in the mileage of glass, and amongst the flowers the fine stock of the Malmaison Carnations were admired. A row upon the ninety acres of lake situated at the far end of the immense Italian flower garden was much enjoyed. Returning to the hotel a refreshing tea was partaken of. A small coterie of orchidists afterwards proceeded by tram to Walton Grange, the seat of William Thompson, Esq., to inspect the famous collection of Orchids under the charge of Mr. W. W. Stevens, the head gardener. At the conclusion Mr. Walter Jones proposed that hearty vote of thanks be accorded Mr. Blair, head gardener at Trentham, for his courteousness and desire to draw attention to numerous and interesting features of the gardens. This was seconded by Mr. John Pope, and supported by Mr. C. B. Bick.

**Shirley (Southampton) Gardeners' Annual Outing.**

The visit to Swanmore Park was made under the happiest of conditions by the members of the society on the 14th inst. The drive was through a fine stretch of agricultural country, and the park is located on one of the most beautiful sites in Hampshire, where horticulture is carried to a rare point of perfection. Assembling at headquarters a party of about forty were accommodated in a couple of brakes and had a very pleasant drive through Bostock, Swaything, West End, Purley, Honton Heath, Bishop's Waltham to Swanmore Park, and were here, in the absence of the proprietor (Mr. W. H. Myers, M.P.) welcomed by his steward (Mr. Edwin Molyneux) and the head gardener (Mr. G. Ellwood), and were conducted around the grounds.

A move was first made to the gardens, where the most noticeable feature was the excellent show of Roses, while there was also a fine assortment of other flowers, all of which were greatly admired by everyone. A move was then made to the glass houses and vineries, where Grapes of the Muscat of Alexandria and Madresfield Court varieties were hanging in huge bunches. After leaving the vineries an adjournment was made to the pavilion, where a good substantial meat tea was served. At the conclusion of the repast the chairman (Mr. B. Ladhams, F.R.H.S.) expressed their indebtedness to Mr. Myers for his kindness in permitting the visit. The vice-chairman (Mr. Geo. Greenslade) proposed a hearty vote of thanks to Mr. Molyneux and Mr. Ellwood for all they had shown them. Mr. Molyneux returned thanks on behalf of Mr. Myers, and said that if that gentleman had been able to have been there personally, he would have extended a hearty welcome to them himself. Mr. Ellwood also replied.

The secretary read a letter from the president of the society (Mr. W. F. G. Spranger, J.P.) in which he much regretted not being able to join the gathering, but had much pleasure in enclosing a cheque towards the expenses. After tea the company were shown over the model dairy, stables, cowsheds, piggeries, &c., all fitted with electric light. The view from the lawns is superb. Winchester on the right with Portsdown Hill on the left, the long line of hills of the Isle of Wight, and in the far distance can be seen Peterson's Tower, near Christchurch. All too soon the time came to return, but with a hearty send-off from Mr. Molyneux and Mr. Ellwood the party returned to Shirley, via Curdridge and Bottley, reaching home at 10 p.m. —J. M.

### Strawberries.

#### The Care of Runners and Making New Beds.

There is a natural human sentiment about the keeping of an old horse or an old dog after it has ceased to be useful, and allowing it to end its days in the peaceful retirement of kennel or stable, but this kind of feeling must not be extended to the Strawberry bed, no matter how good and prolific it may have been in its best days. The time over which a Strawberry plant will continue bearing depends very much on the conditions of culture and the treatment it receives, but at the most it is only a few years, and when it begins to show signs of impaired vitality, no sentiment or friendly feeling should prevent its being done away with in favour of a younger and more vigorous edition of its own self. I have heard of a Strawberry bed continuing in good bearing for as long as ten years, but this was under exceptional circumstances, and, as a rule, three or four seasons is the limit.

Perhaps when going over your Strawberry bed this summer to pick the fruit you have noticed a falling off. The fruit was not so plentiful, nor yet so fine as in the season before, and here and there a plant has succumbed under the strain of bearing. These are the signs of weakening constitutions and impaired vitality, and when they appear, depend upon it that the best thing is to do away with the bed after all the fruit has been picked, and make a fresh start. By careful management there need be no shortage while the young plantation is establishing itself, and where space permits it is a good arrangement to have three beds, so that when one is going off and doomed to destruction, you have another in full bearing, and a third just becoming established.

But before consigning a batch of old Strawberry plants to the outer darkness of the rubbish heap, they must be made to fulfil one more office, namely, the supplying of young plants for the future bed. There seems to be a natural desire on the part of an old Strawberry plant to establish its kind before passing from the scenes of its own triumphs, and, therefore, its last useful act is that of sending out numerous runners, which follow the instincts of nature by taking root and establishing themselves in the vicinity of the parent.

For the making of fresh beds many people content themselves with taking up these rooted runners in the autumn for transplanting, but in garden cultivation it is a slipslop method to say the best of it. Plants obtained in this way have no chance of becoming established before the winter sets in, and if they manage to survive the latter season, they only produce a few straggling flowers the next summer, and another year passes away before they bear anything like a crop.

If circumstances necessitate the formation of a new Strawberry bed, follow my advice and go to a little trouble over the selection and treatment of the runners, on the assurance that you will be rewarded in the end. First form an idea of the number of plants you will require, and then fill sufficient 3in. pots with a mixture of loamy soil and decayed manure in equal quantities, pressing the compost in firmly. Select sturdy runners at once, that are just emitting roots, and fasten them on to the surface of the soil in the pots by means of small wooden pegs. The soil should be kept moist by watering, when necessary, until the runners are rooted, after which the connection between them and the parent plant may be severed.

The next best method to the above is to cut sods of turf into pieces about 3in. square. These should be well soaked with water, and placed grass side downwards near the plants, the runners being pegged on to them, as recommended above. The turves must be kept in a moist state by watering until rooting has taken place. Failing either pots or turves, I would suggest reducing the runners on a number of old plants to say half a dozen. Then prick up the soil round the parents, and work in a little decayed manure or artificial fertiliser. By this means the young plants will root quicker, and be stronger than if left to establish themselves as best they can in the hard ground. In any and all of the above operations the object is to secure strong early plants, and these obtained, the sooner they are in their permanent quarters the better.

In the work of planting, however, the state of the weather should be taken into consideration. Though an advocate of early planting, I would rather wait a month than put the plants out when the weather is hot and the soil dry as dust, just for the sake of getting them in by a certain date. Strawberries planted in moist weather in August, or even September, have an infinitely

better chance than if they were put out in dry soil under a scorching July sun, and by waiting for suitable conditions the labour of watering is also minimised.

Deeply cultivated, rather retentive soil, is what Strawberries rejoice in, and by the time the plants are ready to go out there will be space available, as early vegetable crops will be removed. Ground that has carried a crop of Potatoes or Peas may be utilised for Strawberries, but before the latter are planted it should be deeply dug, and a dressing of well decayed manure be worked into the subsoil. Two feet apart, and the same distance between the rows, may be allowed in planting, and if the runners are nicely rooted in pots, all that is needed is to see that the soil is moist before they are turned out, and then plant with a trowel and press the soil firmly round the roots. When planting care should be taken so that the crown of the plant is level with the surface of the ground. If set in a hollow there is a danger of the crown decaying through wet, and if much above the surface it is likely to suffer equally through drought.

Hot and dry weather after planting necessitates watering till the Strawberries are well established, but this should be done either early in the morning or late in the afternoon. After cultivation consists of stirring the soil between the rows with the hoe, and if any of the plants are lifted by frost in the winter, they should be made firm and secure by the time growth commences in the spring.

Provided early runners are obtained, and the above routine is followed under favourable conditions, the grower will be rewarded by a nice little crop of fruit the first summer after planting.—G. H. H.

#### Notes for Exhibitors.

**MELONS.**—Splitting of the fruits is often a source of much trouble to some growers, while others manage to avoid it almost entirely. The evil is brought about by various and opposite conditions connected with culture. No one can, perhaps, claim complete immunity from the trouble, but undoubtedly by good management it can be reduced to a minimum.

Leaving a chink of air on the top ventilators and maintaining a little heat in the hot-water pipes at night, and during dull or wet days, are generally recognised as good methods to adopt during the ripening stage. In regard to the application of water at the roots, there is, however, much diversity of opinion, and consequently of practice. Some cultivators withhold water entirely after the fruits show signs of colour over the greater part of their surface.

With this treatment cracking is often prevented, especially in the case of varieties which ripen quickly. In other instances there is a shrinkage at the stem through sheer lack of moisture, but this "drying off" process is certainly not productive of the highest flavour and juiciness. Another practice is to let the soil get very dry and then give a little water—"just enough to keep the plant going," as it is often put. Well, my experience has taught me that this is the least effectual of all methods of preventing cracking, because under the influence of dryness at the root the sap vessels contract, and when water is applied the tender skin cannot resist the pressure and therefore splits.

I have proved over and over again that it is not really necessary to treat Melons on starvation lines when the fruit is ripening in order to prevent cracking. Given healthy plants with plenty of root action and a little growth going on at the extremity of shoots carrying a fruit, watering may be continued right up to the time of cutting. Then if the fruits are placed on a dry warm shelf for a few hours the best of flavour may be obtained.

In regard to watering, it must, of course, be performed judiciously, but the soil should get very little drier than during the growing season, while the fruits are swelling. Sometimes the weather appears likely to be dull throughout the day, and under such conditions the plants would need no water till the following morning; but if bright sunshine suddenly occurs those in charge should be on the alert to water, and, if necessary, to shade for an hour or two.

It is then an excellent plan to partially cut through the shoots just below fruits which are ripening. When exhibiting in single dish classes, where the decision is usually decided by flavour, moderate sized fruits, which are heavy in proportion to their size, usually win, provided they have been cut when in just the right condition in regard to ripeness.

It is, however, a very common mistake to cut such deep fleshed kinds as the Hero of Lockinge and Countess a little too soon. They require to be thoroughly ripe before they gain their full flavour. To provide beautifully netted samples 5lb or 6lb in weight for collections of fruit, two or three fruits only should be allowed to develop on a plant. They then grow quickly from start to finish, whereas heavy cropping causes the fruits to remain stationary for a long time, and sometimes to become hard in the skin.

**FIGS.**—Brown Turkey and Negro Largo are still the varieties generally exhibited early in the season. While taking their last swelling the selected fruits should be fully exposed to sunshine (by tying back the leaves), and the atmosphere of the house kept fairly dry by free ventilation.

To keep red spider in check syringe the foliage once a day whenever it can be done without wetting fruit which is approaching ripeness. Water the borders whenever the soil is fairly dry, and apply stimulants in the form of artificial or natural liquid manures. When fruits can be picked from the trees and staged the same day it is not a serious drawback for them to have burst their skins so as to show the fresh, luscious-looking flesh beneath, but for distant shows always select fruits with whole skins.

In warm districts those who have good trees of Brunswick in the open air will find them of great service for supplying grand fruits during August and September. The shoots should be trained very thinly, and the trees watered freely when necessary, and it is always wise to enclose the best specimens in muslin bags as they approach ripeness, as wasps will often ruin them in a day. In close competition a grand dish of this fine Fig in a collection of fruit will sometimes just enable the exhibitor to snatch victory from an opponent.

**APPLES.**—Gascoigne's Scarlet Seedling, Lady Sudeley, Beauty of Bath, and Worcester Pearmain are favourite dessert varieties for August and September. It is always an advantage to have a few trees growing in pots, as they can, of course, be ripened earlier, and the colour is generally brighter, too, than when grown in the open air. When grown under glass there is usually not much superfluous growth to prevent the fruits from getting full exposure. Those growing on bushes in the open air should, of course, be thinned early (this year I am afraid few have needed thinning) and special attention paid to stopping. The great point is to give every selected fruit full exposure, to ensure early ripening and even colouring, and to secure these essentials the shoots may, where necessary, be pinched somewhat earlier and closer than is desirable under ordinary conditions. Superphosphate, given at the rate of 3oz per square yard, and watered in, is also of great advantage in helping forward the colouring process.

**PEARS.** — Jargonelle, Clapps' Favourite, Williams' Bon Chrétien, and Souvenir du Congrès figure frequently on the exhibition table during August and September. In their case it is an even greater advantage to have trees in pots than with Apples. However, whether growing in the open air or under glass, the chief points to aim at are to expose the fruits fully to sunshine and feed liberally while they are swelling, sulphate of potash being the best of all manure for Pears.—H. D.

#### *Saxifraga aspera.*

Among the entangling mazes which obstruct the path of the cultivator of the Saxifrage in its varied forms, there are none so perplexing as that of nomenclature and classification. Yet there are certain distinctions, not easily described, but evident to an observer, which help one largely in selecting plants which are distinct in their way. Among the members of the genus which may be taken as typical of a small group is *S. aspera*, a representative of the section called *Trachyphyllum* by some authorities, the leading features of its plants being broadly described as being of dwarf, tufted habit, with fleshy or leathery small entire leaves. Some, such as *S. aspera* and its variety *bryoides*, are hard to the touch, and look like short, thick, grey-green pieces of cord. The species *aspera* may be said to approach the Mossy section, though botanically it is somewhat far apart from it. It forms a small, prostrate, tuft of grey-green lance-shaped ciliated leaves, and growing only about 3in high. As a flowering Rockfoil it is of little value, as its blooms, which are whitish, are sparsely produced, and I grew a plant for years without it giving me a single bloom. It forms little stolons, and differs in this, as well as in the colour of the flowers, from its reputed variety, *bryoides*. The latter forms rounded rosettes of leaves, and the blooms are yellow. It might almost have been retained as a species. *S. aspera* and *S. a. bryoides* are not very particular as to the soil in which they will grow, and a compost of loam and leaf mould, with a little sand and grit, I have found to answer well. Both are perfectly hardy.—S. ARNOTT.

## Illustrations from Southampton Show.

On four of our pages to-day, we give features from the recent horticultural exhibition held at Southampton, and which we fully reported on pages 59 and 60. The group of Gloxinias herewith shown was staged by Messrs. John Peed and Son, of the Roupell Park Nursery, West Norwood, London. The colour of this collection was magnificent, and certainly it was one of the features of the show. An inspection of the photo shows the light and shade of the blooms, which, to an experienced eye, will reveal the high class merits of the collection. The varieties were Mrs. W. Weaver, Howard Preed, Boule de Neige, Mrs. J. Preed, Countess of Warwick, Empress of India, and others. The group received a silver-gilt medal.

The exhibit of vegetables (from Sutton's seeds), shown on a back page, came from Lord Aldenham (gardener, Mr. E. Beckett), Aldenham House, Elstree, and received first prize. It contained Early Giant Cauliflowers, Duke of Albany Peas, White Leviathan Onions, New Red Intermediate Carrot, and Perfection Tomato. It will serve as a guide how to stage vegetables effectively. Every care is taken to have even samples, to set them out with taste, giving each subject sufficient space and freedom from its neighbour, and to have everything well finished off. What is the purpose of good culture, if judgment and care are lacking in the disposition of the produce?

Then there are four views of the Rose exhibits. The Roses were backward on the whole, but the blooms in the photographs are creditable. Mr. F. W. Flight (gardener, W. Neville), Cornstiles, Twyford, was leading prize winner in classes 2, 18, and 23 for the 18, 12, 9 distinct varieties respectively. The gentleman to whom we owe these photographs names the following as the best in these classes: Mrs. E. Mawley, Madame Cusin, Maman Cochet, Anna Olivier, Golden Gate, White Maman Cochet, Madame Hoste, Ernest Metz, Gustave Piganeau, A. K. Williams, Bessie Brown, Mrs. J. Laing, Marquise Litta, Caroline Testout, Ulrich Brunner, Marchioness of Londonderry, Comtesse de Nadaillac, Muriel Grahame, Medea, and Niphotos. He remarks: "One exhibitor, who is a well-known gardener, informed me that out of 500 plants, he could only gather enough blooms to enter in one or two classes, and even then without success. All along the south coast, the same as elsewhere, the winds and rain have played havoc with the Roses. The exhibits of Roses, taken as a whole, were very poor, the blooms being imperfect in shape and badly coloured."

The winner for the six blooms (class 20) was Mrs. E. Croft (gardener, G. H. Kent), Perwate Murray, Ryde, I.W., who had finely formed, well coloured flowers of Marquise de Castellane, Her Majesty, Le Havre, White Maman Cochet, Ulster, and Kaiserin Augusta Victoria.

#### Fruit Crop in Blairgowrie District.

During last week over forty tons of Strawberries and Raspberries were despatched by rail from Blairgowrie. Prices for Strawberries are still rising, the top being £25 to £26 per ton, free on rail. There has been a very keen demand for Raspberries, which are turning out a good average crop, and of about 2,000 tons grown in this district there are probably only about 100 tons still unsold. As there is no surplus fruit in England preserve manufacturers, fearing a scarcity of Scottish fruit, and their inability to secure sufficient to meet their requirements, were on Saturday buying at £40 per ton on rail, which is an exceptionally high figure. Raspberry picking will be in full swing next week. As a beginning in the way of doing away with "tramp" labour in the fruit fields, one large firm of growers have erected and fitted up excellent housing accommodation, and have arranged with the Scottish Council for Women's Trades, Glasgow, for about one hundred female pickers.

Southampton Show: Messrs. Peed's Gloxinias. (See page 75.)

## Gadding and Gathering.

### Reading College Garden.

The Portland Road Nurseries, till lately tenanted by Messrs. Sutton and Sons as their seed trial grounds, have been brought under the directorate of the Reading College Senate, who thus provide a good horticultural experimental area of seven acres for the fourteen students who are under training. The superintendent of this garden is Mr. W. H. Patterson, an old Kewite of note, and previously head gardener and instructor at Swanley Horticultural College. He, with his wife, work together, and have already, even after the lapse of only a few months, transformed the old grounds, and have furnished a trim and instructive garden. The advance so far made is, of course, merely a beginning, but it is eminently satisfactory so far as it goes, and was only attained by constant application carried till late in the evenings.

Part of the ground to eastward, at present a grass paddock, will be eventually cultivated and planted as an orchard. This section previously belonged to Mr. G. W. Palmer, the biscuit manufacturer of Reading, and what is called, "Mrs. Palmer's garden," separate from the paddock, is under stipulation to be maintained even as she designed and planted it. This is but a tiny feature of the college garden, and consists of a rounded, raised herbaceous plant and Rose bed, with sward, paths and shrubberies around it.

Turning to the already planted orchard, the young trees are seen to be taking hold, and the variety of fruits will afford material for some study thus early. There are twenty-six varieties of Apples, and proportionate quantities of the other fruits. Loganberries and bush fruits find a place. Pointing to a row of six Pear trees that had been planted in March last, Mr. Patterson stated that each had received different treatment, by way of experiment. The first had been left normal (unpruned); in No. 2 the fruit buds were taken clean away; No. 3 had been kept sprayed and watered well; No. 4 was treated to nitrogenous liquid; and the last was very severely pruned. Distinctly the best evidence was given by No. 2, which was pushing strong stout shoots, and was a large shapely tree. The hard pruned one had made very little growth, but would fill out in time; and No. 1, if I recollect right, was poor altogether.

In this connection the exhibit made by the Agricultural Education Department at the recent Royal show in Park Royal, comes to mind, and here one saw two young trees side by side. One had been branch-pruned at planting; the other had not. What was the difference? It was very marked. The unpruned tree had a splendid fibrous root system (so had the other), and long, strong, good shoots, bearing healthy foliage and one or two fruits. It was a good healthy tree. The pruned neighbour, alas! had scarcely done more than break its few buds. The question seems to be, which of the two would make the best tree eventually? And the reply on the top of this might be given that "it all depends." Placed into the hands of a sane person, I see no reason to doubt that the unpruned tree would not spank ahead, and continue to lead. Our friend "W. R. Raillem" has a Golden Spire Apple tree in his garden at Sproughton, and to use the knife on this is the exception. I asked him why, and he turned an irate eye upon me as he said, "I'm getting old; what do I want to cut away fruitful wood for? Talk about building up a tree, I want Apples." And to this end the branches were weighted downwards, thus tending to fertility, and an open, airy centre to the standard.

Reverting again to Reading College Garden, a collection of Sweet Peas is grown to demonstrate as far as possible Gregor Mendel's Law. Not far off is a patch of Rhubarb, the crowns having been forced this year, and then planted out in March. They have been liberally fed with fertilising liquid, and now the stalk and blades are fleshy, and stout, and quite dense. At the price Rhubarb has been bringing this year, this express system of culture would grandly pay. Then there were cultures of the various Brassicas, and Celery, Peas, Beans. A new seedling bed of Asparagus showed an even germination, not too thick; in fact, each plant just nicely apart from its neighbour, so that the question was asked, "Would you thin these this year?" to which the answer was, "By no means," for one can just as easily do that if it is necessary next year, the plants being still small, and as the bed will doubtless be lifted for the transplanting of some of the stock, there was nothing to gain and everything to lose by such premature thinning. These were my cicerone's own tenets, and he, moreover, mentioned the fact that growers can usually get 9s. per 1,000 for young, tender Asparagus.

The newly laid-out beds leading from the sheds through the paddock to a west fruit wall, are now filled with annuals, and all growing well. In this portion of the ground there are a few old orchard trees full of "snags," a grand object lesson (and that is what the garden exists for—teaching) on how *not* to prune. The American blight lay thick in by the crevices. "Can Poppies be transplanted?" Can *Cistus ladaniferus* and *Phyllostachys* and

other subjects of this sort be transplanted in May? Few care to try it, but here again, in proper hands, the operation can be safely and successfully performed, as can be seen at Reading College Garden. Bees, I may add, are another of the features of prime interest, and the latest forms of hives and apparatus are used. But now I leave my friendly guide and his charge, and trust that not a long time may pass ere I visit him, his wife, and their labours, again.

### Shrubs and Undershrubs at Kew.

The Honeysuckles are in full flower, including the quaint primrose yellow *Lonicera iberica*, but none beats our native *L. Periclymenum*. It is fitting to draw attention here to the golden-netted Japanese Honeysuckle, and its suitability for rockeries and rooteries. *L. japonica*, with buff and golden flowers, is very free, and most deliciously scented. Two rare species, but both too tender for out of doors, are *L. Hildebrandtiana* and *L. etrusca*, the latter from southern Europe and the former from China. They are each rampant climbers, bearing orange clusters, and *Hildebrandtiana* has flowers 8in long. *Philadelphus Billardi* carries from fifteen to over twenty pure white flowers in elongated trusses, the stamens in the centre of each giving them particular beauty. The flowers are each over 1in across. *P. coronarius* Gerbe de Neige is dwarf, free, and graceful; *Boule d'Argent* is double, and therefore distinctive; *P. c. variegatus* has cream and green foliage; *P. microphyllus* is an early flowering, very dense growing sort, with small flowers, and slender, twiggy shoots. *P. grandiflorus laxus* is good; *P. Lewisi* has snow-white flowers and white stamens: it is, therefore, a gem. *P. grandiflorus floribundus* is the best of all, with pure white blossoms nearly 3in across, beautifully borne in showery masses on all the young wood from the topmost to the lowermost branches. The leaves are dark green and large, this being a vigorous grower.

*Zenobia speciosa pulverulenta* is another of these, bearing from the axils of all the leaves triplets of grey-white, waxy bell flowers like those of Valley Lilies, but larger, and they all hang downward. The shrub flowers on last season's wood, but not on the young growths, these being quite glaucous with a "bloom" like that on well-finished Grapes. Growing as a true bush, 2½ft to 3ft high, and doing well with other Ericaceæ, this distinguished variety should be found in every collection. The type plant is a bright leaved, close growing, admirable shrub.

Then there is *Kalmia angustifolia*, or "Sheep Laurel," with bright purplish-red flowers now nearly over, and with it is the variety *rosea*, a sweet thing. These shrubs, of course, like a cool bottom, whence they flourish, and along with the better known *K. latifolia* they are charming little subjects. Nor can one pass over *Daboecia polifolia*, which seems happy anywhere, and generally can throw up a lively show of slender racemes, bearing from four to eight flowers of a rosy, white, or purple colour, according to the variety, and shaped like those of *Erica propendens*. Good plants form rounded, close-set masses, rising a foot high in the centre, and not unlike the Sun Roses in foliage and growth. The best known varieties are *bicolor*, *striata*, and *alba*. If they are stunted or starved the little shining leaves become quite blood-red.

Looking at the compact, spreading masses of *Bruckenthalia spiculifolia*, which never grows more than half-a-dozen inches high, the comparison of the form of growth with that of some of the coral polyps seems not amiss. It is of erect and formal growth, and the tips of the shoots are brightly luteous, while over the cushion-like bed the rosy spikes are sprinkled, these being comparable to the flowers of *Polygonum affinis*. Beds of *Erica cinerea*, *E. e. purpurea*, *rosea*, *alba*, and *alba major* and *minor* are masses of colour; while the deep pink clusters of the cross-leaved Heath (*E. Tetralix*) may be found on mountain, moor, and garden. *E. T. alba mollis*, a dense, erect, brittle, grey-coloured form with white flowers, is not so well known as the commoner *E. T. alba*, which seems to be the freer flowering.

*Rhododendron ferrugineum*, one of the loveliest of alpine shrubs and doing well in England, is now just out of flower and is pushing young growths, which can be encouraged by removing the ovarian clusters. The last flowers of *R. einnabarinum*, which is deep crimson without and bronzy-einnamon within the narrow tubular flowers, have also fallen, and the shrub, which is a Sikkim native, soon flags if left without abundance of root moisture. This profuse flowering and very distinctive species is one of my great favourites. Lastly, *R. hirsutum* will be found flowering in certain coolsome places. It is dwarf and spreading, a true Alpine rock shrub, and bears terminal clusters of bright, lilac-erimson, tiny flowers.

There is hardly any need to mention Roses, unless to point out once again the decorative and utilitarian merits of the Sweet Briar and other garden Roses for hedges. Not only are they beautiful in shape, with glossy foliage, but their lovely, simple flowers give pleasure at all times, and not a few are sweetly fragrant. By the way, is the double white Sweet Briar much known? The flowers are as large as a China and perfectly double, while the foliage is thick, robust, and large.—WANDERING WILLIE.

### Names of Plants.

Although I have a fair knowledge of Latin, which is often useful, I fail to see why plants should have names given to them which the men who have most to do with them can neither understand nor pronounce. Further than this, the words used have no existence in Latin, and these dog Latin words are mixed up with dog Greek and French. Not even content, the "inventors of language" seem to think that any English word or name can be made into Latin by adding "um" to the end. There is, as an example, a very fine Anthurium named after myself in sham Latin, "Fletcherianum." What can be the meaning of this, and how would a Frenchman pronounce it? Originally Latin was intended to be a universal system of nomenclature, which could be understood almost all over the world; but this idea has been done away with by the supposed conversion of English to Latin by the much enduring "um."—T. F.

### Rose Show Dates.

I do not quite follow "The Herefordshire Incumbent" in the difficulties he sees in the dates of affiliated Rose shows being arranged by the N.R.S. None of the cities he names—Birmingham, Leeds, and Manchester—have affiliated societies, and I can conceive no reason why Hereford should be asked to "take a back seat." Further, I spoke only of clashing with shows in the same district, or with N.R.S. shows. It would obviously not matter so much if Hereford clashed with an East Anglian show.

Hereford may be, for all I know, "the oldest Rose show in existence," but is it older than Norwich, which celebrated its fiftieth anniversary in 1879 by an extra grand show, when Mr. R. N. G. Baker came all the way from Exeter in the pouring rain of that terrible summer, with magnificent H.P.'s which carried all before them?—W. R. RAILLEM.

### "Gold Medallist in Horticulture."

On page 531 of the last volume of the Journal I asked several questions under the above title, which appears as an announcement (on advertisement boards at Snow Hill Station, Birmingham, and several other stations on the Great Western Railway) of special qualifications in horticulture. I am disappointed in not receiving answers to my inquiries as to the qualifications of the advertiser. I hoped that the advertiser might have some friends about Birmingham who would have substantiated for him the claim that he makes inferentially; or that the advertiser himself—which would be more manly and straightforward—would take the public of Birmingham into his confidence, and tell them in what way he is a "gold medallist in horticulture."

I have searched the records of the Royal Horticultural Society and of the Royal Botanic Society, and the South Kensington reports of examinations in botanical science; and I have made inquiries in other likely directions where there is a possibility of a gold medal having been awarded for horticulture or botany, and I cannot discover the name of the advertiser in any reports or lists of candidates for honours in horticulture or botany in connection with any society.

It has been suggested to me that the term "gold medallist in horticulture," as it appears on the advertisement boards, is a "flowery" way of stating that the advertiser has been awarded a gold medal of a certain size and value by a grateful and very liberal horticultural show committee for a non-competitive exhibit of a few of our very easily grown and common hardy herbaceous flowers. If this is the fact, are not the terms at the head of this letter, and on the advertisement boards, misleading? Would not it be more correct and truthful to use the words "recipient of small gold medal for hardy flowers"? Then the most ignorant would rightly understand, and not be so liable to make a mistake as to the qualifications of the advertiser.

Gold and silver medals are as plentiful among non-competitive exhibitors as Blackberries in autumn; but we have never before observed a recipient of either a gold medal or a silver medal under such circumstances advertise himself as a "gold medallist in horticulture." Trained horticulturists like my friends Miss Harrison, one of Mr. George Cadbury's lady gardeners, and winner of the Royal Horticultural Society's medal in horticulture; and Mr. Lewis Castle, manager of the Duke of Bedford's experimental fruit farm, winner of the Worshipful Company of Fruiterers' prize of gold medal and twenty-five guineas last year in open competition to all England, or Great Britain, are the bonâ fide "gold medallists in horticulture."—INQUIRER.

### Queries.

I have leave to cover in part of my kitchen garden with wire netting against birds. The walls are 10ft high. Can any gardener advise what sort of iron posts should be used? How fixed into the ground? What width of netting, gauge, and quality? What sort of iron horizontal supports? How strained over the walls? How to support brick walls?—C. N.

### Back to the Land.

Dare I say a few words upon the divergent opinions so freely offered upon "Back to the Land"? The subject has been well thrashed by many correspondents, and there appears a strong determination to agree to differ. The life of the small holder is not an ideal one; from its very nature it must for the greater part be hard and rough, with, in but few instances, remote possibilities of much pecuniary gain. Surely, however, such an existence is infinitely preferable to that spent by so many of the inhabitants of the slum portions of our great towns and cities. That success or failure depends largely upon local conditions and individual effort and enterprise needs little expatiation.—PROVINCIAL.

The first and most important principle in the politics of a nation is the care of its population. This is of necessity a nation's greatest wealth. The means whereby a steady increase is assured must always engage the attention of the statesman, and whatever they may consist of, it is absolutely necessary that they must contribute to the general good and happiness of the people. I think statesmen and political economists are agreed upon this point. How this is to be effected, or, if already in partial effect, how maintained, is ever the anxious question. Perhaps no one is able to very materially alter the general trend which works as silently in the upward and onward direction as the law of natural selection, but we can watch over its progress and foster here a promising tendency and curb there an undesirable incubus.

The policy of British legislation has been for many years one of vigilance and watchfulness rather than one incurring danger by unwise interference. The consequence is an increased prosperity in wealth and population. Such a state of matters must always, if it does anything, presuppose happiness, contentment, and plenty. Now, on glancing fieldwards, though we may not be learned in the secrets of the art of producing the all-essential foodstuffs for a people, we find, instead of Wheat, grass lands on every hand. Wealth consists of land and power, and it very naturally strikes us as strange that this part of wealth is so indifferently utilised in Britain. We ask, why, then, is Britain possessed of so many luxuries, her people the best paid, fed, and clad of all nations, and yet they till little of their land? We reason further, and say that Britain's wealth, happiness, and prosperity, all of which have no compeers, cannot be due to her productions in the form of food. We soon satisfy our curiosity in that matter, and eventually find that she purchases her necessities and needfuls, as well as her luxuries, in the foreign market. Even cut flowers have engaged her attention last year to the extent of £238,463, a fact of itself indicative of the wealth of the nation. She goes to a foreign market because she finds it necessary to do so, for it is the life of a successful trade to buy your wants in the cheapest market, and the more we do so, it follows that we sell more of those things we need less ourselves. It is the old question of barter over again. Britons want food, which cannot be cheaply enough produced at home, and in return they give coals, iron, &c., for that which they need. We are ready to patronise home foodstuffs, if they can be put on the market alongside with those of our foreign producers.

Think for a moment, seeing how completely we get along without cultivating our home land, how the matter would stand with us if our ports were closed to Free Trade. We would then be at the mercy of a class that never has much to boast of unscrupulous probity in dealing. Besides, any multiplication of effort in the direction of food producing could but insufficiently supply the demand, allowing that all available land for the purpose could be made to turn out many times more than it does now. Is it a matter for congratulation, therefore, to anticipate men investing their life savings in a few acres of practically unproductive property? Let any one who thinks so try, and I have no doubt he shall change his idea of the matter. Even on the Continent, where the conditions are immensely more propitious, how do things stand? This is what "Fairchild," in his admirable little treatise, "Rural Wealth and Welfare," says on that point: "One-third of France is cultivated by owners of farms averaging 7½ acres. Four-fifths of Bavaria, Belgium, and Switzerland are in farms of less than twelve acres. Even Prussia has 900,000 farms of less than four acres. These farms vary in quality from poorest to richest, and peasant farmers are not able to boast of their wealth." This is precisely what I would expect. Such farms cannot support a family, and the abortive energy expended in the pittance which is produced exceeds by far its value, and labour is always scarce in such communities, therefore it must be difficult to replenish the exchequer.—D. C.

## The "Daffodil King" on Tour.—No. 7.

(Continued from page 50.)

The vegetation and animal life of Australia are highly peculiar—so different from those of the rest of the world, as to show that this great island cannot have had any land connection with the continent within a recent geological period. The characteristic trees are mainly different kinds of *Eucalyptus*, some of which grow to a greater height than even the tallest giants of Sierra Nevada, California (Chisholm). We may note also *Acacias*, *Epacris*, *Tree Ferns*, and the type of vegetation known in our gardens collectively as New Holland plants. Mr. Scott Elliott in his "Nature Studies," gives a list of the heights of the various tallest trees, the first on the list being *Eucalyptus anygdaloides*, reaching to 459-498 feet. *Eucalypti* are being introduced to parts of California, and largely into South Africa. They make forests in a short time. Witness the woodlands on the outskirts of Johannesburg, barely over twelve years old, and in the distance resemble ancient forests.

### AUSTRALIA

After having noted Mr. Barr's travels in North America, Japan, Hong Kong, and the Philippine Islands, we are now introduced to the great Island Continent of the southern hemisphere, and Port Darwin, Queensland, is our starting place.

Port Darwin has a "botanical garden," but a garden only in name, however, for there are few representative plants. Coconut Palms do well, and it was here that Mr. Barr saw the largest Banyan tree of his tour. He was very considerably interested in the collection of small birds made by a Frenchman for the European markets. He had thousands of them caged preparatory to his annual visit to Hamburg and London.

The next stopping place was Thursday Island, the centre of the pearl fishery, and the town here is more Japanese than British, and remarkably hot. No other ports of call were recorded till Brisbane was reached, for the same steamboat company had coasting boats which took off both passengers and cargo, while the ocean ship lay well out from land.

According to Mr. Barr's estimate, Brisbane is the second loveliest town in Australia. It has its so-called botanic garden, but the Government affords very little support, and one can only speak of it as a public park. One part is devoted to flowers; there are a few remarkable trees, and lastly, a refreshment place. Queensland maintains two "man o' war" ships for the protection of its rivers. During a great flood one of these was landed high and dry in the botanic garden! Shortly after, another flood came and carried it back again.

In the neighbourhood of Brisbane, Pineapples are grown, and they are of very excellent quality. They are shipped to Sydney and Melbourne. There is also an experimental farm some distance down the line, under very able management, and designed to take a great many students. Numerous alterations and improvements were contemplated. One of the most profitable cultures consisted in a fine breed of pigs, which sold very readily for breeding purposes.

Maitland, a pushing little town, was the next resting place; and it is in this neighbourhood that Lucerne is so largely grown and made into hay. Much of this found its way into South Africa during the war.

Then comes Newcastle, famous for its coal, and Sydney, a city of narrow streets, yet possessing some very fine buildings. Inquiring the reason for the very narrow streets, Mr. Barr was told they were old bullock tracks along which shanties were located, and were succeeded by better houses, and thus the streets. Like London, the city "grew," with no general plan, though it is today very well built, and from a business aspect it is "a little London." Its botanical garden may be said to have been commenced "when Sydney was Australia," for only a few miles out lies Botany Bay, leading to the harbour, one of the finest in the world. It is exceedingly strange on the part of Captain Cook, who landed at Botany Bay, to have missed the opening to this grand sheet of water, in which the largest ocean steamers are berthed close up to the land. Gardening in and around Sydney will always be limited owing to the geological structure, which is almost all solid rock, with only a modicum of yellow loam. The botanic garden, however, has a world-wide fame, and was long presided over by Mr. Charles More, who is now retired, and succeeded by Mr. Martin, a most painstaking botanist. The plants under glass are in excellent condition, while out of doors the Palm collection calls for a special note. The botanical garden proper is confined within the old walls, and the area is not large; but probably by this time the wall has been removed and the large decorative area (which is reclaimed land) brought into the botanical policies. The parks and street corners of Sydney are, unfortunately, largely the resort of idle fellows and schemers; well dressed they are, but no one knows how they get their living. They are known to the police, however, as "gentlemen of no occupation."

### THE BLUE MOUNTAINS, AND JENOLON CAVES.

The Blue Mountains are the part of the Dividing Range behind Sydney. It may fitly be observed that the Dividing Range forms

throughout New South Wales a more continuous barrier than it does between the coast lowlands and the interior plains and tablelands in the colony of Victoria, and it was long before the settler found a way across the Blue Mountains. No one should fail to go up the Blue Mountains. There are some most wonderful depressions in the land, such as Mr. Barr had not met with anywhere else in his travels. To all appearance these, at some remote period, may have been great inland seas, such as are now to be seen in the United States of America. At present the basins are covered with virgin forests, and the home of parrots and other wild fauna. Here Mr. Robert Pitt, cattle salesman, Sydney, has a fine house and large garden, in which are grown some fine sorts of Cherries of very superior quality, and many other kinds of fruits; also many acres of Daffodils. Mr. Pitt, during the "great boom" in Australia conceived the idea of growing bulbs of all kinds, and spent many thousands of pounds in the purchase of Hyacinths, Tulips, Daffodils, &c., with the view, as he told Barr, of supplying gratuitously cut flowers to the Sydney hospitals &c. The bubble burst, and the man who was rich in paper to-day found himself poor in coin on the morrow, and so charity was realised as a thing which begins at home.

All the bulbous plants perished except the Daffodils, and these alone represent the fortune expended in the interest of "good work," and are now a source of income in the sale of the cut flowers and dry bulbs. Continuing the journey by rail up the Blue Mountains, a necessary rest is made for the night, when the coach starts in the morning to the Jenolon caves. These are maintained by the New South Wales Government, and lighted by electricity. The caves are many, and new ones are continually being found. The guides are also conservators, and receive a premium for every new cave found. Two parties are taken through different caves daily, and to see all several days are occupied. One cave is visited after breakfast, and one after luncheon. Stalactites and stalactimites are numerous and varied, and in one of the caves there is a charming miniature cavern, called the Fairy Grotto, in the main wall of the cavern. The guide throws a limelight on it first; it looks beautiful, but hard, then he turns on the electric light, all is perfectly transparent, and so lovely, one seeing it is not likely soon to forget the charming sight, each stalactite and stalactimite being in miniature and all perfect, it having escaped the eyes of the early visitors to this cave before the Government had taken these natural wonders under their control.

Paths are cut all through the caves, and no one is permitted to touch or to pocket any article within enclosure. These caverns had been the homes of millions of bats, as evidenced by the great accumulations of their droppings. None were now to be seen. The hotel is an excellent one, and run by the Government; no intoxicating drinks are allowed to be sold. The air is most delightful and refreshing. After spending hours underground a run on the hill drives away all feelings of fatigue, and sharpens the appetite for dinner. The feeling was one of delight to those who had come up to put in a few days or weeks and thus escape the greater heat of Sydney. "I do not remember," said the aged traveller, "any such recuperating atmosphere as that I enjoyed after the fatigues experienced in exploring these wonderful calcareous productions."

Referring again to the Caves, Mr. Barr said he visited a similar cave in Mondonedo in Spain, and believed that it might compete with, if not excel, those of New South Wales, and in saying this did not detract from those of New South Wales, only to show Europe has wonders, but undeveloped, but it could only be seen by torch light, and was not safe to enter unless a guide rope was used. The trip to the N.S.W. caves is inexpensive, and is arranged by two different tourist associations. A railway passes over the Blue Mountains, and the journey is finished on coach.

## Violas and Pansies from Rothesay.

Mr. William Cuthbertson, the senior partner in the well-known Scottish firm of Dobbie and Co., has sent the writer a lovely gathering of these charming flowers, that have been brought to such a high state of perfection by the firm.

Amongst whites, the two best rayless varieties are Emma Sophia and Mrs. Macrae; whilst in rayed flowers, Duchess of York and Bcthea are the two best, of excellent habit, which makes them suitable for bedding as well as for exhibition.

General Baden-Powell is an exceedingly rich yellow for exhibition. The best rich deep yellows are Bullion, Klondyke, and Kingcup. Primrose Dame, Lady Margaret, and Mary Robertson are primrose-coloured flowers, the first-named being an A1 bedder.

Blue Duchess is the best light blue variety for massing. Lady Roberts is a charming flower, white, edged pale blue. Florizel is pale lavender in the mass; it is one of the late Dr. Stewart's fine introductions.

Endymion is a beautiful lemon-yellow self, indispensable for exhibition. Another flower of high exhibition standard is Meteor (Paton), grand, large, rich yellow of perfect habit. Paragon, not yet sent out, is a rich, deep purplish-violet flower, with golden eye. A large and

Flaked and Self Carrations. (See page 81.)

telling flower is Mrs. T. W. R. Johnstone (Kay), upper petals mauve, under petals glossy black blotched with mauve, clean eye and white brows.

How sweetly scented these flowers are! One writer thus poetically puts it: "Violas resemble a spray of Western Pine in having a beauty and fragrance all their own."

A brief cultural note may be helpful to the many admirers of these charming flowers. The best way to obtain carpets or masses of Violas is to insert cuttings in a cold frame in August or beginning of September; such cuttings will make nice plants before the winter sets in. In February or March the plants should be placed in well prepared beds, 4in apart each way. Some beautiful varieties of Fancy Pansies of the firm's new Victoria strain, a fine acquisition, are well worthy of mention; flowers of brilliant hues, richly marked.—J. B.

## The New Curator at Birmingham.

The committee of the Birmingham Botanical Gardens have appointed Mr. Thomas Humphreys, assistant superintendent of the Royal Horticultural Gardens, Chiswick, as their curator, in succession to Mr. W. B. Latham, who retires at the close of the present summer. Mr. Humphreys, who is thirty-five years of age, served his apprenticeship with Messrs. Dickson, of Chester, and in 1887 was appointed Arboretum propagator and under-foreman at the Royal Gardens, Kew. In this capacity, the propagation of all the hardy trees, shrubs, and Roses was under his care. He was also engaged in remodelling the old shrubberies and in the removal of large trees. Whilst at Kew he was awarded high certificates for geographical botany, organography, and systematic botany, and chemistry and physics. At the close of 1892 he went to take up the office he now holds at Chiswick. Mr. Humphreys goes to Edgbaston in October, and will be ready to advise and to carry out an important scheme of rearrangement of the shrubberies and borders of the Gardens, a work which will occupy a great deal of attention for two or three years.

## The Horticultural Club.

### Excursion to Windsor.

The annual excursion of members of this club and their friends took place on Thursday, the 16th instant, and despite the somewhat unfavourable state of the weather, was greatly enjoyed. The party, about eighty in number, met at Paddington terminus, at 10 a.m., and proceeded in two saloon carriages to Windsor, where, thanks to the invaluable aid and management of Mr. Harry Veitch, who kindly undertook the arrangements, and the great courtesy of Mr. Nutt, the architect, Mr. Mackellar, the gardener, and Mr. Tait, the farm steward, the castle, the grounds, and the splendid collection of cattle were all inspected in turn under the best of auspices.

The club, thanks to special permission accorded by His Majesty the King, enjoyed the unusual privilege of visiting the private gardens as well as those more generally open to inspection, and it need hardly be said were delighted, not only by their beautiful design and arrangement, but also by the perfection of the order in which they were kept. So great, indeed, was the pleasure, that the fortunately transient showers and generally dull and threatening weather formed practically no bar to enjoyment. On arriving at Windsor some of the party elected to drive through and around the splendid park; the major number, however, deterred by the threatened downpour, elected to visit the interior of the castle, and although the state apartments were not available for inspection, a tour through St. George's Chapel, the Memorial Chapel, and other adjuncts of the castle itself was greatly enhanced by the presence of Mr. Nutt, who very kindly acted as cicerone to the party, pointing out with the finger of an expert the special points of architectural and historical interest.

To those who drove round the park the beauty of the scene was heightened rather than otherwise by the freshness imparted by the showers, the atmospheric effects in the long vistas of the avenues being charming. At one o'clock the party lunched at Messrs. Layton's, and subsequently were conducted over the gardens by Mr. Mackellar, passing through the private ones aforesaid, and thence to the dairy, viewing a fine collection of cows, and finally reaching Frogmore. A capital tea had been arranged by special permission in one of the Royal conservatories, after which a couple of hours were spent in the kitchen and other gardens, and eventually, under Mr. Tait's kind supervision, the prize cattle were paraded for the visitors' benefit, the party then being driven back to Windsor to dinner at Messrs. Layton's, which was in every respect satisfactory.

Mr. Harry Veitch presided, and after the toast of "The King" had been duly and gratefully honoured, the healths of Messrs. Nutt, Mackellar, and Tait, the two latter gentlemen being present, were proposed and drunk with enthusiastic recognition of their kind contributions to the enjoyment of the day, the function closing after a few words from Mr. Hunt, a visitor from

the Antipodes, with a similarly well deserved recognition of Mr. Harry Veitch's highly successful efforts to make it a red-letter day in the annals of the club. The party then broke up, returning to London as they came, and unanimously declaring that, had the clerk of the weather worn the sunniest of smiles, they could not possibly have enjoyed themselves more.

## Vegetable Notes: Carrot Failures.

Whether it is a common cause of complaint or not can be known only by correspondence, or by those whose business and privileges take them into widely separated areas, but in this locality, at any rate, Carrots are an extremely partial crop. Sowing after sowing has been made without any, or but poor, return, and at the present time there is a difficulty in meeting the daily demands of the kitchen. The fault does not lay with the seed, for this, in some instances, came up well; indeed, in my case, the main crop sowing for a time was most hopeful.

The site was fresh to Carrots, the winter crop being cleared, the ground was dug, broken finely, the seed at once sown, and the surface well rolled. All went well for a time, when a change from a dry to a wet period, the Carrots daily made backward instead of forward strides, until at length an isolated plant here

Mr. Thomas Humphreys.

and there only remained. The same thing happened with the earlier Carrot beds, except those in frames, and the first outdoor-sown. Soot, lime, nor salt afforded any remedy, the frequently recurring and heavy rains of June putting these out of use with the usual early despatch.

In my case I attributed the losses to the tormenting slug, which have been so prevalent this year. Large earthworms probably did much in reducing the crop, and adding to the troubles already too much in evidence. I have only seen one good main crop Carrot bed, and this occurred on heavy land. The failure of the earlier sowings enforced the necessity of continued effort. Ground cleared of early Potatoes has been sown with Early Horn varieties, and so far these appear safe and progressive. Since these seeds were sown the weather has been dry, affording conditions unfavourable to slug life on the ground surface.

Watering of the seed drills has been a daily routine with the object of affording a means of rapid progress, but it will not be possible to keep up a supply, only on a limited scale. Some gardeners are inclined to the belief that neither slugs nor worms are the source of trouble, but the Carrot louse or fly. This theory is of doubtful truth.

It would be interesting to learn from readers of the Journal whether similar experiences have been met in other districts and counties, or whether the complaint is simply a local one. Mr. A. Dean, whose experimental work carries him over a large extent of garden, may be able to afford proof of the prevalence or otherwise of this Carrot scarcity and scourge. Except for winter use, I prefer small sowing at intervals, rather than large ones made at one, or at the most, two, periods of the year. Large Carrots for ordinary home supplies are not so desirable as small tender roots, hence frequent sowings, which often make an easier subject of routine, are adopted, and usually with more all round satisfaction.—W. S.

#### Concerning Roses.

Roses, which form one of the greatest of the floral attractions of this season of the year, have a singular connection in old folklore with death. Camden, in his "Britannia," published in 1603, writes:—"There is a classical custom observed time out of mind at Oakley, in Surrey, of planting Rose trees on the graves, especially of the young men and maidens, so that the churchyard is full of them." It is the more remarkable since it was anciently used in this connection both among the Greeks and Romans, who were so very religious in it that we find it often annexed as a codicil to their wills. The Romans, of course, were famous for their love of Roses, and used them in huge quantities for decoration purposes at their banquets, and this love for the flower pursued them to their tomb. Among modern nations, the Turks display remarkable affection for Roses, which sprang, according to their legend, from the perspiration beads which dropped from Mahomet's forehead. They also employ them largely in decorating graves.

#### Irish Anemones.

Undoubtedly the finest strain amongst the Coronaria section are the St. Brigid Anemones. There is really nothing to equal them for size of bloom, brilliant delicate colourings, and lasting qualities. While writing this I am admiring a bed of them that is still continuing to open out quantities of blossom, and for beauty of colouring I have seen nothing to equal them this summer yet. In this district (North Shropshire) they are not much grown, and this one is the admiration of the immediate neighbourhood. The St. Brigid is a variety that can easily be grown from seed, which should be procured at once and sown immediately to produce flowers next spring. The seed being very light, of a fluffy nature, should be well mixed with sand to separate them and facilitate an even distribution when sown. They are a very hardy variety, increasing quickly, bearing mostly flowers of a semi-double form, and make an ideal spring garden flower. For cutting for decorative purposes they are also extremely useful, lasting a long time in water, and with their great variety of colours being adaptable to almost any required shade.—J. W. J., Oswestry.

#### The Effect of Light in Animal and Plant Life.

I note the very interesting and very able article in your last issue, by Dr. James Weir, in which he describes the effect of light in plant and animal life with but one probable error, which I shall endeavour to point out. He says, among other things: "Flammarion's beautiful experiments at the Climatological Station at Invisy have shown beyond question of doubt the widely different effect of the red and violet rays on plants. The plants chosen were of the genus Mimosa, or Sensitive Plant, and were subject to the same thing, with this exception: that some were reared beneath dark-blue glass, and others beneath the red. In four months the plants reared under the red glass had attained extraordinary development, while those subjected to the violet rays had made no progress whatever. Similar effects were noted in the case of Strawberries and numerous other plants, trees, and shrubs. The plants from beneath blue glass did not die, but seemed to remain in a dormant condition, without growth or further development. Zacharamietz, of Vacluse, has also shown that plants are strongly affected along the lines of rapid growth and development by red and orange rays. As early as 1883 I demonstrated and published the fact that typhoid fever germs would not live when subjected to the blue and violet rays." From the foregoing we get the impression that plants under a red glass are subjected to red rays of light, while the reverse must be true, as the red glass has absorbed all the red rays of light, and the remaining only have penetrated. Who has not observed that in a dark photographic room, where a red light is used, anything therein which is red will appear white? for there are no red rays in the room, all being absorbed by the red paper through which the light has filtered.—E. RITCHSON (in "Scientific American").

#### A Heavy Cantaloup.

I cut a Melon (Cantaloup Noir des Carmes) to-day which weighed 14½ lb. I have grown a lot of Cantaloups, but this is the heaviest that I have cut.—ARTHUR BOWMAN, The Gardens, Manor Heath, Halifax, July 18.

#### The Dahlia as a Vegetable.

The Dahlia is now cultivated in Europe for its flower, but according to a recent writer, it was first introduced there for its root as a vegetable. The Dahlia bulb, when roasted and eaten, is wholesome and a substitute for the Potato.

#### New Single Roses.

Three new Roses have just been placed on the market called Irish Brightness, Irish Pride, and Irish Star. Like the much-admired novelties of last year—Irish Glory, Irish Modesty, and Irish Beauty—the new Roses are perpetual flowering singles of great charm and beauty.

#### Orchids as Fodder.

In Chicago the other day a messenger boy put a basket of Orchids, worth £8, on the sidewalk while he attended to some other affair, and an old horse standing by made a meal of them. The Orchids were probably worth more than the horse; and that is the costliest thing in luncheons yet recorded in the annals of the stable.

#### Carnations.

The Carnation (*Dianthus Caryophyllus*) is one of the most interesting flowers of the garden, firstly because of its great variety, all having come from the little single-flowered species which is still preserved alongside its grandly developed descendants; and secondly, because of the beauty of the multifarious sorts and their characteristics in growth in habit. We figure to-day a selection of Flaked and Self Carnations. The Carnation is divided into three main groups by florists, viz., Bizarres, Flakes, and Selves. The Bizarres are sub-divided into crimson, pink, purple, and scarlet flowered; Flakes into purple, rose, and scarlet. Bizarres are variously coloured or spotted or striped with two or three distinct colours on a clear ground. Flakes have a pure ground, flaked with one colour only the entire length of the petal. Picotees are a section of Carnation classified according to the breadth and colour of the edging, and also the body-colour of the petals. Show, Stage, or Fancy Carnations are one and the same, and these are named yellow-ground or white-ground Fancies. The former are exceptionally beautiful.

The propagation of Carnations by layers is now being practised, though the work will not be general for a week or more. Cross-fertilisation for securing new seedling forms is very interesting work, and can now be undertaken.

#### Trees and Shrubs in an Isle of Wight Garden.

The following notes are sent by Captain Dawley, Buckingham Villa:—*Cæsalpinia japonica*, most beautiful, 18ft through, with forty blooms present time (June 25); *Edwardsia grandiflora*, flowered profusely in spring, 25ft high.

*Myosotidium nobile*, just out of flower, a fine plant; *Embothrium coccineum*, a young plant, doing well; *Lapagerias roseum* and *album*, under glass, against north walls and under trees, all vigorous in growth and flower.

*Lonicera Hildebrandti*, vigorous in growth, has not flowered; *Cistus formosus*, fine in bloom; *Carpenteria californica*; *Buddleias Colvilli* and *madagascariensis* each growing vigorously; *Physianthus albus*, flowers on west wall, vigorous; *Sollya heterophylla*, blooming in greenhouse, plant out of doors not yet flowered; *Calochorti*, very successful.

Bamboos making good growth; varieties: *nobilis*, fine specimen; *Simoni*, *nigra*, *viridi-glaucescens*, *nitida*, *Castlionis*, *Quiloi*, *henonis*, *palmata*, and *Arundinaria japonica*.

*Desfontainia spinosa*; *Photinia serrulata* and *P. japonica*; *Raphiolepis ovata*; *Crinodendron Hookeri*, just out of flower; *Bignonia grandiflora*; *Cypripedium spectabile*, strong clumps, very strong in bloom; *Mandevilla suaveolens*.

*Abelia rupestris* and *A. floribunda*; *Gerbera Jamesoni*, has flowered out of doors for four years; *Crinum*s and *Lilies* (varieties); *Poincinea Gilliesi*; *Disa grandiflora*, doing well, to flower in August; *Dimorphotheca Eckloni*, new composite; *Romneya Coulteri*; *Clematis Davidiana*; *Hedychium Gardnerianum*, out of doors; *Irises* in varieties; *Iris Kämpferi*; *Water Lilies*, varieties; *Lotus peliorhynchus*. All subjects appear to be thriving.

## Societies.

### Royal Horticultural, Drill Hall, July 21st.

The exhibition of the National Carnation and Picotee Society being held in conjunction with that of the "Royal" on this occasion, the latter's show was much limited. A very large number of visitors were present, and a paper on the horticultural aspects of New Zealand was read in the afternoon. This we shall give further notice in our next number.

#### Orchid Committee.

Messrs. Hugh Low and Co., Bush Hill Park, Middlesex, had *Cattleya Mendeli* varieties: *C. Harrisoni alba* (F.C.C. plant), *Lælia majalis*, and *C. Mossiæ Wagneri*. Thos. Rochford and Sons, Ltd., Turnford Hall Nurseries, had white flowered *Cattleya Gaskelliana*, and *Cattleya Mendeli* King Edward VII. (a pure white with an orange throat). Both the plants were much admired. Gurney Fowler, Esq., staged *Renanthera Storei* (a fine branching inflorescence of scarlet-crimson flowers), and also *Eulophiella Peetersiana*.

#### Fruit and Vegetable Committee.

The Fruit Committee had a number of small entries before them, particularly good being a dish of Peach *Libra*, exhibited by Mr. Taylor, of Hampton, Middlesex, a handsome fruit after *Barrington* type.

Messrs. Cross and Son, Daffodil Nurseries, Wisbech, staged Early Victoria Apple (quite green). Melon *Lilburn Favourite* came from Mr. R. Mathers, Abbey View, Kelso, but received no award. What was called Lemon Cucumber came from Hobbies Ltd. Gooseberry *Grouville Giant* ("a great bearer of very large dessert berries," and of grand flavour) came from Mr. H. Becker, Imperial Nurseries, Jersey, and this is a fine dark bronze yellow variety. Mr. H. Becker, of Jersey, sent Tomato *XL All* (a fine medium sized fruit).

Strawberry President *Loubet* from J. Veitch and Sons, Ltd., seemed a first-rate fruit, being large and very dark red. The fruits are firm. *Waterloo* and *Lord Napier* are the parents. Messrs. Veitch received a first-class certificate for a well-cultivated basketful of Loganberry fruits, quite an inch and a half in length, and of a rich dark crimson. The flavour is tart yet agreeable.

Messrs. John K. King and Sons, Coggeshall, contributed a goodly selection of culinary Peas, among which we noted *Centenary*, *Gradus*, *Daisy*, *Masterpiece*, *Mammoth Sugar*, and others to the number of fifty dishes. (Silver Banksian Medal.)

#### Floral Committee.

Messrs. W. Bull and Sons, King's Road, Chelsea, staged a collection of new *Fuchsias* in 6in-pots. The best varieties were *Lena*, *Muriel*, *Nautilus*, and *Julius*. It is strange to note how little improvement there is being made in this plant. The modern varieties are little, if any, better than those of a couple of decades ago.

Messrs. Phillips and Taylor, Bracknell, contributed a small exhibit of *Spiræas*, cut *Carnations*, and *Nymphæas*. The *Water Lilies* included *N. Sanguinea*, *N. M. Rosea*, *N. Gloriosa*, *N. Chromatella*, *N. Sulphurea*, *N. Lucida*, and *N. Carnea*.

From Messrs. J. Hill and Son, Barrowfield Nurseries, Lower Edmonton, came a nice exhibit of *Nephrolepis Fosteri*, a Fern likely to be useful for general decorative purposes, also a nice collection of *Adiantums* in small pots with a few forms of *Selaginellas*. (Silver Flora Medal.)

Ferns were again exhibited by Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, who staged thirty-six species and varieties of *Gymnogrammas*, chiefly in small pots. The most noteworthy being *G. multiceps*, *G. Alstoniæ*, *G. Mayi*, *G. grandiceps superba*, *G. chrysophylla superba*, and *G. elegantissima*.

An interesting exhibit of *Water Lilies* came from L. Currie, Esq., Minley Manor, Farnborough. The flowers were displayed in pans, with a background of Bamboos, and without doubt they were splendidly grown. The most conspicuous were *N. tuberosa*, *N. Marliacea carnea*, *N. M. albida* (in grand form), *N. Laydekeri lilacea*, *N. Ellisiana*, *N. M. Chromatella*, and *N. Laydekeri rosea*. (Silver Flora Medal.)

Messrs. Paul and Son, Cheshunt, contributed a fine display of new *Roses* arranged in vases. Though the exhibit contained many old forms, the new forms included *Lady Clanmorris*, *Frau Karl Druschki* (in grand form), *Lady Battersea*, *Billiard et Barre*, *Tea Rambler*, and *Bessie Brown*, the whole forming a fine exhibit.

From Messrs. Dobbie and Co., Rothesay, came a capital strain of the old fashioned Sweet William, known as the *Auricula eyed*. The strain is undoubtedly a good one, and selected with great care. The strain was commended.

Messrs. Jas. Veitch and Sons, Ltd., made an extensive and varied display. A group of *Java Rhododendrons*, beautifully flowered, attracted much notice, a few of the most noteworthy being *Ne Plus Ultra*, *Princess Alexandra*, *R. Javanicum*, *Lord Wolseley*, *Indian Chief*, *Imogene*, and *Monarch*. The herbaceous department was represented by a group of large bunches, in

which the following were noted as being especially good: *Draccephalum virginicum album*, *Achillea eupatoria*, *Centaurea ruthenica*, *Sidalcea Listeri*, and *Lythrum roseum superbum*. The same firm also contributed a nice display of Sweet Peas, in which all the leading varieties were represented. (Silver Flora Medal.)

*Begonias* were well represented by Messrs. H. Cannell and Sons, Swanley, who staged a nice collection of double varieties, in which were noted *Lady Esther Smith*, *Col. Plumer*, *Mrs. Thompson*, *Lord Stradbroke*, *King Humbert*, *Lady Dundonald*, and *Countess Bremer* as being the best. *Bedding Begonias* were also staged in 5in pots. The colours are clearly defined and the plants most floriferous.

From Mr. Amos Perry, Winchmore Hill, came a nice display of hardy flowers and *Water Lilies*. In the former were nice representative bunches of *Achillea millefolium rubrum*, *Lilium Parryi* and *L. Bloomerianum magnificum*, *Spiræas* in variety, and *Heuchera sanguinea* (Walker's var.). In the *Nymphæas* were to be found *N. Odorata Maxima*, *N. Gladstoniana*, *N. Gloriosa*, *N. Chromatella*, *N. Robinsoni*, *N. Marliacea carnea*, *N. M. albida*, and *N. Andreana*.

Messrs. Barr and Sons, Covent Garden, were represented by a fine exhibit of hardy flowers and a few *Nymphæas*. The best of the hardy flowers were *Phloxes* in variety, *Brodiaea Murrayana*, *Lilium Browni*, *L. Martagon dalmaticum*, and *L. Humboldtii magnificum*, *Astilbe sinensis*, *Iris Kämpferi* in variety, with *Gaillardias* and *Alströmérias* in variety, also a Japanese model garden.

A grand display of decorative *Roses* was that from Messrs. W. Paul and Son, Waltham Cross. The day evidently suited the *Roses*, for they were in grand condition, the most noteworthy being *Frau Karl Druschki*, in grand condition, *Enchantress*, *Madame Abel Chatenay*, *Madame Ravary*, *Souvenir de William Robinson*, *Souvenir de J. B. Guillot*, *Chamclean*, *Dainty*, *White Maman Cochet*, *Floribunda*, and last, but not least, a new *Tea*, *Earl of Warwick*, a *Rose* of great promise. The flowers are of good shape; cream flushed with rose will best describe the colour. (Silver Flora Medal.)

Mr. A. F. Dutton, The Nurseries, May Place Road, Bexley Heath, once more demonstrated his ability to produce tree *Carnations* in grand form. The blooms were staged in huge trumpet vases, and the varieties represented were *Mrs. T. W. Dawson*, *D. B. Crane*, *Royalty*, and *Madame Melba*. The exhibit created great interest amongst the gardening fraternity present.

A group of Sweet Peas came from Mr. Black, gardener to Lady Plowden, Aston Rowant, Wallingford. The blooms were undoubtedly good, but the absence of greenery in the jasper vases effectually killed anything approaching effectiveness.

Messrs. W. Cutbush and Son, Highgate, set up a pretty group of *Carnations* in pots arranged with Bamboos, Palms, and Ferns. The large semicircular group of *Malmaisons* included nice plants of *Nautilus*, *Princess of Wales*, *King Oscar*, *Lady Rose*, *President Loubet*, *Mr. Trelawny*, *President McKinley*, and *Monk*. The border varieties comprised a good collection, chiefly composed of yellow ground sorts. (Silver-gilt Banksian Medal.)

Messrs. J. Peed and Son, West Norwood, exhibited a group of *Carnations* in pots, nicely arranged with Bamboos and foliage plants, the most conspicuous of the *Carnations* being *Cecilia*, *Winnie Peed*, *Edward VII.*, and *J. C. Knight*. A few *Malmaison* varieties completed the display.

From Messrs. R. H. Bath, Limited, Wisbech, came a stand of *Carnations* in pots and in a cut state. The arrangement, however, was far below the average of R.H.S. exhibits. The best varieties were *George Alexander*, *Albatross*, *Lucifer*, *Trojan*, and *Volunteer*.

Messrs. James Veitch and Sons, Limited, Chelsea, made a nice exhibit of *Carnations* in pots, arranged with Palms and *Adiantums*. The most conspicuous varieties were *Galatea*, *Trojan*, *Charles Martel*, *Mrs. Charles Baring*, *Rizzio*, *Lord Roberts*, *Quintin Durward*, and *Argosy*.

#### Certificates and Awards of Merit.

*Asparagus plumosus cristata* (Sir T. Lawrence).—A heavily crested plumose form, inclined to fasciation. It can be grown dwarf and bushy. A.M.

*Begonia*, *Marie Bouchett* (W. Greenwell, Esq.).—A form of the *B. Boliviensis* type, with abundance of large, tassel-like, crimson-scarlet flowers on long sappy shoots. The plant was shown in a basket. A.M.

*Cypripedium* × *Uitor* (Sir F. Wigan, Bart.).—Parentage: *C. Lawenceanum* (female), *C. Sanderianum* (male). The long, narrow sepals of the latter are evident. The pouch is chocolate-brown, the dorsal sepal greenish with dark lines. A.M.

*Lælio-Cattleya* × *Bletchleyensis illuminata*.—Parentage: *L. tenebrosa* × *C. gigas*. The lip is very handsome and prominent, being velvety crimson, heavily suffused with mauve at the edges. The sepals and petals are rosy-mauve and bronzy. F.C.C.

*Lilium elegans*, *Peter Barr* (Barr and Sons).—A rich golden-orange form. A.M.

*Pteris metallica* (H. B. May).—From a general, superficial view, this resembles *Polypodium vulgare*. The foliage bears three pinrules on either side, the lower two joined, and is leathery, of a dark green colour. A.M.

## National Carnation and Picotee, July 21st.

The metropolitan, or home counties, section of the N.C. and P.S. held the annual exhibition in the Drill Hall, Westminster, along with that of the R.H.S., on Tuesday last. At the luncheon in the Hotel Windsor, Mr. Martin R. Smith, president of the society, who occupied the chair, said that this was certainly the finest exhibition the members had brought together, and competition, as our report shows, was exceptionally keen. The society has now four hundred members or thereabouts, and a good many have joined this year. The chairman referred to a disease that had affected his plants, whereby the flower stems rot off at the collar. He said the society had no one on whom to fall back for advice in such emergencies, but he did not name Drs. M. C. Cooke and W. G. Smith, or Mr. George Massee, each of whom do much honorary service in their special branches of botanical study. There were more people at the luncheon than we ever remember to have seen before.

### First Division.

For twenty-four Carnations, dressed on cards, bizarres and flakes, not less than twelve varieties, there were two competitors, both staging strongly. The first prize was awarded to F. Wellesley, Esq., Woking, who was undoubtedly in fine form. The varieties employed were G. Lewis (premier flake), J. S. Hedderley (premier bizarre), R. Houlgrave, Merton, George, Master Fred, Robert Lord, W. Skirving, Sportsman, G. Melville, Arline, Guardsman, J. D. Hex-tall, Admiral Curzon, T. Lord, and H. Shocsmith. M. R. Smith, Esq., Warren House, Hayes, Kent, was second, his best varieties being Adonis, Flavia, Elphinstone, Sweet Nell, Markham and Nestor, nearly all seedlings.

In the class for twenty-four selfs not less than twelve dissimilar varieties there were no less than six competitors, most of which were above the average quality. Martin R. Smith, Esq., Warren House, was placed first with a level exhibit. The varieties were Swashbuckler, Cecilia, Sir Bevy's, The Maid, Gulnare, Daffodil, Barras, Hildegard, Duke of Norfolk, Helen, Blanche, Kara, Floradora, Mrs. Eric Hambro, Agnes Sorrel, Bomba, Anne Boleyn, Waldemar, Roderic, and Don John. F. Wellesley, Esq., made a good second, the best varieties being Agnes Sorrel, Orpheus, Almoner, Mrs. A. Gilbey, Cecilia, Seymour Cochrane, and Benbow. Messrs. W. Artindale and Son, Ranmoor, Sheffield, were third; and Mr. C. Turner, Royal Nurseries, Slough, brought up the rear.

The premier class for twenty-four blooms, dressed on cards, Fancies only, there was a fine entry of six exhibits, Mr. F. Wellesley being a splendid winner for first place, the varieties being Hildago, Charles Martel, Monarch, Paladin, Argosy, Perseus, Amphion, Voltaire, Primrose League, Guinivere, Queen Bess, Gipsy Queen, Ormonde, Mrs. F. Wellesley, Ossian, and Charles Martel, a really grand exhibit. Mr. Martin R. Smith followed, his best varieties were Lily Duchess, Bedimere, Royal George, Athelston, Cavalier, Ramoses, and The Seer. Messrs. Blackmore and Langdon were third with a creditable display, and Mr. C. Turner brought up the rear.

Class 4 was for twenty-four Picotee blooms, dressed on cards,

Southampton Show: Eighteen distinct Roses. (See page 75.)

white grounds not less than twelve varieties. Here there were four entries, and the awful collars, so orthodox, and yet so atrocious, that they simply killed the ground colour, but it is to be hoped an alteration will shortly be made in this direction. Again Mr. F. Wellesley distinguished himself by leading off with a nice exhibit. The varieties were W. H. Johnston, Fortrose, Brunette, Amy Robsart, W. G. Dickson, Nellie, Ganymede, Muriel, Thos. William, Mrs. Payne, Somerhill, Clio, John Smith, Miriam, Favourite, and Fanny Tell. Mr. Martin R. Smith made a good second, his best varieties being Tip Top, Brownie, Miss Sophie Graham, Ganymede, Fortrose, and Lady Louise; Mr. Chas. Turner was third with smaller blooms, while Messrs. W. Tulpin and Sons, Newton Abbot, were fourth.

For twenty-four Picotees, dressed on cards, yellow grounds, there were again five entries. In this case Mr. Martin R. Smith secured first honours, with a fine exhibit, the varieties were Gronow, Badoura, Peri, Luey Glitters, Espoir, Isolt, Schiller, Chryseis, Verena, Launce, Leonora, Koh-i-Noor, Speranza, Dalkeith (premier yellow ground), Lord Napier, Sabrina, and Mrs. W. Heriot. Mr. F. Wellesley was a close second, the best blooms were Badminton, Gertrude, Heliodorus, Lady St. Oswald, and Mrs. Durant; Messrs. W. Artindale were third, and Mr. C. Turner brought up the rear.

For six self blooms, one variety, dressed on cards, there were six entries, Mr. Martin R. Smith being first with a good yellow, named Daffodil; Mr. F. Wellesley followed with nice blooms of Germania; Mr. C. Turner came third with Sir Bevy's, and Messrs. Artindale and Sons, Sheffield, fourth, with Much the Miller.

For six blooms, yellow or buff ground Fancy Carnations, there was a good entry of five, Mr. F. Wellesley first with Mrs. F. Wellesley in fine form; Mr. M. R. Smith being a good second with King Solomon; while Messrs. Blackmore and Langdon were third with Richness, a variety of grand colour; the fourth place falling to Messrs. W. Artindale and Son with good typical blooms of Monarch.

Class 8, for six blooms, dressed, other than yellow or buff, secured five entries, Messrs. Blackmore and Langdon being first with Millie; Mr. F. Wellesley being second with the same variety; Mr. M. R. Smith taking third with Ivo Sebright, while Messrs. Tulpin and Sons, Newton Abbot, were fourth with Persimmon.

Five entries were staged for six yellow ground Picotees, one variety, the first place being taken by Mr. Martin R. Smith with good blooms of Mrs. Walter Heriot; Mr. F. Wellesley was second with Lady St. Oswald; Messrs. Artindale and Son were third with Childe Harold, and Mr. C. Turner fourth.

Class 10 for twelve distinct varieties of selfs, yellow grounds and Fancies, without dressing or cards. There were six exhibits in this class, and they made a far better impression than the classes just enumerated. The blooms looked more natural, and certainly made a better display than their orthodox neighbours. The first prize was allotted to Mr. Martin R. Smith, whose varieties were Lucifer, Hengist, Red Rover, Berengaria, Cavalier, Cecilia, Comet, Hildegard, Goldlocks, Sir Bevy's, Orpheus, and Morning Star. The second prize went to Messrs. Blackmore and Langdon, who had Blanche, Richness, Alma, Argus, and Mrs. Wall in good form. Messrs. W. Artindale and Son were third, and

Southampton Show: Six distinct Roses. (See page 75.)

Mr. F. Wellesley appeared in a new rôle by being last on the list.

The competition in the classes for single blooms was rather appalling to the reporter, the first three winners are given in each case. For scarlet bizzarres the first position was taken by Messrs. Thomson and Co. for Robert Houlgrave; Mr. J. Butt was second with the same variety; Mr. B. Pash third with Admiral Curzon.

For crimson bizzarres Mr. F. Wellesley was first with J. S. Hedderley; Mr. J. Butt made a good second with the same variety, and also third with the same sort. In the pink bizzarres Mr. D. Walker was first with Wm. Skirving; Mr. E. J. Wootten was second with Sarah Payne, and Mr. F. Wellesley third with Wm. Skirving.

Purple flakes were good, and the competition keen, Mr. W. Spencer, jun., being first with Geo. Melville; Mr. J. Wootten second with the same variety, while Mr. Jas. Fairlie was third with Gordon Lewis. Scarlet flakes brought out a strong competition, the first prize bloom being Sportsman, exhibited by Mr. E. J. Wootten; Messrs. Thomson and Co. second with J. J. Keen, and Mr. B. Nash third with Sportsman. In the rose flakes Mr. W. Pemberton was first with Merton, and second also, while Mr. J. J. Keen was third with the same variety.

The self flowers staged as single blooms made a nice display. In the class for white or blush there were twenty-one entries, Mr. R. C. Cartwright came first with Ensign; Mr. A. J. Cook second with the same variety, and Mr. Cartwright third with Much the Miller. Rose or pink varieties also turned up in strong force, Mr. W. H. Parton, jun., being first with Lady Hermoine; Mr. W. J. Wootten being second with a deep rose seedling, and Mr. A. J. Cook third with Bomba.

Scarlet, red, or purple, brought out a heavy team. Mr. W. Spencer was first with a sport from John Wormald; Mr. R. C. Cartwright was second with a seedling, and Mr. D. Walker third with Sirdar. Maroons or purples were not so strongly represented, Mr. E. Charrington taking first with Helen, the same exhibitor being second with the same variety, while Mr. F. Wellesley was third with Mrs. W. Mostyn.

For yellow selfs Mr. E. J. Wootten came first with Almoner; Mr. E. Charrington being second with Germania, while Mr. W. Speneer, jun., was third with the same variety.

For buff varieties, Mr. F. Wellesley took first with Benbow; Mr. R. C. Cartwright taking second and third with the same variety.

The yellow-ground Fancies were extra good, and made a fine display. Mr. B. Nash was first with Monarch; Mr. F. Wellesley second with Mrs. F. Wellesley, and Mr. R. C. Cartwright third with Argosy.

Other Fancies were represented by Mr. D. Walker, taking first with Nestor; Mr. R. C. Cartwright being second with Artemus; and Mr. J. Wootten third with the same variety. Picotees formed a fine feature. The best three exhibits are given in each class for reds, heavy edged. Mr. B. Nash was first with M. D. Anstiss; Mr. J. J. Keen was second with John Smith; and Mr. W. Pemberton third with the same variety.

The light-edged rose or scarlet varieties were strongly staged, Mr. E. J. Wootten being first with Favourite; Mr. W. Spencer followed with the same variety, and Mr. F. Wellesley. The purple heavy-edged varieties were strongly in evidence. Messrs. Thomson and Co. were first with Fanny Tett, Mr. W. Pemberton was second with Amy Robsart, and the third fell to Mr. J. Butt with Fanny Tett.

The light-edged purple varieties were not so numerous. Mr. F. Wellesley being first with Somerhill, Mr. J. Wootten second with Pride of Leyton, and Mr. J. Butt third with Lavennia. Rose or scarlet heavy edges found Mr. J. Wootten first with Fortrose, Mr. J. Pemberton second with Lady Louise, while Mr. W. Spencer, jun., was third with Mrs. Payne.

The yellow ground varieties were superb. The heavy-edged varieties were extremely strong, Mr. J. J. Keen winning first place with Gronow, Mr. M. R. Smith being placed second with Dalkeith; presumably the same exhibitor was third with the same variety.

In the class for light-edged varieties there was also a good competition. Mr. M. R. Smith being first with Lady Hewitt. The second prize had been awarded, and the exhibitor's card scratched off. Mr. B. Nash following with Heliodorus.

For light-edged reds Mr. J. J. Keen was first with Thos. William, Mr. W. Spencer was second with the same variety, Mr. J. Bull third with Grace Darling.

#### Second Division.

In the second section there were three entries for twelve Carnations, bizzarres and flakes. Messrs. W. Pemberton, Bloxwich, securing first position with a good level board. The varieties staged being J. D. Hextall, Flamingo, Gordon Lewis, Merton, George Melville, Robt. Houlgrave, Wm. Skirving, J. S. Hedderley, Sportsman, Chas. Henwood, Mrs. Rowan, and Geo. Rudd. Mr. W. Spencer, jun., Windsor, was second, his best flowers being Geo. Melville, J. Wormould, and Robert Houlgrave; while Messrs. Thomson and Co., Birmingham, came third.

Class 16 was for twelve blooms, distinct varieties. Here

there were six competitors, Mr. W. Spencer, jun., being first with good representative flowers of Almoner, Barras, Sultan, Helen, and Britannia. Messrs. Thomson and Co. were a good second with Enchantress, Nubian, Mr. Eric Hambro, and His Grace; Messrs. Phillips and Taylor being third.

For twelve Fancy varieties there was again a good entry, Mr. W. Spencer, jun., being first with excellent blooms of Paladin, Voltair, Argosy, Ormonde, and Monarch. Messrs. Thomson and Co. came next, having Argosy, Emperor, Jessie Done, Voltaire, and C. B. Thomson for their flowers. Messrs. Phillips and Taylor being third.

For twelve white ground Picotees there was a good entry of five, Mr. B. Nash, Woking, coming to the front with nice blooms of Mrs. Beswick, Fanny Tett, Little Phil, M. D. Anstiss, Ann Lord, and Mrs. Payne. Messrs. W. Pemberton and Son, Walsall, was second with good clean examples of W. H. Johnston, Fortrose, Charles Hardman, Mrs. Beswick, Gannymede, and Amy Robsart. Mr. W. Spencer was a good third.

For twelve yellow-ground Picotees, distinct varieties, Mr. B. Nash was placed first with a good level box containing Heather Bell, Lady Bristol, Evelyn, Mohican, Hesperia, and Lauzan. Messrs. Thomson and Co. were second, and Mr. W. Spencer, jun., third.

The competition for six self blooms, one variety, was confined to six competitors, Mr. W. Speneer, jun., being first with Mrs. Eric Hambro, while the second prize went to Mr. B. Nash with the same variety, the third prize falling to Messrs. Phillips and Taylor for a yellow not named on the card.

For six blooms, yellow or buff ground, one variety, Mr. W. Spencer, jun., came first with Voltaire in splendid form. Mr. B. Nash was second with Mrs. Tremayne, while Messrs. Thomson and Co. brought up the rear with Voltaire.

The Fancy varieties were not so strong, the first prize going to Messrs. Phillips and Taylor for Ivo Sebright. The second to Mrs. Brookes-Smith, St. Mary's Church, Devon, for Mrs. Brookes-Smith, while Mr. W. Spencer, jun., was third with Muleteer.

The yellow-ground Picotees were represented by six competitors. Mr. H. W. Mathias, Thames Ditton, being awarded first for the Pilgrim, Mr. B. Nash second with Heliodorus, and Mr. W. Speneer, jun., third with Lady St. Oswald.

The six varieties, selfs, Fancies, and yellow-grounds, three blooms each, arranged without any dressing, was decidedly attractive, Mr. S. Morris, Wretham Hall, Thetford, was first, staging in fine style. The varieties were Hildegard, Cecilian, H. J. Cutbush, Daniel Defoe, Hesperia, and Agnes Sorrell. Mr. W. Speneer, jun., was a capital second with Mrs. Trelawny, Eldorado, and Hesperia. Messrs. Thomson and Co. were third.

Mr. C. Turner, Royal Nurseries, Slough, was the only exhibitor in class 48 for a group of Carnations to occupy 50 square feet. The exhibit was awarded second prize.

The competition for brides' and bridesmaids' bouquets was confined to two competitors. Mr. Martin R. Smith secured premier award, while Miss D. Olliver, Tollington Park, came second.

There were five entries for a single vase, Mr. M. R. Smith being placed first for a vase of mixed varieties. Mrs. Hadley, Reigate, came next, while Mr. W. Spencer, jun., was third.

The class for three sprays was well represented, but there was nothing as striking as would have been seen in the nearest florist's window. The first prize went to Mr. W. Spencer, jun., the second was secured by Miss D. Olliver, and the third by Mr. Martin R. Smith.

The buttonholes were a strong class, but Mr. M. R. Smith came first, and Mr. W. Spencer, jun., and Mrs. Hadley followed in the order named.

#### Certificated new varieties

*Carnation, Mrs. F. Wellesley* (F. Wellesley).—A good yellow ground Fancy, deeply edged and flaked with shades of red. F.C.C.

*Carnation, Speranza* (Martin R. Smith).—A beautiful yellow ground, edged with rose. F.C.C.

*Carnation, Richness* (Messrs. Blackmore and Langdon, Bath).—A Fancy yellow ground variety, richly edged and striped with crimson. F.C.C.

*Carnation, Ivo Sebright* (M. V. Charrington).—A good rose variety, edged and slightly flaked slate. F.C.C.

#### Third Division.

Class 25.—For six bizzarres and flakes James Fairlie, Acton, led with the usual sorts; second, D. Walker, Kilmarnock, N.B.; and third, W. E. Wilson, Cannock, there being eight entries. For the six selfs (class 26) there appeared to be fifteen fine entries, the lead going to Mr. Cartwright, of King's Norton; second, D. Walker; and third to H. Parton, jun., King's Norton.

For three Fancies, the order ran thus: Messrs. Charrington, J. Fairlie, and R. C. Cartwright; there being eleven lots. Thirteen sets, however, were forward in class 32, for three Fancies, other than yellow or buff. Mr. Charrington was a splendid first, Mr. Philbrick second, and Mr. Cartwright third. Three yellow-ground Picotees saw Mr. Charrington leading, Dr. A. H. Beadles second, and Mr. Philbrick third. Mr. Cartwright was easily first for three-trebles in any section, Mr. Walker coming second, and Mr. J. Fairlie third.

(Remainder of report next week.)

### National Rose, at Glasgow.

The west of Scotland rosarians were fortunate in securing the assistance of the National Rose Society, to aid in holding their exhibition this year. The headquarters of the West of Scotland Society is at Helensburgh, where an exhibition is held annually in July. No doubt the show to have taken place this year would have been in Helensburgh, but it was noticed beforehand that with the National Society joining its forces, there would not be sufficient hall space in that town. A good idea struck the directors, and to get out of the difficulty it was proposed to make Glasgow the centre, and they were fortunate to secure the St. Andrew's Hall there.

The exhibition of Roses on Wednesday last (July 15) was one of the finest ever held in Scotland. The grand hall was a blaze of colour from the wealth of blooms staged. The season, so far, has been a late one, and not only late, but a very curious season all through. The objectionable part of the year was in April, when frost to the extent of 22deg was registered, and snow covering the ground, caused the first shoots to disappear. With such a disastrous early spring, from the exhibition seen last week, one could scarcely have dreamed that such weather had prevailed, which clearly shows that the Rose is a very hardy plant.

It is now sixteen years ago since the N.R.S. came to Scotland, but why should it not come oftener?

**NURSEYMEN'S SECTION.**—For thirty-six blooms, distinct, the Jubilee Challenge Trophy was carried off by Messrs. Harkness and Co. Their blooms were exquisite, and deliciously arranged. Their back row had (reading from left to right) Mildred Grant, Gustave Piganeau, Bessie Brown, Ulrich Brunner, Madame Lambert, Mrs. Harkness, Her Majesty, Marie Baumann, Madame Marie Verdier, Marie Rady, Lady Mary Fitzwilliam, and Madame Charles Crapelet; second row: A. K. Williams, Maman Cochet, Horace Vernet, Maréchal Niel (fine), Comte de Ludre, K. A. Victoria, Madame Cusin, Souv. d'E. Vardon, Prince Arthur, White Maman Cochet, Fisher Holmes, and Ellen Drew; front row: Mrs. Cocker, Louis Van Houtte, Mrs. Jno. Laing, Duke of Edinburgh, Killarney, Duke of Wellington, Marchioness of Downshire, Jean Soupert, Mrs. Ed. Mawley, Victor Hugo, Niphetos, and Ulster. The second prize fell to Messrs. Benjamin R. Cant and Sons, Colchester, who had a very good stand. They had the following varieties: Her Majesty, Ben Cant (silver medal), Maman Cochet, Caroline Testout, Suzanne Marie Rodocanachi, Mildred Grant, Lady Moyra Beauclerc, Count de Nadaillac, Chas. Lefebvre, Papa Lambert, and Ulrich Brunner; middle row: A. K. Williams, Maman Cochet, A. Carrière, Mrs. Jno. Laing, Marie Baumann, Frau Karl Druschki, François Michelin, Maréchal Niel, Duke of Edinburgh, Madame Cusin, Dupuy Jamain, and Bessie Brown; front row: Duchess of Portland, Fisher Holmes, Jean Ducher, Duchesse de Morny, Mrs. Cocker, Black Prince, Marchioness of Londonderry, M. Bernardin, Medea, Reynolds Hole, Killarney, and Horace Vernet. The third place fell to Messrs. A. Dickson and Sons, Royal Nurseries, Newtownards, who had a good stand, the best noticeable being Ulster (very good), Ulrich Brunner, Bessie Brown, Madame Cusin, Comtesse d'Oxford, Duchess of Portland, Frau Karl Druschki, and Maman Cochet.

Southampton Show: Twelve distinct Roses. (See page 75.)

For forty-eight blooms, the Messrs. Dicksons' had the first place, showing extraordinary blooms of fine colour and form. The second prize was awarded to Messrs. R. Harkness and Co. for a heavy stand comprising Robert Scott, Aliee Lindsell, Duchess of Portland (really splendid), Comtesse Ludre, and C. Bernardin. Messrs. D. Prior and Sons, Colchester, had the third place, their best being Killarney, Xavier Olibo (extra fine), Duchess of Portland, Duke of Edinburgh, Mamie, and Her Majesty.

For twenty-four distinct trebles, Messrs. Harkness led with nice blooms of Mrs. E. Mawley, Niphetos, Gustave Piganeau, White Maman Cochet, Mildred Grant, Mrs. Cocker, Killarney, C. Testout, Bessie Brown, M. Brownhouse, Madame Crapelet, G. Harkness, Lady Mary Beauclerc, and Alfred Colomb. Messrs. A. Dickson and Sons followed with a good second exhibit, their best being Mildred Grant, Lady Mary Beauclerc, Tom Wood, Mrs. Ed. Mawley, Lady Clanmorris, Frau Karl Druschki, Ulster, and Bessie Brown. The third ticket was secured by The King's Acre Nurseries, Hereford, in the stand being nice blooms of Mildred Grant, Frau Karl Druschki, Mrs. Ed. Mawley, Mrs. John Laing, and Maman Cochet.

In division B., for thirty-six blooms, fine flowers were to be seen, and here Messrs. Townsend and Sons, Worcester, had first points. Messrs. J. Jefferies and Son, Cirencester, came second with great quality, the set comprising M. Grant, Silver Queen, F. A. Lesseps, Ulster, R. Jacobs, Baron Bonstettin, A. Colomb, Heinrich Schultheis, Lady Moyra Beauclerc, B. Joubert, and Maman Cochet. For third prize, Messrs. David Robertson and Co., Mossend Nursery, Helensburgh, had the right award, securing a place for the Scottish nurserymen in the show. With such weather conditions he has suffered from it was gratifying to see such magnificent stuff in his stands. He had extra fine blooms of Medea, Mrs. Ed. Mawley, C. Testout, Duchess of Portland, Mildred Grant, and Madame Marie Verdier.

In the same division for sixteen distinct varieties, three blooms of each, Messrs. Townsend had the place with creditable blooms, staging the popular sorts such as we have named. For second place, Mr. Geo. Prince, Oxford, won; and Messrs. Jno. Jefferies and Sons took the third ticket.

Coming to the Tea and Noisette section Mr. Prince had the first award for the class of eighteen distinct, staging his usual fine specimens of White Maman Cochet, Ernest Metz, Comtesse de Nadaillac, Innocente Pirola, C. Koch, Maman Cochet, Muriel Graham, Mrs. Ed. Mawley, Miss E. Brownlow, Medea, Souv. de S. A. Prince, La Boule d'Or, Golden Gate, and E. V. Hermania. Messrs. F. Cant and Co., Colchester, ran second place, having good blooms of Bridesmaid, E. de Lyon, M. Cusin, Jean Ducher, Madame de Watteville, Madame Hoste, and F. Kruger. Messrs. D. Prior and Son took the third ticket with fine specimens of Mrs. Ed. Mawley, and Cleopatra.

For twelve blooms, in same section, Messrs. J. Jefferies easily had the first place, Messrs. Hugh Dickson second, and Mr. J. Mattock, Oxford, third; and among their specimens we noticed extra blooms

Southampton Show: Nine distinct Roses. (See page 75.)

of C. Koch, Comtesse de Nadaillac, Mrs. Ed. Mawley, and C. Mermet.

In the open section for nurserymen and amateurs, there was keen competition, and extra quality of blooms were staged. For twelve new Roses, Messrs. Alex. Dickson were placed first with W. Shean, Mildred Grant, Comaught, Dean Hole, Alice Lindsell, Florence Pemberton, Westminster, Alice Graham, Edith D'Ombraïn, Duchess of Annesley, Duchess of Portland, and Lena. Messrs. Frank Cant and Co. were placed second, and had Muriel, G. Harkness, L. Poiret, Boadicea, Duchess of Portland, Mamie, E. D'Ombraïn, Souv. de Pierre Notting, Lady Moyra Beauclerc, M. Grant, Boadicea, and Frau Karl Druschki. The third place fell to Messrs. B. R. Cant and Sons, who had extra blooms of M. Guillot, M. Grant, Frau Peter Lambert, Madame H. Bengier, P. von Goldenberg, Ben Cant, Frau Karl Druschki, Beauty, E. D'Ombraïn, and Duchess of Portland.

For twelve of any white or yellow Rose, Messrs. Alex. Dickson and Son led with Bessie Brown; Mr. Hugh Dickson, who was second, had Duchess of Portland; and Mr. Prince had good specimens of White Maman Cochet. In the class for twelve of any light pink or rose-coloured variety, Mr. Prince secured first place with Mildred Grant; Messrs. F. Cant and Co. came second with the same; and Mr. Hugh Dickson staged good blooms of Ulster, scoring third.

For twelve of any light or dark crimson, Messrs. B. R. Cant and Sons staged first, having Ben Cant on the stand, which is indeed a very pretty Rose. Messrs. Townsend had second place with X. Olibo, which was admirably shown; and Messrs. Alex. Dickson got the third place.

The exhibition Roses in vases were a feast of magnificent specimens. For twelve, distinct, to include not more than six varieties of Teas or Noisettes (space 6ft by 4ft), Mr. Prince was first; Messrs. A. Dickson and Sons second; with Messrs. Townsend following.

For new seedlings, in not less than three trusses, the gold medals and cards of commendation fell to Messrs. A. Dickson and Sons, Messrs. B. R. Cant and Sons, and Hugh Dickson. Messrs. A. Dickson staged Mrs. David McKee, a yellow Hybrid Tea, which is indeed a most promising variety.

Messrs. B. R. Cant and Sons staged a new climbing Polyantha named Blush Rambler, an admirable addition to this class.

#### NEW ROSES.

Mr. Hugh Dickson had a Hybrid Perpetual Rose named after himself. It is a very bright and brilliant scarlet-crimson, very intense. A card of commendation was also awarded to Mr. Hugh Dickson for a new Hybrid Tea, J. B. Clarke, a very deep crimson, very heavy veined with blackish maroon; growth vigorous, possessing well formed buds with massive foliage. It is a much-needed variety, and a great future lies with this Rose.

Mr. Dickson also staged a new Garden Rose named Dorothy, which is a splendid sort, possessing the type of Caroline Testout.

A card of commendation also fell to Messrs. A. Dickson and Sons for a splendid new Tea named Dean Hole, a most beautiful Rose; and for a Hybrid Tea, Duchess of Westminster, a very promising variety indeed.

For twelve Teas, distinct, three blooms of each, Mr. Prince staged first class blooms, and deserved the lead; while Mr. F. Cant came second, with Messrs. A. Dickson and Sons following.

In the "Garden" or decorative section many fine specimens were exhibited, and were greatly admired. Exhibits in this section are arranged so as to show as far as possible the foliage and habit of growth of each variety. Every fine type of the Polyantha, Moss, Provence, and single flowered varieties were staged. For eighteen distinct varieties Mr. J. Mattock had first award, staging Mme. Falcot, Amazon, Homère, Lady Battersea, Marjorie, Mad. A. Chateau, Jules Grolez, Sov. de Cath. Guillot, Marquis de Salisbury, Helen, Liberty, Lucida Plena, W. A. Richardson, Irene Watt, Papillon, Killarney, Crimson Rambler, and Macrantha. Messrs. F. Cant and Co. received second award; the third place fell to Messrs. Paul and Son, Cheshunt, Herts, who staged a fine stand of Perle d'Or, Rubin, Camoens, and White Pet.

#### AMATEURS.

AMATEURS.—In the amateur section there was a great display, and the finest of all Roses were to be seen. Some time elapsed before judgment could be given in many classes. In these classes all the Rose champions had entered. For twenty-four blooms the challenge trophy fell to Mr. E. B. Lindsell, Hitchin, who staged an enormous, weighty stand, which possessed fine colour. In this stand the silver medal of the National Rose Society was awarded to Victor Hugo, which was a "beauty." Pressure on our space prevents us giving the names of all the varieties, but the best were Robt. Scott, Frau Karl Druschki, Grand Mogul, Prince Arthur, Duchess of Portland, and Marchioness of Londonderry. The second place was given to Mr. Conway Jones, Gloucester, who also staged a grand stand; Mr. H. Machin was placed third. For thirty-six, distinct, Rev. J. H. Pemberton, Essex, had first place with an extra fine stand; Mr. Lindsell was placed second, while Mr. Jones came third. In the other amateurs' open classes, good exhibits were seen, and the fore-named were the chief winners. Mr. R. Park, Yorks, was awarded a first, Mr. W. Boyes, Derby, a second. Mr. R. Foley Hobbs,

Worcester, came first for eighteen, while Mr. Mawley ran close second, and Mr. Whittle, Leicester, third.

For twelve blooms, distinct, Mr. R. L. Garnett, Lancaster, got first place; Mr. G. Moules, Hitchin, getting second, and Mr. A. Gray, jun., Dalry, Scotland, third. For six distinct, first prize was awarded to Mr. H. Adamson, Bedale; while Mr. W. Upton, Leicester, got second, and Miss Nina Dickson, Newby-bridge, received third. For six blooms of any Rose except T. or N., Mr. F. A. George, Worcester, ran first; and Mr. Upton followed; with Mr. Adamson third.

In the class of new Roses, six distinct, Mr. Jones excelled, and Mr. Whittle had a close second, with Mr. W. K. Gair, Falkirk, third. For twelve blooms, distinct, three trusses of each, Rev. F. R. Burnside, Essex, had first; Mr. Jones following second. For nine blooms, distinct, Mr. Hobbs was first, Mr. Whittle second; and for six blooms, Mr. Upton led, and Rev. R. T. Langtree, Grange-over-Sands, second.

In the extra classes for amateurs for six distinct, three of each, Rev. Mr. Burnside scored; Mr. R. Park, Bedale, getting second, and Mr. Jones following third. For six blooms of any one variety, Mr. Moules succeeded; Mr. Hobbs having second, and Mr. Whittle third. For twelve distinct, three of each, Rev. Mr. Pemberton and Mr. H. Machin, Worksop, were placed equal, both having good exhibits. For six distinct, three of each, Mr. Mawley got first.

#### LOCAL SECTION.

The local section (confined to Scottish members) had heavy entries, but the weather apparently had interfered with their blooms, as not a few who had entered were unable to stage. In Scotland of late the weather has been very disastrous, and there are many rosarians who have not yet up to this time been able to cut a bloom. It is to be hoped, however, that their reward will be forthcoming shortly. For eighteen distinct varieties Mr. J. D. Bennett, Helensburgh, had the first place with very fresh blooms, his best being Marchioness of Londonderry, Alf. Colomb, Baldwin, Mrs. Jno. Laing, Souv. du Pres. Carnot, Antoine Rivoire, and K. A. Victoria. The second place was given to Mr. John Russell, Newton Mearns, who had also a good stand, his best being Bessie Brown, Mildred Grant, K. A. Victoria, Marquis Litta, Gustave Piganeau, and Général Jacqueminot. The third place was given to Mr. P. Farquhar, Helensburgh. For twelve distinct varieties, Mr. Black, Kinglassie, Fifeshire, secured the piece of plate given by Rev. Mr. Pemberton, with good blooms of C. Testout, La France, Catherine Mermet, V. Folkestone, Gustave Piganeau, Marquis Litta, Helen Keller, Miss E. Richardson, Mrs. Jno. Laing, Mrs. W. G. Grant, Souv. de S. A. Prince, and K. A. Victoria.

#### MEDAL BLOOMS.

Six of the National Society's medals (for best blooms) were awarded, being equally divided between the two classes of exhibitors. The two for Teas were won respectively by Messrs. D. Prior and Sons, Colchester, and the Rev. F. R. Burnside, both with the White Maman Cochet; the two for Hybrid Perpetuals fell to Messrs. B. R. Cant and Sons, Colchester (Ben. Cant) and Mr. E. B. Lindsell (Victor Hugo); and for Hybrid Tea Rose, to the King's Acre Nurseries, for Mildred Grant.

The exhibition was formally opened by the Lord Provost, Sir John Ure Primrose, Bart. The chair was occupied by ex-Provost Mitchell, of Helensburgh, who introduced the Lord Provost, who said he had many varied duties to perform, but he could hardly imagine anyone more delightful than that of opening a Rose show, where there were so many beautiful flowers.

He believed he was justified in saying that in the long history they never had a show that excelled the present one, and very few that equalled it. Even in the sunny south, the Roses this season did not present such perfect beauty as they saw that day, and they in Glasgow congratulated themselves in having gathered, in St. Andrew's Hall, so many perfect specimens. After referring to the pleasant occupation of Rose growing, he said it had its commercial aspect as well. He congratulated the society on its efforts, and he hoped that in their mission of preaching and teaching the gospel of beauty, they would have abundant success. At the close of Sir John's speech, Mr. Mawley briefly addressed the audience.

#### Speeches at Luncheon.

After judging, the directors, judges, and friends dined together in the Grand Hotel, ex-Provost Mitchell, Helensburgh, presiding. After dinner, the following toasts were proposed: "National Rose Society," by ex-Provost Mitchell, replied to by Mr. Mawley; "West of Scotland Rosarians' Society," proposed by Mr. Mawley, replied to by Mr. Spalding, late secretary of the society; "The Judges," by Mr. J. Hood, one of the directors of West of Scotland Society, replied to by Rev. Mr. Pemberton. In the course of his reply Mr. Pemberton referred to the hard work that lay before the judges that day, and stated in some classes it was the toughest fight he had seen. The Roses on this occasion were of the finest character, and even surpassed those exhibited at Bath and Wolverhampton this year. He spoke of the fine colour of the Perpetuals, and there were some there that day, he stated, he had not seen so fine before, especially Reynolds Hole, which was simply exquisite. He also referred to the Hybrid Tea section, and said he thought too many new varieties

were now being produced. We had too few of the darker Perpetuals. "What is wanted," he continued, "is a dark red Bessie Brown and a few Horace Vernets." In conclusion, he referred to two of the newer Roses—Bessie Burnside and Mrs. David McKee—and said that a bright future lay before them. On Mr. Mawley proposing a vote of thanks to the chairman, the company dispersed.

There was a fair attendance of visitors during the day, but as the evening drew near more people began to come in. It was suggested by someone that a little more money might have been spent in advertising the show. This lack of advertising possibly accounted for the meagre attendance during the daytime. The weather, of course, was not of a genial character, but even that does not affect those who are true lovers of the Rose, especially the Scottish people, who are so much used to daily changes in the weather!

The band from the Clyde training ship "Empress" was present, and rendered popular selections, which were highly appreciated.

Messrs. Dobbie and Co., Rothesay, exhibited beautiful stands of Sweet Peas, Pansies, and Violas, and Pelargoniums, double and single Zonals.

Mr. Matthew Campbell, of Blantyre, also exhibited some fine specimens of his latest Carnations.

### Ipswich, July 15th.

This show was held as usual in the Upper Arboretum, and was favoured with very fine weather and a good attendance. The trade growers showed poorly, possibly because of the N.R.S. northern exhibition at Glasgow being on the same day, but amateurs mustered more strongly than usual, Mr. Orpen's fine exhibits adding much to the beauty of the show.

In the open classes D. Prior and Son led pretty easily with thirty-six, showing Bessie Brown and White Maman Cochet well.

F. Cant and Co. second, with smaller flowers. The same order was observed in twelve trebles, but the competition was closer; besides the flowers mentioned, Messrs. Prior had good triplets of Frau Karl Druschki and Horace Vernet. In twelve Teas the order was reversed, F. Cant being first, having both Maman Cochet in good order, and Messrs. Prior second. For six similar H.P.'s or H.T.'s, Messrs. Prior were first with Bessie Brown, and Frank Cant second with Mildred Grant. In six similar Teas, Mr. Orpen was easily first, with a magnificent box of White Maman Cochet, Prior second with Maman Cochet, and F. Cant third with the white variety. In Garden Roses, Hon. W. Lowther was first and L. Holden, Esq., second.

In the amateur classes, Rev. A. Foster-Melliar was first for twenty-four, having good blooms of Frau Karl Druschki, Mildred Grant, Mamie, Mrs. J. Laing, Duchesse de Morny, and Countess of Caledon. Mr. Orpen was second with smaller and poorer, but much better set-up flowers, of which the best were perhaps White Maman Cochet and a small specimen of Liberty. R. Steward, Esq., of Norwich, third. For twelve Mr. Orpen was first, with Mrs. Sharman Crawford and Maman Cochet as his best, Rev. H. A. Berners second, and Mr. Foster-Melliar third, with a good Lady Moyra Beauclerc. In six trebles Mr. Orpen was first, having good triplets of the two Mamans and Bessie Brown, Mr. Berners second, and Mr. Steward a good third.

In twelve Teas, Mr. Orpen was first with a neat box, having clean samples of Mad. Cusin and White Maman, Mr. Foster-Melliar second with larger but much less neat flowers, among them a good Golden Gate, a very large La Boule d'Or, with the colour rather gone, and a neat specimen of the new Boadicea. Mr. R. Curtis, of Morningford, was third. In six similar H.P.'s or H.T.'s Mr. Steward was first, Mr. Orpen second, and Mr. Foster-Melliar third, all showing Bessie Brown. In six similar Teas, Mr. Orpen was first, Mr. Berners second, and Mr. Curtis third, the first named showing White Maman Cochet, and the others the coloured variety.

In judging the dinner table decorations, which consisted of two classes, open and local, the committee, possibly mindful of some badgering they may have received on previous occasions,

hit on the novel expedient of allowing the public—all visitors to the show—to judge them themselves by ballot. From the practical point of view of encouraging interest in the matter, and at the same time relieving anyone of responsibility, it seems a happy thought, though perhaps hardly fulfilling the flower show ideal of educating the public taste. In the result the win was easy in the open class, Miss Lister receiving 287 votes, against 174 and 107 for the second and third. But in the local class it was a very near thing, Miss E. M. Corder getting 151 votes, and Miss M. Cubitt 150, the third following with 118. I do not know whether Miss Cubitt "called for a scrutiny," as would doubtless have been the case at a Parliamentary election; but I do know that if the voting had come out equal as it so nearly did, and I had been a member of the committee, I should promptly have resigned my office and gone home.—W. R. RAILLEM.

After the Roses, the most attractive feature of this show is the collections of herbaceous plants. The principal class for thirty-six bunches brought only two competitors, Mr. C. Jacobi, Henley Road Nursery, Ipswich, and Mr. R. C. Notcutt, The Nursery, Woodbridge, who secured the awards in the order named. Mr. Jacobi showed a grand bunch of *Lilium testaceum*, also *Iris Monnierii*, *Alströméria chilensis*, and *Oenothera Fraseri*, in good condition. The second prize collection contained good bunches of *Thalictrum glaucum*, *Campanula lactiflora*, *C. persicifolia Moorheimii*, and *Callirhoe lineariloba*, a pretty malvaceous plant with purple flowers.

In the amateur class for twelve bunches there was a good competition, but not one of the collections was named, which considerably detracted from their educational value. The first went to the Hon. W. Lowther, Campsea Ashe (gardener, Mr. Andrews), for a fine exhibit, which included some lovely flowers of *Ostrowskya magnifica*, likewise nice bunches of *Centauria ruthenica*, *Delphinium nudicaule*, and *Iris Kämpferi*. Sir C. Domville, Bart., The Chantry, Ipswich (gardener, Mr. Creek), was second with a fresh exhibit.

Sweet Peas were much in evidence, several classes being set apart for them. In the majority of cases the staging was too formal. For twelve varieties, the Rev. G. Hooke, Clopton Rectory, was first, and Mr. E. Abbot, Railway Nurseries, Ardleigh, second.

Pot plants were not numerous, and call for no special notice, with the exception of the groups. For a group occupying a space of 100 square feet, Mr. A. Creek, The Chantry, was far ahead of all competitors, with a very effective arrangement of well coloured *Codiceums*, *Acalyphas*, *Celosias*, and *Francoas* upon a groundwork of Ferns. The background of tall plants of *Grevillea robusta*, and *Humea elegans* was the weakest spot in an otherwise excellent group. Mr. R. C. Notcutt was second, and Mr. H. J. Southgate, St. Helen's Nurseries, Ipswich, third.

Considerable interest was evinced in the classes for table decoration, owing to the innovation of public judging by ballot, between the hours of two and four o'clock. In the open class, Miss Lister was first with 287 votes for a pretty arrangement of Perle d'Or Roses, *Gypsophila*, and *Smilax*; while Miss M. Snell ran in second with 174 votes, using a single pink Rose and *Asparagus plumosus* with excellent effect. In the other class, closed to lady amateurs of Ipswich, there were nine entries, the prizewinners being Miss Corder, Miss Cubitt, and Mrs. Hubbard, who received 151, 150, and 118 votes respectively. The leading table was very tastefully decorated with pale pink Sweet Peas and Carnations, relieved with Maidenhair Fern. Most of the gardeners' votes, however, went to the second prizewinner, who put up a charming arrangement of *Begonia semperflorens*, and *Gypsophila*.

Fruit was very poorly represented. Only one collection of six dishes was staged, the first prize going to the Hon. W. Lowther, who showed Black Hamburgh and Buckland Sweet-water Grapes in poor condition, Ringleader Melon, Barrington Peaches, Pitmaston Nectarines, and Waterloo Strawberries. For black Grapes Sir C. Domville was first, with Black Ham-

Southampton Show: First prize collection of vegetables. (See p. 75.)

burgh, while for white Grapes the Right Hon. J. Round, M.P. (gardener, Mr. Bishop), secured the award with Muscats. For Peaches Lord Rendlesham (gardener, Mr. Rogers), was first with a grand sample of Royal George, the like award for Nectarines going to a well-coloured dish of Humboldt, shown by Sir C. Domville.

Amongst the non-competitive exhibits one could not fail to notice the very effective display of Roses staged by Mr. R. C. Notcutt. All the best varieties of H.P.'s and H.T.'s were represented, being cut with long stalks and informally arranged in glass bowls amidst a setting of Maidenhair Fern. Large bunches of Crimson Rambler intermixed with Palms were used as a background. Messrs. W. Cutbush and Son, Highgate Nurseries, were well to the front with an exhibit of cut flowers of Malmaison and border Carnations in several choice varieties. From Messrs. Fred Smith and Co., Woodbridge, came an attractive collection of hardy perennials and annuals, together with a nice assortment of Sweet Peas. Mr. E. Abbot, Ardleigh, likewise made a speciality of Sweet Peas. The show was favoured with lovely weather, and it is satisfactory to know was a financial success.—E. C.

### Highgate Horticultural, July 16th.

The more one sees of the districts of London, the more one wonders why so many writers continually bewail the existence of "miles and miles of bricks and mortar," and leave one with the impression that parks and open spaces were greatly the exception and not the rule in this huge metropolis. It would be startling if the area of all the "open spaces" in London could be presented for public consideration; and it was such a thought as this that occurred to us at our visit to Southampton Lodge, the residence of Colonel J. Wilkinson, at Fitzroy Park, N., where the summer show was located last week. Here was the beautiful and rural-like park, with Parliament Fields and ponds; while further northward lay Lord Mansfield's estate, and still within view was Hampstead Heath and the Highgate Woods—all this huge area of meadows, wood, heath, and water being part and parcel of the North London district.

Before briefly referring to the show, the grounds in which it was held may be noticed. They are typical of the many other gardens in this neighbourhood. The ground is very much undulated, and level places can hardly be seen. Everywhere there are magnificent trees, the Oak, Beech, and Elm predominating, and groups of shrubs fill up the scheme beneath.

Southampton Lodge can show some beautiful deciduous Cypresses (*Taxodium distichum*), a few Sequoia giganteas, Cedars, Mulberry trees, Negundos, and at least one handsome white Poplar, whose silvery leaves glitter in the sunshine. The cut-leaved black Birch is a tree not often seen, and one is here. There is a fine tea-arbour shaded and roofed with Vines, and so many as 200 bunches have been taken from these. Fruit trees and bushes were generally good, though American blight was somewhat too conspicuous on the Apples, and a few sprayings with Bordeaux mixture or paraffin emulsion would work a change. Triumph Melon in very tiny pits, as well as Cucumbers, and the Grape Vines, each spoke of careful treatment.

The plant houses are stocked with useful decorative plants. On the formal flower garden terrace one noted a sturdy Palm (*Chamærops—Trachycarpus—excelsa*) that has stood out many winters, and with it a *Phyllostachys* and *Negundo*. The Fern walk leads us through to the open park, lying full to the sun, and it was here that the tents were pitched for the flower show.

The exhibition was distinctly good. Mr. W. E. Boyce, who is also secretary of the Highgate Chrysanthemum Society—a distinct organisation—likewise manages the secretarial duties here, and he knows the benefit of local advertising by means of circulars and bills. Even in the centre of London we were able to choose a car that would land us almost at the gates of Fitzroy Park, and as we have had difficulties many times before to discover the locale of shows, the hint may not be lost to others who read these notes.

The groups were a fine feature, though with the space at command, it would be no tax on the competitor's supply to allow a greater area on which to arrange the plants. They should show off each subject more than can at present be done. As it was, however, the groups were very pleasing, and Mr. H. Harmsworth's gardener (J. Callingham), from North End Place, Hampstead, was first in class 1; and Mr. T. L. Turk, gardener to T. Boney, Esq., Southwood House, Highgate, formed a good second. The latter was first, and Mr. S. Hardy (gardener, E. H. Chitty) second, for the group of flowering plants without foliage subjects; but the order was reversed where the group of foliage plants were asked, Mr. Chitty having a highly creditable arrangement of Caladiums, Coleuses, *Nephrolepis*, and *Adiantums*. The single-handed gardeners' group was won by Mr. J. Adams, Hillside, Fitzroy Park; and second, Mr. E. H. Chitty.

The small Gloxinia section deserves full praise, and here the leading honours fell to E. P. Sells, Esq. (gardener, Mr. G. Drage), Bishopswood Road; second to J. S. Seller, Esq. (gardener, Mr. G. W. Earp), The Grange, Highgate; and third to Mrs. Legg (gardener, Mr. Smith), Eastwell House, Douglas Road, Canonbury. Begonias were too tall to be really good, and Mr. Drage again led.

Hardy cut flowers were poorly staged, and the selection might have been much better. This department can easily be developed, and deserves to be.

Mr. Turk's four Caladiums were excellent, and Mr. Drage's six exotic Ferns were also a good feature, as were his Coleuses, six in number.

There were dinner table decorations of a very secondary character, and the tables might have been placed end on. Sweet Peas and tall Fescue Grass were used in the three tables, the awards falling to Messrs. Turk, D. B. Crane, and Chitty, as named. Messrs. Chitty and Callingham were placed in their order for a shower bouquet, but the points must have been pretty level.

Mr. Crane was foremost for the twelve bunches of Sweet Peas, Mr. Earp and Mr. Callingham second and third respectively. In Mr. Earp's set of a dozen greenhouse bunches were the lovely and seldom seen Pentas carnea, and some nice Rose buds. Roses were not well staged, nor had they been cultivated to the exhibition standard. With really good fruits, Mr. Earp easily led against Mr. D. B. Crane for the dozen dishes of hardy sorts.

In class 12, for the best collection of garden produce, the lead was accorded Mr. W. Bignell, 5, Castle Yard, Highgate, with five kinds of fruit in the centre (being in a great round basket), twelve kinds of vegetables, Rhubarb, and Roses, and hardy flowers at the back—a really creditable display from a small town garden. Naturally, it was much praised. The same exhibitor won for a collection of vegetables. Messrs. Cutbush staged a group of plants.

### Formby, July 15th.

This show is now one of the most important in the Liverpool district. There was a superior stamp about the show, and the display of Roses and vegetables was very good. Mr. Kennedy won the four guinea, three guinea, and two guinea silver cups for twelve distinct, twelve Teas or Noisettes, and twelve in not less than six varieties; also six Teas or Noisettes. Mr. F. A. Rockliff and Rev. J. B. Richardson were seconds, with blooms of such quality as would have gained high honours elsewhere. The four guinea cup for six distinct was a tight fight, Mr. G. Lunt being victorious with splendid flowers.

For six light Roses, Mr. Luther Watts was placed first with rich flowers of Caroline Testout, Madame Cusin, and La France; and Miss M. A. Rimmer winning for darks. Each received a two guinea cup. Messrs. Luther Watts and T. Carlyle won the remaining two guinea cups, the former with handsome Mrs. Mawley and Mme. Hoste, and the latter M. Cochet and K. A. Victoria. Mr. Kennedy's five La France Roses in vase were superb. Crimson Rambler, from Rev. J. B. Richardson, was the best cluster Rose.

For growers of not less than 200 plants there were many grand flowers. Mr. T. Pugh, the secretary, won the two guinea cup with six darks; very fine were Captain Hayward, Prince Arthur, and Alfred Colomb. Mr. E. Sergeantson was a close second. Another two guinea cup for six Roses (light varieties) saw Mr. D. Lever to the fore. The N.R.S. medal blooms were Maman Cochet from Mr. T. Carlyle and Caroline Testout from Mr. W. Dodd, jun. Mr. J. H. Page took the remaining cup in this section with a pretty six.

None the less interesting was the exquisite display of Sweet Peas, six competing for the silver cup presented by Mr. H. Middlehurst. This was won outright by Mr. W. Dodd, jun., last season, and again he had the new one, with bright-coloured blooms. Mrs. Luther Watts was a very good second, and Mr. E. A. Allen third.

It was pleasing to see such a vast improvement in stove and greenhouse plants, the genial president, Mr. J. Formby, winning for single and double Zonal Pelargoniums, Maidenhair specimen, three Coleus, and three stove and greenhouse plants. Mr. F. A. Rockliff was successful with three stove and greenhouse Ferns and three capital hardy varieties; Mr. J. Aindow with Fancy Pelargoniums, Petunias, and coloured Pelargoniums and specimen Fuchsia.

Mr. E. Storey had table plants and Gloxinias, Mr. Luther Watts had beautiful Begonias, Mr. Sergeantson staged excellent Carnations. There were six table decorations, many of which were too heavy, the judges awarding the prize to Miss Jackson for a charming arrangement. An original design came from Mrs. Mathias, in the form of a plant flanked pool, arched over. A little more brightness would easily have reversed the decision, for it was superbly done. Hardy fruits and vegetables were simply grand, as was the cottagers' section. The committee contains no gardeners' names. Messrs. E. H. Bushell, the energetic treasurer, and Mr. Thos. Pugh, the secretary, with the above, working all without a hitch.—R. P. R.

TRADE EXHIBITS.—Two magnificent boxes of Mildred Grant Rose, one of Bessie Brown, a rich assortment of herbaceous plants, and grand coloured Sweet Peas were sent by Messrs. A. Dickson and Sons, Newtownards; a fine table of Lilies, Carnations, Sweet Peas, &c., from Messrs. T. Davies and Co., Wavertree; a very choice collection of Sweet Peas from Mr. H. Middlehurst; and a table of Roses and miscellaneous flowers from Messrs. Caldwell and Sons, Knutsford.

# THE BEE-KEEPER.

## Care of Comb Honey.

As so much depends upon the appearance of honey in this form, any hint towards improving it is very valuable. In some cases it enables the bee-keeper to obtain higher prices and a more rapid sale than would otherwise be possible. To procure comb honey in the best condition it should be removed from the hive as soon as capped over. It is then beautifully white, appetising, and inviting. When it is allowed to remain on the hives a longer period the cappings become darkened, and the appearance of the section is consequently injured. After removing from the hive they must have all the propolis scraped off them. This is best done by a glazier's knife, care being taken not to break the comb by roughness, or the leakage caused will soon spoil its appearance.

If it is desired to keep the honey, each section must be wrapped up carefully and neatly in paper, and then stored in a cupboard, preferably near the fireplace or somewhere where the temperature is about 90deg or above. After being in a position of this kind for some time it thickens the honey, and gives the section a fine appearance, instead of the unattractive look which it gets in a cellar or other cold places. At a low temperature water condenses on the surface of the comb, making it appear less palatable, and should it freeze it will crack the combs, and the honey will run all over the surface.

Should any sections be discoloured by travel stains, they may, by exposing them to the direct rays of sunlight, be whitened in some cases, which will improve them considerably. There are, however, different kinds of stains on sections, the most common being propolis, and the above mentioned bleaching process will with perseverance usually suffice. From one to three days exposure is, as a rule, sufficient. The use of new foundation in the body boxes also obviates travel stains to a great extent.

Of course, if the honey flow can be timed properly, and the sections placed above a very powerful colony, rapid comb building, storing, and sealing is accomplished. All these things, by assisting in the early removal of the honey, and reducing the traffic over the surface of the comb, add eventually to the beauty of the section; and, as regards minimising the use of propolis, an excess of it will be avoided if the section rack is properly fitted up, *i.e.*, all the sections fitted closely and evenly together, and then firmly wedged from the ends. This makes it almost impossible for the bees to find crevices to glue up, and saves needless trouble to the apiarist.—E. E., Sandbach.

## Honeydew.

It is many years ago since first I heard of this substance. Whilst talking to a friend on profitable rural pursuits, bee-keeping cropped up. About that time there had been a run of bad honey seasons in his locality, and this he accounted for by saying that there had been but few "honeydews" during that time. Before that conversation I had never heard of these wonderful dews, which had, for so long, proved such a blessing (?) to the bee-keeper. I smiled to myself, not believing there was such a thing in existence. Now I am convinced he did not know what the liquid was. Very shortly afterward I read a very able article on the subject in a bee journal.

WHAT IS HONEYDEW?—It is a sparkling substance made by the aphid (green fly), which in so many ways causes trouble in our gardens. When nectar is scarce the bees gather and store it. Very often it is so plentiful that it drops from the trees like a slight shower of rain. It is a cloudy, sooty-looking sticky liquid. When stored it is fairly easy to detect if the sections and frames be held between the observer and a strong light. A few summers ago I had been invited to view a gentleman's large kitchen garden. The head gardener was engaged in taking off the supers from a hive. Being asked to express an opinion on the quality of the honey, the peculiar and unusual colour attracted my attention at once. As I had never seen honeydew until then I hesitated to give an opinion. Having tasted it and noticed the sooty taste and look I was confident that this vile substance had been gathered. It is often found during a dry season when east winds have been prevalent.—HYBLA.

## Bee-keepers' Lament.

Many of our friends who neglected autumn feeding and a spring peep into the hives, have now great cause for sorrow. On every hand we hear that stocks have perished for lack of food. A few evenings ago I went among my cottager neighbours to make arrangements for the purchase of a few early swarms. Everyone of them had the same tale to tell, either "we shall require all our swarms, because we have lost so many stocks," or "we don't think we shall have any swarms, our hives are so weak."

One man, who has reached the great age of fourscore years, is still active, and takes a lively interest in bees, told me that he has never known such a disastrous season. How can we best

make good our losses? To think of profit under such conditions is entirely out of the question. Feed well for a little time with syrup made of about 1lb of white sugar to a pint of water, boiling it for a few minutes, and stir to prevent it being burnt. The bees will well repay this outlay. The other day I examined a stock of bees, and they were on the verge of starvation, for there was not more than a teaspoonful of liquid in the whole hive. The bees had given up brood raising. That same night I gave them some syrup and examined the hive in two days' time and found that the queen had laid a surprising number of eggs. If we wish to increase our stocks when the hives are fairly strong, then we must resort to artificial swarming. For the sake of those not acquainted with the art I will explain briefly:

A B C

Suppose A and B are strong stocks. Choose a bright day, when the bees are out foraging. Take some combs, say six, containing brood and eggs, from A. Brush off all the bees. Place the combs closely together in a new hive, cover up warmly, putting the new hive in the place of the strong stock B, and remove B to stand C. Thus one hive provides brood and eggs and another the bees. The bees will set to work to raise a queen. In this manner we may raise up good stocks ready for a fresh start next year.

One word of warning, and I will bring this brief note to a close. Many will advise you to add some hurtful ingredient to the syrup which is believed to cure foul brood and prevent it, but the man has yet to be found who knows of a case where it has had the desired effect.—HYBLA.

## Hardy Fruit Garden.

YOUNG FRUIT TREES.—Trees in the open and against walls, planted in autumn or spring, should now be making good progress, and most probably will require attention in watering, mulching, stopping shoots, training and regulating. When the trees are growing in dry positions, and there follows a period of protracted dry weather, which is often the case about this time, the trees may suffer. It is also possible for them to feel the effects of dryness even during a showery time, when the soil is so light and dry that moisture quickly drains away. An experienced cultivator will quickly notice the growth, judging from that whether the progress made is satisfactory or not. A strong and rampant growth is not so desirable as shoots produced of medium strength, as by the latter it will be seen roots are being formed of a fibrous character, hence sufficient moisture has been found up to this point. To preserve it still longer the trees should have a mulch of manure. In applying water give a copious supply so as to reach below the roots, but do not give liquid manure to young trees that are only making wood, unless the growth should be of a weak and unsatisfactory character, when a stimulant might improve it. When the soil has been thoroughly moistened, spread over it as far as the roots extend a layer of manure, which will act as a conservator of moisture, and render further waterings less, if not wholly, unnecessary. Having given adequate attention to the roots, examine growth, and endeavour to equalise it for the benefit of the trees. In bushes and standards weakly growths may be removed and overgrown shoots shortened back. Trained trees on walls must be treated according to the manner of their growth, training out in a free manner all those which produce fruit on current year wood, while specimens of restricted form must have the side shoots duly stopped, leaving several good leaves at the base, which induce the formation of fruit buds. Regulate and space out main shoots or branches, so that the secondary and minor growths may have ample room for proper development. In addition, insects must be kept down by occasional vigorous syringing, applying insecticides to suppress severe attacks.

SUMMER PRUNING ESTABLISHED APPLES AND PEARS.—Large espalier, bush, and other restricted trees have now sufficiently completed their summer growth of shoots as to permit of the annual shortening back of the foreright shoots of wall trees, and the side growths of trees and bushes in the open. Too early shortening may result in the vigorous growth of fresh wood, and the probable starting of the eyes at the base, it being desirable that these remain dormant, or rather plump up, but not burst into growth, which will destroy their chance of becoming fruit buds. The shortening of the summer shoots may be carried out at the fourth to sixth leaf. The weaker growths may

have the latter number of leaves left. Some thinning out may also be done, taking the opportunity to dispense with weakly spray growing towards the interior, or crowded shoots pushing in any direction.

**PREPARING GROUND FOR STRAWBERRIES.**—The season for planting, especially early prepared plants, will soon be upon us, hence it is very essential that the ground should be in readiness for inserting the plants without undue delay. Some growers wisely decide in the spring previous where the quarter of early Strawberries shall be established, liberally manuring and deeply digging the position at that time, growing thereon a crop such as Potatoes, which can be removed in time to plant Strawberries. This is a good method, as the ground becomes ameliorated and improved by the culture afforded, during the occupancy of the soil by the summer crop. But little labour is attached to preparing the soil for planting. It suffices to fork over the surface and break down lumps, removing weeds and Potato haulm. If such ground is not available, liberal preparation must be given a suitable plot. The soil must be moved deeply, and the best manner of doing so is by bastard trenching—that is, digging the soil two spits deep, but not changing the position of the spits. At the same time incorporate a fair dressing of well-rotted manure. This ought to be done as early as possible now in order to give time for the ground to become consolidated. Very light, sandy soil must be trodden firmly when in a moderately dry state.

**TREATMENT OF STRAWBERRY BEDS AFTER FRUITING.**—Immediately fruit has all been gathered from the beds the nets used for protecting the fruit must be cleared off. The next step should be to cut out superfluous runners. If more are wanted to root for stock they will all be superfluous, but in the event of a number being required for this purpose, a selection of the best must be made, and the rest cleared away. Those retained may be pegged down on a layer of fresh soil, and kept well watered. Layering in pots or on square pieces of turf may be done if this is more convenient. The strongest runners ought in all cases to be selected for layering, cutting off all growth beyond.—EAST KENT.

### Fruit Forcing.

**PEACHES AND NECTARINES: EARLY FORCED TREES.**—Trees in pots of the very early varieties, such as Amsden June, Alexander, Waterloo, Early Beatrice, and Early Louise Peaches; Cardinal, Précoce de Croncels, Early Rivers, and Rivers' Orange Nectarines, may be placed outdoors as soon as the wood has become firm, assigning them a sheltered, sunny situation, standing the pots on a bed of rough ashes, and covering the pots up to the rims with sifted ashes, keeping duly syringed and supplied with water. They will then not be liable to over-maturity of wood and buds, and blossom buds will form on the laterals, which usually set freely. Planted-out trees started at or before the new year have been cleared of fruit, and the wood on which it was borne removed. This, and the taking out of any superfluous shoots, admit light and air, so that the wood retained becomes brown and hard, and the buds attain perfect formation, but this is contingent upon clean foliage and proper supplies of nourishment. The trees, therefore, must be syringed, and, if necessary, have an approved insecticide promptly applied, supplying water, and in case of weakly trees liquid manure, to the roots, so as to keep the soil beautifully moist. Mulching with light, rather lumpy manure a couple of inches thick, will keep the surface moist, the roots active, prevent the soil cracking, and assist in the retention of the foliage in health. The buds will be sufficiently advanced, and the wood matured, to allow the roof lights to be removed, and this should not be further delayed. This secures a sort of rest, has a most beneficial effect on the trees, while the soil becomes well moistened by the autumn rains.

**SUCCESSION HOUSES.**—The grand midseason varieties Dymond, Royal George, Grosse Mignonne, Noblesse, Bellegarde, and Goshawk Peaches; Lord Napier, Stanwick Elrue, Humboldt, and Pineapple Nectarines, are now ripening on trees started in February, and leave very little to be desired in size, form, colour, and quality. As the fruit is cleared off the trees cut out the wood that has borne it, thinning the growths where they are so close that the foliage cannot have due exposure to light and air. Cleanse the growths of dust, red spider, and other insects, by means of the syringe or engine with water, using an insecticide if necessary. Keep the borders moist, not soddened, affording liquid manure if the trees are weak, have borne heavily, and the buds are not developing well, but keep it from those inclined to over-luxuriance. Stop all laterals to one joint, but where the buds are in an advanced condition allow a little lateral extension, which prevents the premature ripening of the foliage by continuing the root action, with, at the same time, growth on which to expand it, without danger of starting the principal buds. When the buds are well formed, the fruit having been cleared off the trees, remove the roof lights. If under fixed roofs ventilate to the fullest possible extent.

**TREES SWELLING THEIR CROPS.**—The trees started in March have stoned, and are taking the last swelling. Draw the

leaves aside and raise the fruit by means of laths, with the apex to the light. Water the inside border, and outside if inclined to dryness, affording liquid manure and a mulch of lumpy manure. Avoid a close surface, for it excludes air; to be open is essential for the assimilation of food for taking up by the roots, as its elaboration by healthy foliage. Ventilate early; in fact, leave a little air on all night, syringing and damping by 7 a.m. and through the early part of the day ventilate freely. When the sun loses power in the afternoon reduce the ventilation, and raise the temperature to 85deg to 90deg, about 4 p.m., with a good syringing and damping of surfaces, but it must be done with judgment, for when water hangs for any length of time on the fruit during the last swelling it is apt to damage the skin, causing it to crack, and imparting a musty flavour. Therefore, have the fruit dry before night, and if the day is dull, omit the morning syringing. Directly the fruit commences to soften or ripen cease syringing, but afford air moisture by damping the paths, and especially the border, whenever it becomes dry, ventilating rather freely, and admit a bit of air throughout the night.

**LATE HOUSES.**—If it is desired to accelerate the ripening ventilate rather freely in the early part of the day, and up to the early part of the afternoon, then keep the heat obtained by reducing the ventilation, so as to secure 80deg to 85deg, and at about 4 p.m. close, syringe well, and no harm will come if the temperature rise to 90deg or 95deg, ventilating a little at the apex about 6 o'clock so as to let the pent-up moisture escape and the temperature gradually cool down. Regulate and tie down the shoots as they advance, allowing no more than are necessary for next year's fruiting or for furnishing the trees. Let all have space for development, keeping laterals stopped to one leaf, and retain growths to attract the sap to the fruit. Any gross shoots pushing laterals from the leaf buds may be cut back to where the buds remain intact, or, if likely to disarrange the equilibrium of the trees, cut them out altogether. They only tend to promote gumming, imperfect setting, and certain casting of the fruit in stoning. Draw the leaves aside from the fruits, which raise from the under side of the trellis, and expose to the sun. If the fruit is to be retarded ventilate freely day and night, but not, as a rule, have recourse to shading, though a slight shade obtained by drawing herring nets over the roof lights is beneficial than otherwise where the panes of glass are large. Observe the conditions laid down in the preceding paragraph after the fruit commences ripening, also as to assisting the swelling.

**WALL CASES.**—Secure the growths to the trellis as they advance, being careful to allow space in the trees for the swelling of the shoots, neglect of this being often a precursor of gumming. Keep the growths thin to allow of the foliage having full exposure to light and air and for development. Syringe about 7 a.m., the house having a little ventilation instantly, increasing temperature to 75deg, or if it is desired to accelerate the ripening maintain a temperature of 80deg to 85deg during the day, but always with ventilation, and close sufficiently early to maintain that temperature, but not to raise it above 90deg. Syringe again about 5 p.m. Red spider will not make much headway, provided the syringing is thorough, and the trees are well supplied with water at the roots. Afford liquid manure to weakly trees, especially those heavily cropped. Thin finally directly the fruit is stoned. Neglect of early thinning results in thin-fleshed, flavourless fruits, and they sometimes ripen prematurely.—ST. ALBANS.

Rather dull weather, with some thunder showers towards the end of the week.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**CUTTING DOWN JACARANDA MIMOSÆFOLIA (W. M.G.).**—We should take cuttings of the plant now—the tops of the shoots—and try and strike them. They should be a little firm, and inserted in sand over sandy peat made firm, in pots over which bellglasses can be placed, or in a close case in a warm house or pit. We should not cut the plant closely down now, but only shorten the growths, keep the soil rather dry through the winter, and prune lower in early spring. Healthy plants are very beautiful in a small state—charming for table decoration and vases.

**BOOKS (A. W. H.).**—Dr. Hogg's "Fruit Manual" is out of print, and can only be obtained second-hand. "The Garden Manual" is published from the office of this journal. A new edition of Thompson's "Gardeners' Assistant" has been issued in eight volumes by Messrs. Blackie and Sons, and the price is 6s. per volume. You should apply to the firm, who are well-known both in London and Glasgow. Messrs. J. Veitch and Sons, Limited, the Royal Exotic Nurseries, King's Road, Chelsea, London, publish Veitch's "Manual of Coniferæ," and to them you should apply.

**EUCALYPTUS (M. S.).**—The Eucalyptus would be best cut down, but it is late for the operation. It would have been best to have cut it down in spring, and have kept the roots rather dry until it had pushed afresh, when water could have been given more freely. It will be best to defer the operation now until next year. It does not require a large quantity of water, only giving it when the soil becomes dry, but before the leaves flag, and then a thorough supply, repeating when occasion requires. It would be preferable to raise young plants from seeds sown next March in a hotbed, which if well grown make good plants the same season.

**PROPORTIONS OF POTASSIUM PERMANGANATE AND WATER TO USE FOR SPRAYING CARNATIONS (J. S.).**—If you use the crystals, 1oz to 3gals of water, this gives a deep rose coloured solution of the potassium permanganate. If you employ a saturated solution of the potassium permanganate, or Condy's red fluid, a tablespoonful to a quart of water. Either or both may be used for sponging, spraying, or syringing. The only drawback to its use is that of staining woodwork, &c., otherwise a good fungicide, and first employed successfully against the Hollyhock disease; the green fluid (manganate), a tablespoonful to a quart of water, being used by means of a sponge for arresting that malady.

**STRAWBERRIES PRODUCING SMALL FRUIT (H. E. M.).**—The plants of Royal Sovereign and Sir Joseph Paxton around which you sprinkled kainit in April, and that have produced small fruit, not larger than a Barcelona nut, would certainly be prejudiced by the kainit, as it was applied too late, and needs supplementing with nitrogenous matter, such as nitrate of soda. Apart from this, plants four years old cannot be expected to produce large fruit, therefore the best plan would be to procure the earliest and sturdiest runners from the fruitful plants, even if producing small fruit, and make an entirely new plantation so far as they are concerned, and probably also the three-year-old plants. The one and two-year-old plants we should certainly retain, as they will recover from the effects of the kainit, and no doubt afford good produce next year.

**BRUGMANSIAS LOSING THEIR LOWER LEAVES (Cambridge).**—This is to some extent natural; but these plants are very much subject to red spider, and it is possible that your plants are suffering from that cause. They should be well syringed twice daily should such be the case. It is more likely that the plants at some time have been too dry than that they have been too moist. Standing in a rather shady position would be beneficial rather than otherwise. Give them a top-dressing of loam and manure in equal parts, and when roots appear on the surface give occasional waterings with weak liquid manure. Syringe daily and they may flower tolerably well during the autumn. Postpone shaking them out till the end of the year, when they should be repotted in equal parts of turfy loam and peat and well-decayed manure; but red spider is the chief difficulty with these plants, and must be guarded against.

**BRICKS (G. A.).**—The price of bricks for building purposes averages 25s. to 27s. per thousand.

**BOOKS ("Learner").**—"Landscape Gardening," by Waugh, price 2s. 8d., may assist you. Morgan and Co., 8, St. Mary-at-Hill, London, will obtain it for you.

**GRAPES SPOTTED (Grapes Onwards).**—The berries, evidently those of Lady Downe's Vine, are affected by what is known as scalding, which generally occurs when the berries are about half grown and after stoning, before taking the final swelling for ripening. Sometimes it is but a few berries here and there which are affected, but frequently the entire side or whole of the bunch is damaged. This is caused through late or imperfect ventilation on some bright, sunny morning whilst the internal atmosphere, and even the berries, are saturated with moisture. The preventive is a gentle warmth in the hot-water pipes and a little ventilation constantly, increased from the early part of the day and free under favourable external conditions for about a fortnight or three weeks in advance of colouring and continued until this is well pronounced; then danger from scalding is usually past. The berries are also, or some of them, affected with "spot," which first appears as a whitish mark on the side, usually upper, of the berry, as if it had been bruised in some way. The pulp dries up beneath the skin, and a sort of contraction occurs, the berry soon assuming a one-sided irregular form. This is due to a parasitic fungus, *Gleospodium ampelophagum* (syn. *laticolor*), for which the best preventive is dressing the rods or Vines after pruning with a 10 per cent. solution of sulphate of iron always before the leaves expand, burning all affected berries so far as possible. Some of the berries are shanked, this being no doubt due to a bad condition of the soil composing the border, for which the best course to pursue is careful lifting of the Vines and replanting in good, sound, open material over good drainage, thus having superfluous water carried off by drains having proper fall and outlet.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. F.).—1, *Cistus lusitanicus*; 2, *Abies Webbiana* pindrow. (Creeper).—We had overlooked the plant; it is *Vitis inconstans*—synonym *Ampelopsis tricuspidata*. (N.B.).—1, *Lycnis coronaria alba*; 2, *Sedum album*; 3, *Santolina incana*; 4, *Centaurea ruthenica*; 5, *Anemone narcissiflora*, flowering late.

## The Omniscient and Courteous Editor.

In the course of a week we manage to devour a good many papers, daily and weekly, of all shades of opinion, and touching on many subjects. One column is of immense interest to us, and that is "Answers to Correspondents." It is perfectly amazing to us the amount of information given and received in that column. We will keep, for the present, to the agricultural organs as they most vitally concern us.

In the first instance we should much like to know something of the age and status of the anxious inquirers after knowledge. Sometimes, nay, often, we are tempted to wonder whether they are all bonâ fide inquiries, and yet we think they must be, as the ingenuity of one man could never devise such a series of brain-racking problems. They are a confiding set these good folks; they apparently think the editor can solve any doubt and difficulty, and they show him no mercy.

It is said of Anthony Trollope that he considered that novelists should subscribe to keep a lawyer, whose sole business it should be to see that no writer belonging to the co-operation should in his books advocate or propound bad law; in fact, we might go one better and suggest a doctor on the same lines, who would see that hero or heroine died of no impossible disorder. But the editor of an agricultural newspaper must either be himself an Admirable Crichton, or he must employ a sound lawyer, a first-rate vet., an analytical chemist, and a general farm adviser for the benefit of his readers, who expect to get safe opinions free, at least for the outlay of a penny for the paper. (We hope their subscriptions are paid up.)

The people who write are invariably in difficulties with their landlords, and as their questions read, they appear always as the aggrieved party. There is an old proverb about one tale being good till the other is heard. It seems an astounding thing to us that all these landlords should figure as harpies. Surely when a man takes a small holding he should know on what terms it is taken. Surely there is an agreement of some sort drawn up on paper that he reads and ought to understand. As to tenant right, values, and other matters of that kind, the custom of the country is, perhaps, the safest guide, or there must be local valuers and auctioneers who could impart the desired information. A man is always a bit biased in his own favour, and it requires a very impartial, level-minded man to state his own case, and at the same time to be fair to his opponent. There are constant differences with neighbours about fences, watercourses, trespassing animals, disputed sales, overhanging trees, and a host of other things, that a veritable Daniel would feel uneasy to undertake. The law of servant and master has frequently to be explained, and we fancy the servant is often the master's master.

A new set of questions is cropping up of late, questions respecting employer's liability in case of accident. We will give a bit of advice here. Insure all your servants, big and little, and thus make yourself and them secure for the future. But it is, perhaps, in regard to the ailments of stock that the most numerous questions arise. From pigeons, through fowls, by way of the pigsty, the cow-house, the Shire and Hackney stables, the queries absolutely pour in.

We have seen, and we could not possibly think it a case of undesigned coincidence. A query most decidedly from the same man appears in three different papers in the same week. Now, does he suppose that in the multitude of counsellors there is wisdom? or does he prefer this cheap way of getting advice to paying a qualified vet. from making an examination on the spot? In many cases the questions asked relate to cases that should be dealt with at once. We all know that to facilitate the publishing of a weekly paper the matter must be in type (save that space reserved for late news) some day or two before publication. All this valuable time is being lost.

In the case of animals the progress of disease is often or more generally rapid, and in nine cases out of ten the advice must come too late. Who can these people be who thus put off and dally with mortal illness? Either those who are very ignorant or very miserly. A case came under our notice only last week, when a query was addressed to the editor on a dirty bit of paper, written in faint pencil, respecting some stock that was seriously amiss, and asking for his approval for the administration (in a barbarous manner) of some old wife's nostrum. The question that arose in our mind was, "Would the man proceed with his own remedy, and cause certain agony, if not death? or would the wretched creatures meet their death through the disease taking its normal course? We might add that this particular paper, or rather the editor, is ready to answer urgent inquiries by return of post if a very trifling fee be enclosed. We rather wonder that this system is not more fully carried out, but we think at any rate the fee should bear some proportion to the labour entailed, and when queries come written in pencil that fee should be doubled.

There is another thing that strikes us. There are certain, what we might term, standard ailments, such as scour in calves, abortion in cows, milk fever, and several others equally common. We dare undertake that not a week passes but these cases are cited and remedies asked. This implies gross carelessness and inattention. In the case of a new and infectious disease we could well understand a desire for information, but for ordinary everyday ailments we should be much inclined to refer "Anxious Inquirer" to vol. 00, No. 00, page 00, and see that he did not get a copy without adequate stamps. These are people who never stop to consider how little trouble, not how much they can give to the long suffering editor.

Then again, so many apparently think that the most vague description of ailment in most untechnical terms, is all that is needed to describe an obscure disease. The age and sex of the patient is often left unmentioned, the manner of feeding, housing, and general surrounding is left to the imagination, and they will often ask for a prescription for an animal after two, if not more vets., have declared the case "incurable."

The simple faith that prompts the unsuccessful farmer to ask the editor for a scheme of management by which he may obtain a comfortable competence would be amusing but for the tragic side. Here is another case:—A widow lady of sixty, suddenly deprived of the greater part of a good income, has an idea that she may recoup herself by poultry breeding, and thus be enabled to live in her accustomed style. The kindest thing is to answer decidedly in the negative, but she expects to have the why and the wherefore carefully considered.

As to the questions on dairy management they seem to us utterly superfluous, as such excellent manuals can be purchased for a few pence that reveal every secret and mystery connected with this art. People want royal roads to everything and everywhere, and there is but one royal road—diligent and intelligent application. With respect also to dairy difficulties, if they are very acute why do not the searchers after truth attend a course of dairy classes? Schools and teachers are pretty well scattered broadcast over the United Kingdom, and a good thing should always be worth a little trouble in attainment.

There are earnest people who regard the death of fowls as a great calamity, and are more inclined to search for remote causes than to put down the mortality to the ordinary course of Nature. As for a post-mortem, we can conduct that ourselves. It does not take great discrimination to discover a diseased liver, or super-abundant fat, or a distended crop. Liver disease can be set down as preventible. As in the human race, too rich food is accountable for that, but the owners, not the fowls, are to blame. They, poor things, eat what is set before them or they would starve. Let them follow their own inclinations and have a free run, and they will take care to get plenty of green food to counteract the too heavy diet. There again, as in dairy work, practical manuals are to be found, both good and cheap, and easy of comprehension. Sixpence will go a long way in providing adequate knowledge, and a book on the shelf is better than an editor in London.

We do not want these notes to discourage anyone in the reading of the many good papers that are published; indeed, we would wish them to be studied more closely and read more attentively. There is always something to be found of value, of interest, and of amusement. Some of the best writers of the day contributing. All we ask is that they may have more appreciative readers.

### Work on the Home Farm.

The rain which we desired in the interests of all the root crops has been forthcoming, and already a great difference is manifest. Potatoes are covering in and will be difficult to spray, but with the moist weather conditions we have at present it is most essential that the spraying should be done. Turnips under the influence of humid warmth are romping away, and with their annual weeds require every possible attention. A day or two ago we heard two farmers discussing the value of hoeing an acre of common Turnips. One farmer was giving 5s. per acre with a strict stipulation for the work being thoroughly done. The other was getting his Turnips hoed for 4s. 3d., and he said that the work was being done as well as he desired. As he is very thoroughgoing it has probably been done well, and he has saved 9d. per acre in comparison with his friend from the next parish. Labourers are always ready to take a special price for doing fancy work, but the work does seldom much excel the ordinary, and we fancy that the farmer who lets his work on ordinary terms and looks closely after the men is the most practical.

The Clover and hay stacks having had time to settle must soon be thatched, and the thrashing of Wheat and batting of the straw for thatching purposes after harvest must be proceeded with. Machines have been heard humming in several directions lately, and there are grave reports as to damage done by mice. One farmer declares he will never again keep Wheat long into the new year, but probably he has made the same vow before. It certainly is a losing game unless the mice are poisoned, which may easily be done. There is generally an expert at the business in every neighbourhood.

Hedgerows are growing well under the influence of the rain, and will soon be ready for the annual trimming, which we do before harvest if possible. There may be no opportunity this year.

There is a little more inquiry in the wool trade, and several clips are being bought up. It is rather difficult to ascertain exact values, but 15s. per 28lb, half hog and half ewe will not be far from the mark.

We are about to lay in the annual supply of coal. House coal is the same price as last year. Steam coal is 6d. cheaper. Has the coal tax any effect on home prices, we wonder?

## CLIBRANS ROMAN HYACINTHS

Pure White; deliciously fragrant.

We handle hundreds of thousands of these bulbs annually; that they give satisfaction is evident by the following:—

"HARROGATE, June 3rd, 1903.

"Bulbs supplied by you, especially the Roman Hyacinths, turned out excellent, and were much admired by visitors to the hotel."

"CO. LIMERICK, May, 1903.

"Having grown for several seasons a good quantity of early white Roman Hyacinths supplied by you, I feel it my duty to say I always found them of first-rate quality. I have often counted as many as five and six spikes on a single bulb."

"LEEDS, June 4th, 1903.

"The Roman Hyacinths supplied the last two years have been very fine indeed. They were admired by everyone who saw them."

"WARKWORTH, May 25th, 1903.

"The Roman Hyacinths supplied by you last year were entirely satisfactory, as I have invariably found them to be."

Prices on Application.

Trade, send for Wholesale List. Special Retail Catalogue, free.—**J. E. SMITH.**

## Journal of Horticulture.

THURSDAY, JULY 30, 1903.

## Soil Nitrogen.

THE element nitrogen so absolutely essential for plant growth occurs in the soil under several different conditions, and is derived from many sources. The air of the soil is impregnated with free nitrogen, and in this state it is of especial importance to the life of certain micro-organisms, which seize upon it as food for themselves, and in the course of their work transform it into an available form for the nourishment of higher plants.

In the first instance, nitrogen exists in the soil as ammonia gas, but this rapidly passes into the nitrous forms through the agency of the microbes. In fact, it has been found in the Rothamsted experiments, where large quantities of sulphate ammonia have been applied as manure, that in three days nearly every trace of ammonia has disappeared, all of it having been converted into nitric nitrogen, in which form most of the higher plants derive their nitrogenous food.

By far the larger part of the nitrogen of soils is, however, stored up in the material known as humus. This humus matter through the processes of decomposition and of nitrification is gradually made available to plants by the action of bacteria; this is Nature's way of providing food for new vegetable life from the debris of preceding life. Thus the decaying roots of growing crops and of vegetable debris incorporated into the soil as manure contribute in no small degree to the stores of organic humus matters in a soil, and as this becomes soluble it greatly assists in soil fertility.

### SOURCES OF SOIL NITROGEN.

In the greater number of ordinary soils the proportion of both carbon (humus matter) and of nitrogen become less and less as we penetrate below the surface soil, which shows

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "**THE EDITOR**," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

"Kings." The whole of the chapter from which the above is extracted contains much curious and not unhelpful remarks, and so also in that on "General Rules on Gardening," as, for instance, "Set moist, and sow dry." "Seeding spoiles the moste rootes." "Thin setting and sowing is profitable," &c.

But it is time to turn to fruit trees, which beyond everything attracted most the mind of Lawson. The sorts he best liked were Apples, Pears, Cherries, Wardens, Filberds, red and white Plums, Damsons, and Bullace. "We meddle not with Apricockes nor Peaches, nor scarcely with Quinches, which will not like in our cold parts"; and, in another part of his book, he pool-pools the idea of growing Peaches trained to walls as being altogether antagonistic to Nature, and therefore certain to fail.

Amongst smaller fruits mentioned are Barberries, Feaberries (or Gooseberries or Grosers), Raspberries, Strawberries, which were planted about the roots of tall growing fruit trees and Currants. Some of the cultural propositions enunciated are no doubt provocative of a smile when read in the clearer light of to-day; but in the matter of pruning and training we are not one whit in advance of Lawson. He accorded the branches of his trees plenty of space, and instead of permitting the stems to grow beyond reach, he pruned and trained trees while still young, and thus kept them within bounds, and, so far as we can judge, from a specimen engraved from a drawing of the author, they were, indeed, a roughly grown form of bush, well open in the centre. Then he condemned the practice of uncovering the main roots of fruit trees during the winter months, and he shows that, while it hurts the roots, it did nothing whatever towards effecting the purpose on account of which it was pursued, namely, to retard the expansion of blossom, and so escape spring frost.

In this he was very far in advance of his age, because the practice of ablaquation, as it was called, continued in vogue till well into the eighteenth century. All the same, remarks of Lawson punctuate not only the position he himself had attained as an intelligent pomologist, but also serve to indicate no slight amount of interest in fruit culture generally at the time he lived.

But as the space planted in gardens and orchards was always limited—Bacon's princely gardens, it will be remembered, extended to only thirty acres—Lawson planted only the more valuable kinds, such as Cherries, Damsons, and Filberds, being relegated to the fencing, which formed in those days an indispensable complement to gardens. It may be noted that on account of the animals, such as deer, goats, sheep, hares, conies, cattle, and horses, all of which appear to have roamed at will about the country, a fence with its addition was a formidable affair. Lawson describes one with an outer and an inner ditch 4ft. in depth, between which was a broad space for a fair walk. The sides of this mound were planted with Thorn and Honeysuckle, and various trees, including the fruits already noted. Another form of fence in common use was a "dry wall of earth." Our author's sympathies tended in this direction because Wallflowers grew naturally thereon, and afforded with "Palms" an early feed for his bees. Earthen walls were, indeed, almost an English institution as a garden fence. Turner, for instance, observes that *Hordeum murinum* was called Wall Barley because it commonly grew on fences of this kind, and 200 years later Mr. Lawrence, when he commenced gardening, had to remove an earthen wall and replace it with one of brick.

Stone, wood, and brick were also in use for fencing in Lawson's day, but the impression one receives is that they were not common. I have incidentally mentioned bees which formed at this period an unfailing item in the gardener's daily work, and Lawson mentions a method of protecting hives in recesses in stone walls as a novelty in his experience, which derives not a little interest from the fact that in the old gardens attached to Edzell, in Forfarshire, exactly the same recesses remain till the present day in one of the garden walls.

The general reader may have concluded that Lawson was himself merely a gardener, but while it is clear that he was perfectly cognisant of methods and means, and qualified to not only direct but to undertake much of the operative work in a garden, it is at the same time inadmissible to accept that theory. Lawson employed a gardener, and, moreover, explains that his book was written not so much for people who kept a gardener as for those who had to trust to labourers, and who not improbably would welcome his book as a help in directing their work. Besides, I am unaware of any other source where it is possible to gain so definite a pronouncement on the gardener of that period as that given by Lawson.

It is needless to copy the lengthened list of good qualities the head gardener of 300 years ago was expected to possess, but it may be noted that "hee must not be a scholast to make shew." He concludes "you must needs allow him good helpe to end his labours which are endless, for no one man is sufficient for these things," and elsewhere it is remarked, "Your under gardners must labour to keepe all cleanly and handsome." Here we have unimpeachable evidence of country gardens in England being managed by men not devoid of education, and assisted by a staff of under gardeners who admittedly performed work of the same nature they do to-day.

The exigencies of space have caused the omission of not a few interesting and instructive passages—e.g., the subject of soils,

cultivation, stocks, grafting, and gathering of fruit, and the management of forest trees, on which Lawson held very pronounced opinions, and apparently in advance of those entertained by his countrymen. But possibly sufficient has been noted to indicate the broad lines on which gardening progressed in the north. Of course it is at once palpable to the student of Lawson that, along with the practical advice he places at the service of his reader, he was at the same time an idealist. As there was no existing garden from which Bacon described his, extraordinary in so many points; so, while keeping mainly in view the demands and tastes of his time, Lawson also to some extent produces an idealised garden. It would not be so delightful if it were not so. The garden was still a part of the house, and our author, with his description of Woodbines trailing over the doorway, the seemingly and comfortable seats of Daisies and Violets, the maze into which his friend, wandering in search of berries, fails to recover himself without help, the mount from which he angles a "peckled trout or sleightie eele"; this garden, in a word, which "makes all our senses swimme in pleasure," is just what we all are attempting to produce, and always coming short of the accomplishment.—B.

## Hybrid Perennial Phloxes.

Perennial Phloxes were introduced into European horticulture about 1780, since which time they have been considered as plants of especial merit. When cultivated in pots, they render good service in the ornamentation of apartments, balconies, and corridors. Flowering occurs, according to variety, from the middle of July, even to September.

The principal varieties are: (1) *Phlox pyramidalis* or *maculata*, a native of North America, its stem attaining a height of from 3ft. 3in. to 3ft. 6in., with odoriferous flowers arranged in serrated panicles; (2) *Phlox paniculata*, with straight, brittle stems, from about 1ft. to 3ft. high, having reversed leaves, at the end of which there is a superb panicle cluster, which is pyramidal and serrated with pedunculate, odoriferous flowers; (3) *Phlox acuminata*, better known under the name of *Phlox decussata*, with lanceolate leaves and stems from 30in. to 40in. high, which are straight, and terminated by a round cluster of flowers of a rose-lilac hue. This is a very simple plant, and can be grown in most indifferent soil, having also the advantage of withstanding drought. It is undoubtedly owing to these qualities that seedsmen and amateurs have applied themselves to the improving of this plant. Numerous varieties of the hybrid perennial Phlox are now comprised under the name of *Phlox decussata*.

All the beautiful varieties obtained from seeds come from the crossing of the *Phlox paniculata*, *pyramidalis*, and *decussata*. In point of fact, it is from the latter that, as a result of the persevering and intelligent selections that have been made, the most remarkable varieties have been obtained with hues varying from the purest white to the darkest red.

The cultivation of the hybrid perennial Phlox is very simple, for these plants will grow in all soils, irrespective of the situation. It should be mentioned, however, that they grow best in good soil, and in a place where they are favoured with the sun. They can be multiplied by seed, division of the crowns, or by cuttings.

**SEED.**—Seed plots of perennial Phloxes can be made all the year, though, preferably, as soon as the seeds are ripe in October. Furnish a well-drained bed. The raising of the seeds is very slow and risky, sometimes even only springing up the second year, especially if sown in the spring. When the plants have a few leaves they are transplanted 6in. apart. As a rule, seed plots are only used by specialists endeavouring to obtain some new varieties, for the various methods of multiplication are far simpler and quicker.

Division of the crowns is best done in the spring. Perennial Phloxes can also be multiplied by bedding the branches in the soil in August or September, and, if well watered, these branches will soon take root at all the nodes which are buried.

Cuttings are useful where a large number of subjects of the same variety are desired. They may be taken during the whole year, though it will be easier to operate with young shoots, inserting them in a light and sandy soil, covered with a bellglass or in a frame. Once having taken root, they are planted in the nursery until the time arrives for putting them in their respective places.

*Phlox subulata* or *frondosa* are ornamental for rockeries. *Phlox setacea* was introduced from North America in 1786, along with the *Phlox Nelsoni* and *nivalis*. *P. reptans*, also introduced from North America in 1800, is cultivated under the names *verna* and *stolonifera*. This is a very different plant on account of its rounded leaves, which are thick and silky; as likewise by its purple-red cyme inflorescence and its uncovered and viscous flowers. These different species of Phlox make delightful border plants from the end of April to May, and even June. They can, moreover, be easily multiplied by dividing the clusters.

Cattleya × Oweniana.

It was in 1892 that this very beautiful flower received a first-class certificate, and like so many other of the choicer hybrids, the stock of plants has increased very slowly. The lip has a rich velvety crimson apex, and in form it narrows at the throat, which is deeply veined with gold, as are the side lobes. The sepals and petals are white. Though the parentage was not recorded at the time when the award was made, it was suggested that *C. gigas* and *C. aurea* were the progenitors.

#### The Week's Cultural Notes.

We have few more thirsty subjects than *Odontoglossum citrosmum* when growing freely and well established. The roots appear able to deal with very large supplies of water, and unless they get it the pseudo-bulbs will not swell up to their full size, consequently the flower spikes will be weak. *O. grande*, too, and its allies *O. Insleayi* and *Schlieperianum* can do with full supplies now, as both growth and flower spikes are forming. Just now there is something exceptionally attractive to insects about these last named species, and unless the greatest care is exercised, both flowers and growth will be ruined. Standing the plants in saucers of water on other pots inverted is a good protection in the case of slugs.

In the cool Orchid frame a little soot and lime should be sprinkled over the ashes, or shingle that is used for standing the plants upon, the ammonia rising from this being of great benefit to the plants, and distasteful to slugs and other insects. A little air must be left on top of the frame all night, the only time for entirely closing it being late in the afternoon. Even then air will be admitted below if the frame is, as it should be, propped up by bricks at each corner.

In some cases *Oncidium macranthum* and other of this set will be producing roots from the base of the growths, high up out of the compost, and in order to save these from insect attacks, and allow them the benefit of the compost, a little moss and peat should be placed near them, to conduct the roots, so to speak, to their proper place in the pots. These, too, require abundance of moisture now after the strain of flowering, liking it both on the leaves and roots.

*Cattleya citrina* is now at its quietest period, and should be suspended near the roof glass in the coolest house. I am not an advocate for overdrying this species at any time, but its very habit of growth shows that it dislikes much water, especially over the foliage, and now that it is practically at rest quite sufficient for its needs will be drawn from a properly moistened house. The use of the syringe is to be avoided, and only occasional moistening of the roots allowed. Cork blocks lightly dressed with moss are best for growing this species upon; it never seems happy in pots. —H. R. R.

### Propagating Pansies and Violas.

Pansies and Violas are interesting flowers because of the wide range of diversified colours they present, and the length of time, Violas especially, continue in bloom. In many bedding arrangements Violas form an excellent groundwork and also pleasing edgings to beds. Pansies should be grown in beds to themselves or be associated with spring flowering plants. They flower the best in the months of April and May, after which time the plants may be removed for summer bedding.

Violas continue to flower longer and are more or less attractive throughout the summer, if the soil can be kept moist and cool, and due attention is given to removing spent blooms. A mulch of rotted manure is beneficial, as it prevents moisture from the soil evaporating, and will supply some sustenance to the roots when it is occasionally copiously watered.

The present is a suitable time to consider the best means of raising a fresh stock of plants to insert in autumn for spring flowering. It is possible to do this by both seed and cuttings. The former plan must be resorted to where no plants are available to obtain cuttings. Fortunately it is a most interesting method, and the plants obtained grow away freely, a large majority of them proving of good quality and free flowering.

The seed, which should be obtained from a reliable source, may be sown in a cold frame, or even outdoors in a shady border. Draw shallow drills 3in apart, making the soil moderately rich and fine previously. Scatter the seed thinly and cover sparingly with very fine soil. Shade to prevent evaporation, but if the surface soil dries, sprinkle on water with a fine-rose can. No thinning out should be necessary until the seedlings are large enough to prick out singly. This may be done on a finely pre-

pared border of soil composed of loam, leaf soil and decomposed manure, not using too much of the latter ingredients.

Lift the seedlings with as much root as possible, and prick out 2in apart. Having received hardy treatment the little plants are short and sturdy. Give them a gentle watering, and continue to do so when necessary. This will be all that is required until the autumn, when they are ready for lifting and planting.

In raising plants by cuttings it is important to note that the best shoots for the purpose are secured from the base of the plants. They are usually produced freely onwards from the present time. To facilitate their production in the case of Pansies it is best to cut away the old growth as soon as signs are given of diminished vigour in the flowering. The same may apply to Violas, but under moist treatment the shoots will be produced along with the flowering. Those not showing flowers are the best. Frequently they may be secured with some small white roots attached.

Thick stemmed growths with large leaves do not make good cuttings, being hollow in the centre, and though they may look so promising they eventually die off, while those of slender appearance keep fresh and soon root. The preparation of the cuttings is simple. Some will need none, while others only require the small leaflets at the base nipping off, and the stems cutting to a joint.

Those having short, white rootlets or a portion of blanched stem may be dibbled in as they are. Use a small, blunt ended stick, making the hole no larger than necessary. The surface inch of soil should be made light, fine and sandy. Prick the cuttings out 1½in apart, in rows 2in asunder. See that the base of each cutting touches the bottom of the hole. Press the soil closely round. Carefully label the colour or name of variety, and when all are inserted give a copious watering with a fine-rose can.

The best position for the cutting bed is on the shady side of a wall or in a frame which can be readily shaded. The cuttings must be kept moist by occasional sprinkling. All being well they will be sufficiently rooted for planting in beds or borders in autumn.—E. D. S.

### Certificated Plants.

(Continued from page 560, vol. xlv.)

**PASSION FLOWERS.**—The only seedlings from the hardy *P. cærulea* to receive an award from the R.H.S. is *Constance Elliott*, a pale, almost white variety, certificated in 1884. At one time there were to be seen in many of the suburbs of London fine examples of the common hardy species growing against the walls of villa residences, but the severe winters during the past twenty years destroyed most of them. Some species have received awards, but they are rarely met with in gardens. The most numerous cultivated in greenhouses and stoves are *P. edulis*, which produces large purple fruit, and *P. quadrangularis*.

**PENTSTEMONS.**—I can well remember some of the earliest improvements made with *P. Hartwegi* (*gentianoides*) in the early forties, and it had much to do with the development of the flower; so probably had *P. cobæa* and *P. glaber*. It was not until 1861 that the *Pentstemon* received recognition by the R.H.S., when *Lobbianus*, not, it is presumed a species, received a certificate of merit, followed by *Blue Beauty*, *Compactus*, *Mrs. Steans*, and *Princeps* in the following year. Thenceforth, the progress of the flower was rapid, and the energies expended by Scotch and Continental florists in its improvement have culminated in the development of large *Gloxinia*-like blossoms of great beauty; and though the fine modern improvements are of such vigorous growth, yet difficulty is experienced in keeping the plants through the winter after flowering when in the open ground; hence it is necessary as a precaution to perpetuate fine seedling varieties by means of cuttings. Awards of merit are now made to strains rather than to individuals, as the aggregate of quality is so high.

**PERNETTYAS.**—Mr. Davis, of Hillsborough, Co. Down, did great service to horticulture when in the seventies he produced his seedling *Pernettyas*. He crossed *P. mucronata* and *P. angustifolia*, and obtained robust growing varieties producing large clusters of varied coloured berries according to the variety, and between 1878 and 1882 he received as many as seven certificates of merit for varieties either with white, flesh-coloured, lilac, black, or crimson, &c., berries. They are of great value as decorative subjects in winter.

**PETUNIAS.**—Fifty years ago the *Petunia* was rapidly becoming popular as a florists' flower. It was not till 1823, when *P. nyctaginiflora* was introduced, followed by *P. violacea* in 1831, that florists had material to work upon. The two readily lent themselves to crossing, and yielded in their progeny much variation. I have a lively recollection of the interest created by such varieties as *Lady Cullum*, *Novelty*, *Major Domo*, and *Hermione*, certificated by the National Floricultural Society previous to 1858; and also of *Shrubland Rose* and *Countess of Ellesmere*, popular rose-tinted bedding varieties. It was not till 1861 that a *Petunia* received an award from the Royal Horticultural Society,

when the once popular *inimitabilis flore-pleno* won this honour for Messrs. Veitch and Sons. That was followed by *Butterfly* (Holland), Mrs. Ferguson (Ferguson), a charming variety in those days; Emma (Bull), and Eliza Mathieu (G. Smith), &c. In those days the small, finely formed, striped and self varieties found most favour. Now we have a race of large, ill-shapen, flabby varieties of Continental origin, to the exclusion of the florists' type; but there is evidence that these well-formed, stout, small-flowered varieties are coming to the front once more. The *Petunia*, formerly a popular exhibition plant, has ceased to be so. The specimens seen at our large flower shows are in the form of market grown stuff, but they are of great service in the garden in summer, their great freedom and continuity of blooms being one of their chief recommendations.

**PHILADELPHUS.**—The Floral Committee had been in existence for a quarter of a century before an award was made to a member of this genus, a species named *mexicanus* being so recognised.

mittee was to a variety named *Orion*, in 1860. Of late years several fine standard varieties, such as *Avalanche*, *Coquelicot*, *Eclairer*, *Iris*, *Lord Rayleigh*, *Torpilleur*, &c. In addition many awards have been made to varieties growing in collections at Chiswick. Most of the new varieties of recent years have come from abroad. The growth of these is generally dwarf and bushy, the individual flowers large, and the trusses of bloom bold and striking. New varieties also emanate from Scotland, especially of the *P. suffruticosa* type. The *Phlox* is, in many parts of the country, a favourite subject for exhibition.

**PHYLLOCACTI.**—Seeing that all the awards made to new varieties of this group have been made within the last twelve years, it is obvious the improvements which have been made are of comparatively recent date; or at any rate, it is during this period they were submitted for recognition. It is worthy of note that about 1870, Colonel Charleton, Farm Hill, Isle of Wight, bloomed a series of beautiful hybrids, obtained by him from cross-

*Cattleya* × *Oweniana*.

Other species, such as the scentless *Virginian inodorus*, the hybrid *Lemoinei*, and *microphyllus*, a small leaved form, were similarly recognised. The latter is one of the prettiest of the *Mock Oranges*, and is quite distinct from all other species, the pure white flowers being produced in great profusion. Of the sweet scented *coronarius* group, *Boule d'Argent* and *Mont Blanc* are very fine additions to our hardy flowering shrubs; and no garden can be said to be complete unless this group is well represented.

**PHLOX.**—Here is a genus which comprehends several types, ranging from the dwarfiest forms of *P. subulata* to the tall growing varieties of *P. suffruticosa* and *P. decussata*, and the large group of annual varieties headed by *P. Drummondii*. *P. divaricata*, shown under the name of *P. canadensis*, and *P. subulata Vivid*, obtained awards; but the great bulk of those given by the Floral Committee to new varieties went to the progeny of the herbaceous types. Mr. F. W. Burbidge informs us that "The herbaceous *Phlox* of our gardens, of which we have now so many forms, appears to have descended from *P. decussata*, *P. paniculata*, *P. suffruticosa*, *P. Carolina*, and other old species of the tall growing section." It would perhaps be difficult to define exactly upon what lines the first award made by the Floral Com-

ing *Cereus speciosissimus* and *Phyllocactus crenatus*; and in the same year the late Mr. C. M. Hovey produced a race of hybrids between the creamy white *P. crenatus* and some scarlet-flowered form. But it remained to Messrs. Veitch and Sons, of the Chelsea Nurseries, to produce the latest developments, and of the seventeen awards made to new forms which find a place in the list of certificated plants, all were for varieties shown by the Chelsea firm.

**POLYANTHUSES.**—The first form of the giant *Polyanthus* (*P. elatior*) to obtain recognition was *Golden Prince*, which was exhibited by Messrs. E. G. Henderson and Son as far back as 1868. Since then several others were similarly honoured, but the practice of giving awards to individual varieties is now practically abandoned, and any recognition is now made to strains, as they are generally very good, and much in demand for spring gardening. Of the gold-laced section a new variety rarely finds its way to the table of the R.H.S. What new ones are produced—and they appear only at intervals—are from the north of England; the cooler and moister character of which is more favourable to their well doing.—R. DEAN.

(To be continued.)

### The Carrot Crop.

Your correspondent "W. S." may enjoy what satisfaction can be extracted from my experience of the Carrot crop this year generally in learning that things with him and in his locality are no worse than they are elsewhere. We seem this year to have almost universally suffered from a Carrot epidemic, for never in the history of Carrot culture, so far as I know, have these roots looked worse, or has it been more difficult to obtain a decent plant. Here is a subject of real importance which may well merit the attention of that not too practical body, the R.H.S. Scientific Committee, for it has not been possible for growers to determine the causes which have led to this comparative Carrot failure. Just recently I heard one of our leading Middlesex gardeners say that he could not get a Carrot plant anyhow. Just recently, too, I have been examining hundreds of gardens and allotments in all parts of the favoured county of Surrey, the Carrot county par excellence, and the proportion of decent Carrot beds found is about 10 per cent. Generally the beds are of the most miserable nature; indeed, the plants have almost disappeared. One or two quite good beds may be seen in the same locality, and on precisely similar soil, where there are also twenty wretched ones. The time growing and general culture has been the same, but the results have been so dissimilar.

On all bad beds the leafage is infested with the Carrot aphid or lice, which is sucking the juices from the plants. In one little garden at Carshalton where there were a few very respectable rows, a very old man said that he saved his by making paraffin emulsion—two wineglasses of paraffin to a gallon of water—well working it through the syringe, then gently spraying the plants. Still, there was the odd fact that some good if small beds were so without having been sprayed at all. I have observed that where any of these cottagers sowed seed early in July to secure a winter pulling crop that they had an excellent clean plant. I should think, aided by these recent rains, there will be no difficulty in getting good clean beds from July sown Carrots for winter use where they were wisely sown. I have wondered whether the general failure of the Carrot sowings was in any way due to old seed. Last year was not a good seed year for many things, and if the Carrot crop was a bad one, then a good deal of old seed or imperfectly matured seed may have been sent out, and allied to the cold spring the result would naturally be imperfect or weak germination, and equally weak growth, upon which the Carrot aphid would speedily prey. Old seed may germinate well in warm soil in July, yet badly in March or April when the soil is very cold. However, the suggestion is purely hypothetical. The fact remains that the Carrot failure is a very general one.—A. DEAN.

### Hints on Budding Roses.

No amateur has, I believe, read with more pleasure than I have the "Garden Notes" which have appeared at intervals in the columns of the "Standard" on general subjects connected with the popular study and practice of horticulture. The advice given has been so admirably simple, within the compass of the veriest tyro, and thoroughly up-to-date; while the style in which the advice is given is so broad and exhaustive, so scholarlike and technical (just academic enough without being unduly pedantic), that "Garden Notes" whenever they have appeared have been hailed with universal acceptance, not only by devotees to gardening, but glanced at by most readers, who find enjoyment in obtaining information on a subject like horticulture at all seasons of the year, directly or indirectly, full of interest when treated with that ability which can only come from the hands of a writer of great experience and thorough master of the varied subjects he treats about. The readers of our Rose Journal, I believe, will join in my surprise when I read in "Garden Notes" in the "Standard" of July 22, in a detailed account of the practice of budding Roses, that "a 4in long cut should be made, that is, about the same length as the sheath of the bud intended for insertion." Now this is so manifestly wrong, and I hold so unusual, that I should be inclined to attribute it to an error of the printer were it not repeated twice, as being of extreme importance. All other directions on the subject are good; this undoubtedly is wrong

and dangerous, as 2in is well within the normal length of any bud to be inserted—indeed, I can fancy the smile on reading the passage that would creep over the faces of the vast number of lads who do the budding at the large Rose establishments, while the foreman sees to the supply of well-seasoned buds and that the nomenclature be correct.

Having a long practical experience of budding Roses, I should like to take this opportunity of adding a few hints as to what I have always found cardinal rules for successful budding. First and chiefly (as to Briars), ripe, well seasoned buds, from shoots that have flowered, are preferable, these should be, for choice, as nearly as possible of the same stage of maturity as the wood in which they are to be inserted. Secondly, seeing that it is of the utmost importance that a minimum of friction (or bruising) should take place during the delicate operation, the "slit" should be absolutely straight, when the bud will slip into its place almost invariably of its own accord. Thirdly, on the general principle that "Nature abhors a vacuum," it is equally important that, by pressure of the finger and thumb, the bud inserted should be firmly and evenly located in its new home. Scores and scores of buds fail to unite and become homogeneous with the stock through neglect of these simple precautions. Like every act of ordinary manipulation, practice makes perfect; in point of fact, every budder soon finds out this for himself, by increased despatch over his work and facility of action.

As regard budding on Manetti stocks, this work, barring the stooping, is much easier, and, given plump, well seasoned buds, much more certain in its successful results. The buds are inserted just below the ground, and always tied up with raffia or bast matting, which soon perishes but lasts sufficiently long for the bud and wood to unite. I prefer for Briars cotton (four to six thread hanks) in preference to wool, as not cutting into the wood and a far better preventive against heat and cold. Certainly bast is not to be recommended, as by the writer in "Garden Notes," for Briars, though, as aforesaid, necessary for Manetti budding.

In tying up, I have only to add that the general practice is to bring the cross-ties very flush over the cap of the bud, and not too close in front of the bud, and this chiefly for the reason that the bud should repose on an even surface everywhere on the wood.—HEREFORDSHIRE INCUMBENT.

### Wanted—Slaves.

I take the liberty of sending you the enclosed, which is one of the answers I received from an application for a situation. In common with many gardeners I appreciate the many efforts you make through your Journal to improve our prospects. I do not want the letter again, so that if it pleases you to print it you are welcome to do so. I think you will agree that the person writing asks rather a lot.—J. R. E., July 16.

The letter referred to is the following:—"In reply to your letter, what I want is a married couple, without family, industrious, sober, honest, and trustworthy. The house is quite a small one, and I do not entertain, except occasionally to tea, but I sometimes have visitors. There are no lawns, only grass plots in front with flower beds and borders. There is a rather large kitchen garden where Potatoes and the usual vegetables are grown. There is a small conservatory and a range of glass houses—two 100ft by 12ft, and one 80ft by 17ft—where pot plants, Tomatoes and Cucumbers are grown for sale. One of these houses is heated by hot-water pipes.

"I usually have a boy to help, and there is one now; but I may not always be able to get one. I require the gardener to be well up in his work, and not to need constant supervision. I do not require him to be an abstainer, but he must be sober, and as there is a publichouse opposite my side gate I strongly object to his frequenting it in the daytime. I expect the place to be kept neat and clean—like a gentleman's residence. There is also a meadow and I have had, and may again have a pony for riding.

"The wife must be a good plain cook, do all the housework and mending, and help the woman who comes to do the washing. As I am often away from home I must have trustworthy people who can be left in charge. The wages are £1 a week, with the kitchen and bedroom, coals and light, vegetables from the garden, but not other food. The situation will be vacant in about three weeks' time."

### Holidays in Belgium and the Ardennes.

We have received a copy of the Great Eastern Railway Company's new illustrated booklet, entitled "Holidays in Belgium and the Ardennes," by Percy Lindley, describing new inexpensive holidays, via Harwich and Antwerp, in Flanders and the Ardennes. A special feature has been made of the tinted illustrations. Apply at 30, Fleet Street, London, E.C.

## NOTES

## NOTICES

**Gardening Appointments.**

Mr. Joseph Booker has succeeded Mr. E. Bambridge as head gardener to Lieut.-Colonel Shipway, at Grove House, Chiswick, London. Mr. Bambridge has been appointed head gardener at Dene Park, Tonbridge, Kent. \* \* Mr. David Murray, for the past two years foreman in the houses at Carberry Tower, Musselburgh, has been appointed head gardener to J. D. Cobbold, Esq., Holly Wells, Ipswich.

**Royal Horticultural Society.**

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, August 4, in the Drill Hall, Buckingham Gate, Westminster, 1 to 5 p.m. Special prizes will be given for Cactaceous plants. A lecture on "Landscape Gardening" will be given by Mr. H. E. Milner, V.M.H., at 3 o'clock. At a general meeting of the society held on Tuesday, July 21, thirty-six new Fellows were elected, among them being Lady Arthur Hill, Lady Margaret Cecil, Sir Philip Magnus, and the Hon. Gerald Ponsonby, making a total of 1045 elected since last January 1.

**The Veitchian Cup.**

In order to celebrate the jubilee of the establishment of a business in London (Mr. James Veitch, jun., having come to Chelsea in 1853), Messrs. James Veitch and Sons, Ltd., have presented to the Royal Horticultural Society five silver-gilt cups of the value of fifty guineas each. This liberal offer has been accepted by the Council, and the following conditions drawn up: The cup will be known as "The Veitchian Cup," and one will be awarded once a year to the best individual exhibit in the opinion of special judges at the Temple Shows of 1904, 1905, 1906, 1907, and 1908, or any other leading show held under the direction of the Society the Council may determine. The successful exhibit may be either a single plant, or a group, a novelty, or an example of culture. The cup will become the property of the winner each year, and he will be required to make a declaration that the exhibit is his own property, and has been cultivated by him for fourteen days previous to the show. The judges are to be seven—three amateurs, two gardeners, and two nurseryman or seedsmen—to be selected by the Council. No exhibitor can win more than one cup.

**Exhibition of Edible Fungi.**

On Tuesday, September 15, the Royal Horticultural Society will hold an Educational Exhibition of Edible Fungi in the Drill Hall of the London Scottish Volunteers, Buckingham Gate, Victoria Street, Westminster, and a lecture upon them will be given by Dr. M. C. Cooke, M.A., V.M.H., &c., at three p.m. All interested in extending or acquiring the knowledge of the edible species are invited to send collections. Collections should, if sent, be delivered at the Drill Hall, on Monday afternoon, September 14, or if brought, should arrive at or before nine a.m. on the Tuesday, so that they may be properly grouped and arranged by the fungus specialists. Collections should consist of any fungi supposed to be edible. Each specimen should be wrapped separately in thin or tissue paper, and packed so as not to get loose or shaken in transit. When the names are known by the senders they should be neatly written on card and enclosed, but if not known they will be named by the experts. The society will pay the carriage of all collections, and will award medals according to merit. The best collection will be considered to be that which includes the largest number of edible species shown in the best condition. When the senders are doubtful as to whether any of the specimens are edible or not, the matter will be determined by the experts. Unnamed collections will also be examined, named, and sorted into edible and poisonous by the experts as far as their time will permit. All specimens will be destroyed at the close of the meeting unless removed by the senders. Intimation of an intention to exhibit should, if possible, be sent a few days before to the Secretary, R.H.S. Office, 117, Victoria Street, London, S.W.

**A Wonderland of Trees.**

Nowhere else in the world is there such a forest of trees as that which spreads itself on the Rocky Mountains. Thousands of miles one may wander and never escape the enclosing silences of this wood. Across British possessions, through endless reaches of snow-capped mountains, and onward to Alaska, nothing but trees and trees—Cedar, Fir, Hemlock, Pine, Spruce. Turn to the south. For a thousand miles of Sierra, through the heart of California, where grows the Sequoia, the monarch among trees, to the very deserts of the Mexican border, and still one finds this forest covering all the hills, thick, silent, and all but undisturbed. —("The Sun.")

**Fruit in Kent.**

Although a number of dismal reports have reached us as to the disastrous fruit crops in Kent this year, it is pleasing to learn (says the "Kent County Standard") that Apples will be a trifle better than was predicted six weeks ago. The home supply of fruit, we are told by a correspondent, would be still greater if it were not for the uncertainties of the seasons. If these could be minimised by an extension of cheap, artificial protection from the weather it would be a great advantage to the producer and consumer. Whether the expense would be justified is the point for consideration. There has already been an immense increase in the area under glass for the Cultivation of Grapes, Cucumbers, Tomatoes, &c., and it may be that the scarcity of British fruit attempted to be grown in the open this year will result in such an increased demand for varieties cultivated under cover as may tend to a further extension of the system and its application, in a cheaper form, to other crops.

**American Apples.**

The great Apple district in America lies in the country bordering the great Lake Ontario—half in Canada, half in Western New York. The Apples of Michigan and Missouri now find a market in the cities of the West and South. Their keeping qualities are not quite equal to those of Canada and New York. Last year the months of May and June, after the time of blossoming, were excessively cold, with constant and copious rains, succeeded in July by abnormal heat. One quarter of the Apple leaves turned yellow and fell off, and then there developed a new or very rare disease called "pink rot." This is a well-known fungus, but heretofore it has only attacked dead wood, and to find it on growing Apples was an unlooked-for calamity. It was first noticed in August, in the form of a white or pink mildew around scabs. Later it produced a brown, sunken, rotten spot with a bitter taste. The spread of the trouble was very rapid. It developed in fruit packed for shipment, and ruined many thousands of barrels, which had to be thrown away or sent to the jam factories. So far this year the weather conditions have been ideal. The trees blossomed freely, though many of them only on one side. During the whole of May there was practically no rain, the pollination was perfect, and the fruit set finely.

**Importation of Fruit.**

The fruit import statistics for the past month contain some striking details. The Apple receipts for June are larger than they have been for a corresponding period for the past three years, says the "Yorkshire Herald." The total for the six months ending June is 1,221,818 cwts, valued at £808,989. As to Bananas, despite the huge consumption last year, they are increasing in popularity by leaps and bounds. Though we have a full crop of Gooseberries this season, yet the imports of this fruit are larger than they have ever been before. The imports equalled 14,862 cwts. The total value of the Gooseberry imports up to date is £13,748. This is most significant. The Red and Black Currant imports came to 5,465 cwts, for June. Last year for the same period the total was 3,027. There has been an increase in the Grape imports, the bulk of which come from the Channel Islands. This past June we paid £61,418 for Lemons. The quantity imported was 135,874 cwts. This shows an increase of 52,686 cwts compared with the receipts for June, 1902. The total value of the six months supply ending June was £215,117. The Tomato imports were larger this past month than they have been for three years for the same period. 146,895 cwts were sent us, and they cost us £122,533. In addition to the fruits named, the arrivals of Oranges, Pears, and Plums were of a very satisfactory nature.

**Southampton Show.**

It gives us great pleasure to state that we owe much of the excellence of the interesting views of this show given last week to the special consideration shown to our representative by the secretary, Mr. Fuidge.

**The School of Handicraft.**

The annual outing of the School of Handicraft Garden and Farm Boys and Staff, accompanied by the band of the school, was held on July 16, when they proceeded down the river to Maidenhead on the "Sunbury Belle" accompanied by friends. The gardens on the river side were much admired, the Roses looking particularly well, and the house boats. The thanks of the boys, &c., are tendered to all who helped towards the outing. Amongst them being Mr. H. Veitch, Cooper, Faber and Co., Sutton and Sons, Watkin and Simpson, Hurst and Son, H. B. May, and others. The party was under the charge of Mr. A. J. Brown, horticultural instructor.

**A Strawberry Feast.**

On a recent sunny morning, two costers were gaily flying down Piccadilly in a ramshackle cart laden with fruit and vegetables. Strawberries were amongst the complement, but, alas! they were loosely packed, and the swaying and jolting of the vehicle was the means of scattering these soft and luscious products broadcast over the roadway, and there they lay or rolled like the gravel that the scavengers scatter, much to the amusement of the hackney drivers and 'bus-men. But a trio of street arabs made good the occasion by diving forth among the traffic, greatly to the danger of their lives, but to the betterment of their stomachs once they safely landed back upon the kerbstone. They had a Strawberry feast.

**"The Century Book of Gardening."**

Less than two years ago this book was published by Geo. Newnes, Ltd., Strand, London, and was so successful that a second edition is already well on the way to completion. This is being issued in sixpenny parts, and we have contemplated a brief review of the earlier issues, which, however, our other duties have precluded our giving. The parts are now up to No. 12, and as the whole phase of gardening is treated herein by experts, the illustrations being numerous and beautifully reproduced, we have no hesitation in saying that it is well spent money to secure the numbers as they come out, and a bound volume can be made when all are issued. When the last appears, if not before then, we hope to be able to give the work due notice. Mr. E. T. Cook is editor.

**The "Undergraduates" at Kew.**

There are sixty of these young men at Kew, and not one among them could fail to make more than the living wage of a guinea a week which they are allowed. For no applicant is considered who has not served five years as a gardener and acquired a knowledge of all the manual details of the trade. When the young gardener obtains his place at Kew he is at once taught that he is one of the aristocracy of the profession. The labourers may dress as they please. The gardener must appear in a blue serge suit, with flannel shirt and low collar. And he works. For those two years he has a twelve-hour day, from six to six, and when that day is over he is ready to take his place in the lecture-room, notebook in front of him, and dive into the chemistry of plant life. No one but a man determined to succeed in life would throw up his easy job and return to the labourer's wage for a couple of years—*pour mieux sauter*. The reward comes, however, and the Kew degree—or rather the Kew certificate—holds good all over the world. From King Leopold's private gardens to the Botanical Gardens of India and South Africa you will find in charge the man who put in those two years at a guinea a week at Kew. And the curator of the Kew Gardens himself, Mr. Watson, a man whose knowledge of all things that grow is an amazement to those who consult him, was once a gardener undergraduate. Now that the gardens are filling up with early summer visitors you may be advised to turn for a moment from the show places and the tea tables to look at those keen young men who are fighting their way from gardening to botany. For these are the men who are to aid Nature in planting the earth with what it will foster; the men who are intent on making two blades of grass grow where but one grew before.—("T.P.'s Weekly.")

**Tree Planting in South Africa.**

Mr. J. Barclay revives an old suggestion for the "amelioration" of South Africa. He pins his faith to trees. He writes: "An afforestation of the country to the extent of from five to ten per cent. would undoubtedly materially alter the climate for the better. Since the plantation of woods around Johannesburg the annual rainfall in that district has increased by three inches. By planting the ridges of the rolling plains of the Orange River Colony, their area would be protected from the scorching hot winds of summer, and their moisture would percolate to the lower lying soil, while the general increased moisture of the soil would very likely mitigate the severity of the terrific summer thunderstorms."

**East Ham and District Horticultural Society.**

A large party of members and friends of this society, to the number of about 130, visited the gardens and grounds of Gunnersbury Park and Gunnersbury House, on Saturday last, by the kind permission of Leopold de Rothschild, Esq. The day was beautifully fine, and the visitors were free to visit the houses and all portions of the grounds, and they appeared to greatly enjoy their beauty, and the evidences of high class gardening seen on every hand. The Japanese garden and its surroundings, together with the long window tank containing the blue Water Lily, *Nymphaea stellata*, were great features of attraction. Tea was served in what was formerly the conservatory adjoining Gunnersbury House; and as the shades of evening began to fall, the visitors took leave of the charming grounds deeply grateful for the permission given to view them.

**Prices of Fruit.**

New Lisbon Apples are selling at 14s. a case first hand. The fruits are medium in quality, but the supplies will be plentiful. Some very fine Mangoes from Bombay have made their appearance in Covent Garden Market. They are selling at from 12s. to 18s. a dozen fruits. Vegetable Marrows bring from 4s. to 8s. a dozen in Covent Garden Market, the usual price in ordinary seasons at this time of the year being from 3s. to 5s. per tally of sixty. Scarlet Runner Beans sold at 6s. a dozen pounds, which is the highest price for the first consignments known. Huge quantities of Bilberries are being imported this season in consequence of the scanty Black Currant crop at home. In one week recently as many as 20,000 packages were unloaded at Grimsby.

**A London Fuchsia.**

London's atmosphere in Finsbury was amply vindicated on Saturday at the Cottager flower show, which was opened in Peel Institute, St. John's Lane, Clerkenwell. A Fuchsia, reared at the model dwellings in St. John's Square, was of such remarkable growth (says the "Daily Telegraph") that Mr. Dean, F.R.H.S., said it deserved photographing. It stood nearly 4ft high, and was 3ft across; and Mr. J. W. Tosh, the hon. sec. of the show, assured the audience that four years ago the grower (Mr. Bird) bought it as a small penny plant. There were 300 exhibits in the show, all testifying a surprising healthiness, seeing that they had been grown on window sills, on the roofs of the houses, or in the backyards. The ex-mayor (Mrs. W. Howes) presented the prizes.

**The Protection of Orchards.**

Although the Prevention of Diseases (fruit trees) Bill has been dropped, the movement in favour of legislation for the protection of orchards and plantations is being vigorously pursued. Mr. C. W. Radcliffe Cooke, who is taking a leading part in the matter, seems to anticipate that the objections of nurserymen will be met if the provisions of any future project of legislation are extended to all fruit growers. He writes:—"That any measure of the kind will occasion some trouble and inconvenience to the nursery trade is undoubted, but not more than agriculturists now experience by the working of the Acts relating to the diseases of animals. Just as farmers submit, often at great inconvenience and pecuniary loss, owing to the provisions of, and the restrictions imposed by, the Acts dealing with the contagious diseases of animals, such as foot and mouth disease, anthrax, sheep scab, and swine fever, because they know that their industry at large will be benefited by the stamping out of these diseases, so nurserymen and fruit growers will, it is to be hoped, exhibit an equal amount of self-denial and public spirit for the sake of the industry in whose healthy and flourishing condition all of them are concerned."

## Raising Seedling Carnations.

The raising of seedling Carnations is one of the most fascinating pastimes the experimenter can engage in. It is fraught with hopes, fears, and disappointments, and frequently, to the severely practical man, apparently unjustifiable elations. There is a number of practical florists, and some amateurs, engaged in the raising of seedling Carnations with a view to their improvement, and there are many others who would take up this laudable undertaking if they knew just where to begin. It is for the latter class that this article is prepared.

It is interesting to know the origin of meritorious varieties, not for the purpose of repeating the experiment, for it is ten thousand chances to one that the results would be the same, for there are rarely or never two varieties that might be pronounced identical, even from the same seed pod. But it is so much knowledge to our credit, and it may act as a guide for future operations. Though he who thinks he will electrify the floricultural world by his achievements after he has learned the pedigrees of the best sorts by heart may be disappointed, yet such is among the possibilities.

A novice might effect a cross between two varieties without any idea as to what the effect would be, and the result might be greater than that of a person who has been experimenting with a definite object in view for years. This is where that element which is known as luck comes in. Yet there are very few, we venture to say, who have ever indulged in this mild form of excitement who would throw aside system, no matter how fortunate someone else may have been in a haphazard way, and depend entirely on luck. We believe in pedigrees, for by careful records, with close observation, we may note the influence of varieties as breeders; some may be much more potent than others.

In explanation of the illustrations, fig. 1 is a Carnation flower showing the pistils prominently, which may be called the pistillate, seed or female parent, all of which are synonymous terms. Fig. 2 is a flower which shows the stamens conspicuously; these furnish the pollen with which to fertilise the pistillate flower. Generally speaking, a Carnation flower may be made either the pollen or the seed parent, as the operator may determine, though there are exceptions to this rule. We found this out some years ago when hunting among some flowers of the variety Duke of Orange for pollen, but not a grain could we find. On the other hand, we have operated upon varieties which did not produce perfect seeds.

In fig. 3 we find a representation of a flower ready to be operated upon. The petals have been carefully removed with the finger and thumb, part of the calyx has been cut away by a sharp pair of scissors, showing the ovary with the pistils standing out above.

Fig. 4 gives the stamens and pistils. The stamens are the more apparent, and shows the pistils

before they have developed far enough to be fertilised. Fig. 5 is similar to the last. On close examination it will be seen that some of the pollen cases have burst, thus freeing the meal-like pollen which may be carried by a camel's-hair brush, to which it readily adheres, and applied as seen at fig. 6, where the operator is in the act of applying the pollen.

Camel's-hair brushes may be obtained at a very trifling cost. Where there is any choice it is best to select the darkest brushes, as the pollen grains are more readily seen on this material than when it is of a greyish colour, thus giving the practitioner a better idea what he is doing. In all our operations there is always a danger present and a possibility of self-fertilisation. To avert this

it is better to remove all the petals and stamens at an early stage of the flower's development, before the stamens have had time to ripen its fructifying grains, thus destroying a possibility of frustrating our plans.

Fig. 7 gives an idea how the seed pod should look when it has advanced somewhat, although this illustration is more to show the manner of keeping a record of the cross made. Some prefer to mark the tag only with a number and to keep in a note-book the full particulars, but if the note-book happens to get lost the numbers are very little value. A full record on the tags is best, then there is little or no danger of losing it.

It is cheaper to buy the little tags than to make them. They are sold with strings already attached, which renders them easily adjusted, and gives the whole operation a neat and workmanlike appearance. In recording the cross, the name of the seed parent comes first. Whether it is correct to make a plus mark or a multiplication mark ( $\times$ ) we have not been able to determine. We may multiply varieties without adding to their quality. Each one may make the mark which suits him best.

### Carnations from Milburn.

Writing from Milburn Gardens, Esher, Mr. G. H. Cook says: "I am sending you Carnations,

Princess of Wales, Cecilia, and a red one as yet unnamed. They have been grown precisely under the conditions described by me in my article on page 3 (last vol.) of your journal. My method of wiring may be of interest to some of your readers. I find it very satisfactory, and much better than the rings or tying them."

[Mr. Cook's wiring is simple. He uses pliable wire, this being looped under the petals about the top of the calyx, the rest of the wire being twisted round the flower stems. They can be fastened to a stout stake down amongst the foliage. His flowers were very good samples.—ED.]

### Early Outdoor Peaches.

In a large measure, due to the cold and chilling spring, the early Peaches, what few there are left, are ripening prematurely, and in advance of last year's date. Every fruit gathered so far has split stones, a failing sometimes attributed to an absence of sufficient lime in the soil.

The trouble complained of is not an annual one here, indeed; but very rarely has there been a split stone fruit gathered in previous seasons. Ample lime is afforded for stone fruits, obtained, when possible, from demolished buildings. When this source fails, then newly-slaked lime is applied, and since the growth of the trees is so free, and the usual tendency to bear fruit with an ordinary freedom, soil condition cannot be so very far wrong.

The greater wonder, however, is not that the stones should have become ruptured, but that there are any Peaches at all left remaining, for the spring frosts were so severe that there appeared then no prospect at all. The weather has been a series of extremes so far this year. Cold winds, frost, heavy rains, and hot sun have been successive experiences. Alexander and Waterloo are the varieties grown for early gathering outdoors, and which do so well in ordinary seasons.

Last year they bore heavily, and gave fine, well-coloured fruits over a fairly lengthened season. The first fruit then gathered was on July 20. This year the fruit was pulled ten days earlier, but as these are not perfect specimens, and hastened by their ruptured stones, time cannot be said to be fairly gained.

Though Peach trees on the open walls in some gardens now look so well, instances are not wanting where they still show unmistakable signs of the inclement spring. Soil and shelter no doubt account for these troubles, the first-named in particular. It is interesting to note that Peaches, even on glass-coped walls, show an absence of fruit on the lower portion of the walls, say a third of their depth. This is due to the greater extremes of cold near the soil. There are trees bearing their customary crops on the upper portions of the walls, and a few cases are found where a full average are developing over the whole surface, but these must be rare, and due to peculiar and local means of shelter.

Those favoured with a Peach crop have reason to be grateful, for the dearth of other summer fruits will render these of greater than their ordinary value, and be most acceptable for the dessert supply. Amsden June is a variety equally dependable for the open walls, and so is Early Rivers Nectarine, and those provided with an irregular supply from indoors should make an effort to accommodate at least a tree or two of these early Peaches and Nectarines. Hale's Early is a splendid successional variety, hardy, and free fruiting; and Condor is another that deserves a place.

Bud dropping, so common a failing of the American Peaches under glass, is scarcely known outdoors. Instead of a dearth, there is more frequently a difficulty in thinning down the fruits to a reasonable limit.—W. S.

### Melons.

**LATE FRUIT.**—A sowing should be made early in August to afford very late Melons. The plants will be fit to plant out in about a month, they will set fruit in September, and that will be ripe in November. Gunton Scarlet (scarlet-flesh), Middlesex Hero (green-flesh), and Longleaf Perfection (white-flesh), are good varieties. A light, airy structure, well heated, is essential with high culture for this crop. Bottom heat is necessary, and is best afforded by hot-water pipes.

**EARLY AUTUMN FRUIT.**—Good looking fruit is always esteemed, if only from a decorative point of view, and when the quality is high the advantage is duly appreciated. To have fruit ripe in October the plants should be planted out at once, giving them about a barrowload each of soil, made into a flattened cone or ridge about 10in deep in the centre. Rather strong loam, with a fifth of sweetened horse droppings and a sixth of old mortar rubbish form a suitable compost. Make this quite firm, and leave it in a moist state before planting. Turn the plants out carefully, watering them overnight, so that the roots may come freely from the side of the pots, and make the soil firm about the balls. Keep the stem slightly raised, and water to settle the soil about the roots. The plants must be encouraged to make a free growth by syringing at closing, and damping the paths and walls in the morning and evening of hot days. Ventilate between 70deg and 75deg, and keep the temperature through the day at those degrees by artificial heat, 85deg to 90deg from sun, and

close so as to raise to 95 deg or 100deg. Through the night the temperature may fall to 65deg.

**FRUIT SWELLING.**—The ultimate result must be kept in view from the start, as sturdy plants only produce fine fruit, and this may be spoiled by overcropping the plants. When the fruit is fairly swelling the crop should be reduced to one or two on a weakly, three on a moderately vigorous, four on a strong, and six on a large plant. Overcropping is very prejudicial to the plants' health, and unless the foliage is in good condition to the finish, high quality, which mainly depends on solidity through the high elaboration of the juices, cannot be expected, therefore keep the foliage thin, having full exposure to light. Earth the roots, giving copious supplies of water or liquid manure, and damp the paths with liquid manure twice a week, but it is best to give it often and weak. The weak drainings of stables should be diluted with five times the bulk of water.

**FRUIT RIPENING.**—The atmosphere should be kept dry and a top heat maintained of 70deg to 75deg by artificial means, admitting a little air constantly, a circulation of rather dry, warm air greatly improving the quality and finish when ripening. Water should be withheld from the house unless there is fruit advancing in swelling, when an occasional damping will be necessary for the benefit of the foliage.

**PLANTS IN PITS AND FRAMES.**—The latest plants will be setting their fruit, it being important that the fruit be set at the close of July or early in August, to allow time for its swelling and ripening. Give a good watering if necessary before the flowers open, and line the sides of the frame with hot dung, or the mowings of lawns, and give a little ventilation constantly at the top of the lights until the fruit is set and commences swelling. This prevents the deposition of moisture on the blossoms and insures a good set. Fertilise the flowers daily, and when sufficient are set, and the fruit swelling about equal size, remove all flowers, and keep the growths thin and well stopped, maintaining a warm, moist atmosphere, but not stagnant, by early closing with sun heat. Sprinkle the foliage on fine afternoons, and afford water in bright weather about twice a week.—G. A.

### Where our Fruit Comes From.

The home crop of fruit will be light, and generally the shortage will be serious. On the other hand, the foreign imports are not only plentiful but varied, as the following facts obtained from inspection of the arrivals prove. The bulk of the Strawberries on sale, says a correspondent to the "Newcastle Chronicle," comes from Holland. A few still are consigned from France, but the season is practically over. The Dutch shippers bring us from 2,000 to 3,000 packages a week.

Peaches put up in shallow boxes reach us from the Paris agents, but at present the arrivals are limited. These growers are sending fair quantities of Plums, the season for this fruit being well opened now. They are put up in baskets and boxes, the latter containing the Green Gage variety. A few Spanish Plums in boxes are on sale. The Red and Black Currants have been grown in Germany, Holland, Belgium, and France, the largest quantity coming from France.

The Gooseberries are of Dutch, Belgian, and French growth. Out of 2,277 packages received last week, 2,149 came from Holland. They send huge supplies of cheap berries into our markets every year. The whole of the Apricots now on sale are French. The growers pay special attention to the culture of this fruit for the English markets. The Apricots are packed in clean one-layer boxes chiefly, and are attractively arranged with the aid of coloured tissue paper. This season, an unusually large quantity of Bilberries are being sold in our markets. They reach us from Germany and Holland, and at the rate of 20,000 and 30,000 packages a week. Black Currants being short this year Bilberries are sold as a substitute for that fruit. In the Midlands these juicy berries are immensely popular. Of course they have not the flavour of the Black Currant; still, they are rising in favour. This is due in a great measure to the fact that the fruit arrives in excellent condition. The time occupied in shipment to Grimsby is short, and distribution soon follows its sale by the auctioneers.

The new Apples in cases are Spanish, and the new season's fruit is coming to hand in large quantities. Last week we received about 6,000 boxes, out of which 5,568 were unloaded at Liverpool, for distribution in the Midlands. Cherries are arriving from France, Germany, and Holland at the rate of from 5,000cwt to 10,000cwt a week. The foreign Cherry crop is, therefore, a heavy one. The Bananas are sent by Jamaica and Canary shippers, and the receipts are enormous. Last week, 31,650 bunches were consigned to Manchester from Jamaica, 28,426 to Liverpool from the Canaries, and 28,452 to London from the latter centre, with 170 from Madeira. These imports beat all previous records.

The Orange arrivals from Italy, Spain, and Jamaica have in the aggregate been heavy for the time of the year. The past week's imports exceeded 15,000 cases. Nearly all of this total came from Spain. The Tomato is now classed as a fruit, and from 25,000 to 30,000 boxes of them came in from Italy, Spain,

and the Canaries, the largest quantity being of Spanish growth. A few new Pears from Paris have arrived, but the supplies will be short for a week or two yet, though there are plenty to come.

The Pineapples have been raised in St. Michaels, a centre once famous for its Oranges, but now devoted to pineries on a most extensive scale. It is not an easy matter to deal concisely with the foreign fruit import statistics because of the imperfect nature of the tabulations. For instance, last week, over 120,000 packages were entered as "unenumerated." This is sufficient to cast discredit upon the whole of the items furnished officially by the Customs House authorities.

The Belgian Grapes are more conspicuous this year than ever. We are receiving of them from three to four tons a week, the fruit being glass-house grown and put up in fancy baskets. In these notes reference is made to foreign fruit only, though, in addition to green Figs, Melons, and Tomatoes, we imported 25 tons of Grapes from the Channel Islands last week.

## Cucumber Culture for Market.

### Winter Treatment.

Cucumbers are now grown for market in such enormous quantities, during the summer season at any rate, that the price frequently falls to an unremunerative point. As the cold weather draws on the prices rise again, and though the demand is seldom very brisk during the late autumn, yet in the New Year and early spring, good prices are often obtained. The prices of twenty to thirty years ago, however, when "Cues" often made twenty to thirty shillings per dozen in the early part of the season, are never obtained now, and probably never will again. In these days, if a grower gets ten or twelve shillings a dozen for his earliest house of fruits, he thinks he is doing very well; and often it may only realise six or eight shillings a dozen.

A summer crop of "Cues" costs considerably less to grow than a winter one. This is not only due to the great difference in the amount of fuel required to maintain the necessary temperature, but in a considerable degree also to the equally greater productiveness of the plants themselves, summer grown plants possessing more vigour and strength than the most skilfully grown of those cultivated to fruit during the winter; and for one fruit cut from the latter, a grower can often cut four or six when the days are long and the solar heat abundant. It is useless to attempt to secure a crop of "Cues" in the winter unless there is a house at command in which a temperature of 60deg to 65deg can be steadily maintained. Even in the mildest weather, a gentle bottom heat is absolutely necessary, for the plants will not thrive on a cold bed.

Winter "Cues" cannot be profitably grown within a couple of miles of any large town, on account of the smoke. The soil must also be of a suitable character; "Cues" do not thrive to any extent, or for any length of time, in a very light soil, the best material being a fairly substantial loam of a moderately turfy description, preferably that which has been stacked up for some time, with about one-third of its bulk decayed manure. Some growers advise cuttings for winter work, but I prefer raising plants from seed, which should be sown the beginning of September; they will then be ready for planting the second week in October. From thence you should be cutting "Cues" by the New Year.

The plants should be put out 3ft apart; a crack of air should be given the first week or two after planting, if the weather is bright. When the plants are three-parts up the roof, the point should be taken out; the lateral growth should then be stopped at the third joint. Do not let the plants bear fruit on these shoots, but wait until the secondary growths from them show fruit, and then stop them, leaving one leaf beyond the young "Cues." Water very carefully. A nice, moist, growing atmosphere must be constantly maintained. Keep the glass clean, and take care not to overcrop the plants at any time.

### Summer Treatment.

I will now deal with the summer treatment. Any of the first few weeks in the year, say from the 1st of January to the beginning of March, is as good a time as any to commence the culture of Cucumbers. When the plants are raised about this time they get the benefit of the constantly increasing daylight and sunshine, and with ordinary care and attention they consequently grow right on without a check of any kind. As a rule they make far more vigorous and productive plants than any that are grown during the autumn, and which have to undergo the ordeal of the short, dark, and sunless days of winter just at the time when they ought to be getting into a fully productive condition. The consequence is, that though "Cues" produced during the latter part of the spring and through the summer seldom if ever realise such high prices as the winter and early spring fruits, yet they are often more profitable in the end, owing to their much greater

productiveness, as well to the much smaller quantity of fuel required to produce them.

The best structure for "Cue" growing is a span-roofed house about 12ft wide, and from 6ft to 7ft high in the centre. Inside of this a 4½in brick wall should be built at each side, making the bed 2½ft wide. A row of hot water piping should run through the bottom of the bed—a flow if possible, with a valve, so that the heat can be turned on or off when required. The bed should then be filled up with littery manure, or, if procurable, tan, which suits the purpose admirably. On this bed the soil should be placed. The soil should not be broken up finely; the rougher the better, always using two-thirds loam, and one-third manure, with a good sprinkling of soot and bonemeal. I think bonemeal one of the best feeders for "Cues" you can get, but it must be given to them at the commencement, as it is a slow feeder, and there are other manures more active which can be applied later on.

The soil, after being well mixed, should be placed on the bed. Some growers put it in mounds; I always put it in a continuous ridge, which I believe to be better for the plants, and saves a good deal of labour. In this way "Cues" thrive capitally, as the gentle bottom heat ascending through the tan or littery manure keeps the roots in a healthy and active condition, and with plenty of heat and moisture above, and proper attention otherwise, the plants will succeed.

For raising the seed you want a nice light soil with a little leaf soil added. This should be made moist (but not wet), so that the seeds will not require any water until they have germinated. The seed should be sown in a box, three-parts filled with soil, then lay the seeds an inch apart. Put a good sprinkling of soil on, then plunge the box in a bed with a gentle bottom heat. About a week after the seeds have come up, they should be carefully potted into 3in-pots, and again plunged in the bed. When they have made three or four rough leaves they should be planted out into the bed. Plant them so that the seed leaves are just above the surface of the soil. A good distance for the plants is 3ft apart.

After the plants are established they will require a good deal of attention; in fact, you must not neglect them in any way, for if you do they will very soon tell tales.

A great mistake is often made in stopping, or pinching-out the points of the plants too soon. Of course, when grown in frames this must be done in order to get the two or three shoots necessary for each plant; but under house culture it is much better to let the plants grow two-thirds of the way up the rafters before taking out their points. After this is done they will shoot out from the axils of the lower leaves quite naturally. These shoots should be stopped at the second joint; in fact, from now on, all shoots should be stopped at the second joint and allowed to fruit. The plants grow much stronger at this time of the year, and are therefore well able to bear a crop of fruit on the first lateral. Directly the points of these lateral shoots are pinched out the fruits below will begin to swell, and will soon be in bloom. There is no necessity to fertilise the blooms of "Cues" unless seed is wanted. Once having flowered and set, the "Cues" swell very fast in a warm moist atmosphere, and by the time the fruit is ready to cut other young shoots will have pushed from each of the first, and these must be stopped, allowed to fruit, and then to produce another lot of growths again. However, do not allow these young shoots (which quickly multiply if left alone) to become too numerous, for if they get at all crowded they will also become weak, and are then unable to bear. Thin them out moderately from time to time, but avoid making a big clearance all at once. Little and often is the best rule.

All that are retained must be securely tied to the wires, using the best raffia. All shoots that are carrying fruit should be tied on each side to prevent the growth breaking away from the wires. When the plants are in full growth and bearing, liquid manure should be given them once a week. Almost anything will do, and the more the liquid is varied the better. Frequent top-dressings should be given, or so often as the roots work through on to the surface. This is most important, and for this a good heap of prepared soil should be kept on hand, and in cold weather it must be warmed by keeping it inside the house.

A mixture of fresh loam, decayed manure, with a sprinkling of soot and a good artificial fertiliser will answer well. Apply from 1in to 2in of this at a time. A good plan previous to top-dressing is to water with a weak solution of ammonia. This brings the roots to the top, when they can be well covered with the fresh compost, and the plants are greatly invigorated thereby. "Cues" enjoy a high temperature, and as a rule, the hotter the weather the better they thrive, provided only that they have moisture. At the same time, to have heat without moisture spells ruin, and care must be taken to keep the plants in a constantly moist condition above and below. All available surfaces must be damped down three or four times daily, according to the weather, allowing no part of the house to remain dry for any length of time. If this is done regularly the syringe will only require to be used occasionally.—(Read before the Cardiff Gardeners' Association on February 24 by Mr. WALLER, Cucumber grower to Messrs. Nurton and Co., Dynas Powis, Glamorgan.)

(To be continued)

#### *Lilium speciosum.*

The true Japanese *L. speciosum*—a slightly confused plant so far as naming is concerned—has fair-sized, roundish bulbs of a reddish tint, and stiff, wiry stems 1ft. to 3ft. high, clothed with lance-shaped leaves 4ft. to 6ft. long. The flowers are 3in. to 5in. across, and white, suffused with deep rose in the type, or pure white in *L. s. album*. The jagged surface growths are characteristic. Plants cultivated in the open air usually flower in August or early September, and bulbs grown cool, in pots or vases, form a welcome decorative feature for autumn use. *L. speciosum* is, of course, a great florist's or market man's flower, and large quantities are annually forced. Amongst the best varieties are *Kræterzeri*, white, with green centre to the segments; *roseum*, *macranthum*, *formosum*, *roseum superbum*; *Melpomene* (crimson purple), *cruentum*, *nanum* (soft rose), and *punctatum* (white spotted pink).

#### *Eryngiums* or Sea Hollies.

One may perhaps also be allowed to put in a plea (if such be needed) for the *Eryngiums*, whose distinct appearance gives a character to any garden. None are so fine in my eyes as the true *E. alpinum*, whose large leaves and wonderfully carved involucre are so pleasing. The involucre of steely blue looks as if made out of feathers or fashioned in the most skilful way out of some lace-work material afterwards starched and stiffened to keep the "creation" erect. Its flowers are thus perhaps the most elaborate of any of the hardy *Eryngiums*. Then there is the lovely *E. Oliverianum*, so finely tinged with blue on the stems as well as about its involucres. More finely coloured still is *E. Oliverianum superbum*: while we have the choice of others of beauty in *E. eelestinum*, *E. planum*, the newer *E. Zabeli*, and others. The last named does not appeal to me so much as either *E. alpinum* or *E. Oliverianum*, the latter being often, by the way, supplied for *E. amethystinum*, which has small heads of flower. These all do well in light soil, like the native *E. maritimum*, the British Sea Holly. These are but some of our July flowers. Space forbids one's indulging in even a summary of the others in bloom. They are plentiful enough and beautiful enough for the highest praise.—S. ARNOTT.

#### *Campanula persicifolia.*

To descend from this glance of the regal Rose, even to a remark or two upon the Bellflowers, may to some seem truly a descent into Avernus, but it is not given to what is known as a "hardy plantsman" to tell of the Rose as she should be described, so that we must pass to her followers in the floral train. In stately spires there rise the flowers of the Peach-leaved Bellflower, one of the noblest of all our *Campanulas*, and one of the most attractive in its varied colours and forms. No one can say that it has not received due attention at the hands of our raisers; for have we not quite a number of forms of more or less superiority to the old *C. persicifolia* of our early days? It seems as if our old Double White, once such a general favourite, were destined to eclipse at the hands of the fine variety known as *Mørheimi*, but when well grown it is not easily surpassed with its symmetrical spike of perfectly formed flowers. To keep it in good condition—in fact, in some gardens, to keep it at all—it is necessary to propagate it by division almost annually. Then, since the introduction of the noble white variety, named *C. p. alba Backhousei* or *grandiflora*, we have had many large-flowered single forms in white and various shades of blue of almost perfect beauty, and of much effect in the garden. These are easily raised from seeds, and a careful selection from among the seedlings will result in a collection of forms of great beauty. Some have single flowers, some semi-double, others have the calyx and corolla coloured alike in blue and white; while some have long and some short-belled blooms. In any almost of its varieties the Peach-leaved Bellflower is one of the best of our summer garden flowers. Its beauty will be my excuse for speaking of it again at this time.—S. F.

#### About the Elm.

It is somewhat difficult to trace the origin of the Elm, but at any rate it is known to exist in North Africa, Siberia, and North and South Europe. There is no doubt, a contemporary remarks, that the Elm has been a common tree in England from very ancient times from the fact noted by Evelyn that in the Domesday Book, which dates from 1068, there are more than forty places bearing the name of this tree, such as Elmhurst, Elmham, and others. Cambridgeshire and Oxfordshire each possess a village named Elm. Elm timber is remarkable for its durability under the action of water, and is therefore in great request for piles to keep up the banks of rivers, and for drainage purposes. The roughness and rigidity of the wood also makes it specially suitable for wheelwrights, who use it in large quantities.

#### *Viburnum Sieboldianum.*

Among valuable shrubs not nearly as well known as they should be, is the *Viburnum Sieboldianum*. In nursery lists it is classed as a shrub; but though usually seen in shrub form, it becomes a small tree under the care of those who desire to have it in that shape. It has very large, rough leaves, of a deep green colour, and because of keeping its foliage green until frosts take it off, it suggests an almost evergreen character. Aside from anything else to recommend it, its vigorous growth and large green leaves, so unlike those of any other shrub, would be good claims to a place on a lawn. In early spring, as soon as a little growth is made, its flowers are produced in large, flat corymbs, white in colour. These flat heads are not unlike those of the *Laurustinus*. Attractive as is its appearance at that time, I think it surpasses it at this season of the year, when its clusters of berries are ripe. These are of a salmon red colour, and with the setting of dark green leaves which they have the effect is very fine. Where birds are numerous the berries disappear soon after they ripen, proving an enticing fruit to them, as so many other berries do.

#### *Clematis recta.*

Not many of us, I think, speak with so little regard for white flowers as a keen lover of plants, formerly M.P. for one of the Scottish counties. He was wont to say of a flower: "It is pretty, but it's a pity that it is white." Most of us will disagree with him in so despising the flowers which are the emblems of purity. They are plentiful, yet never too plentiful in our gardens, and among those which are not sufficiently grown for summer bloom we may include the pretty *Clematis recta*, or *erecta*, as it is more commonly called. No one need suppose that it resembles the popular climbing *Clematis* in its noblest forms, for it is not a climber, but an erect growing herbaceous plant, growing 4ft. or so in height, and bearing clouds of erect small white flowers in almost endless profusion. It is variable, and several varieties are recognised by some botanists. One of the scarcest of these is the double one, *C. recta fl.-pl.*, but the typical one and seedlings raised from it are beautiful enough when grown in a sunny place to give every satisfaction. The plants vary a little, some having broader segments in the flowers than others. It is easily grown from seeds, and it may also be increased by division.—K. D.

#### *Chrysanthemum leucanthemum semi-duplex.*

We have hardy *Marguerites* galore, and between Shasta Daisies, Elaines, Duchesses, and other *Chrysanthemums* with titles of less or no nobility those who wish to choose from these useful summer flowers are bewildered indeed. Yet one is sure that they need not regret selecting as one to cultivate the pretty *Marguerite* known by the uncouth name of *Chrysanthemum leucanthemum semi-duplex*. Last year I came across a garden in which its flowers were being saved for use in a wedding bouquet. I did not see the result, but the fact was enough to tell of the estimation in which this hardy flower was held by one who had a good command of other blossoms from the greenhouse, stove, and open garden. It is lighter and more elegant in every way than even the lightest of the fine varieties of *C. maximum* with fringed margins now so popular in gardens. The ray petals are pure white, the disc is a delicate greenish yellow, and immediately round it are small narrow petals like a lovely fringe. It is not a strong grower like the maximum group, but from a low-growing tuft of leaves the flowers rise on long stalks, which render it all the more useful for cutting purposes. It is not by any means a new flower.—S. A.

*Lilium speciosum* varieties. (See page 104.)

## Societies.

### R.H.S., Scientific Committee, July 21st.

Present: Dr. M. T. Masters, F.R.S. (in the chair); Messrs. Odell, Hudson, Massee, Saunders; Dr. M. C. Cooke, Prof. Boulger; Rev. G. Henslow, Hon. Sec.; and Mr. Hunt, visitor from New Zealand.

*Verbascum leaves diseased.*—Dr. Cooke pronounced the fungus to be *Oidium Balsami*. It also attacks Turnips and Strawberries. Powdered sulphur is the only remedy.

*Gooseberry disease.*—Dr. Cooke reported on samples sent from Cornwall as being attacked by *Miosphaera Grossulariae*. Powdered sulphur is the only treatment.

*Mammillaria with Dodder.*—Prof. Boulger reported that a specimen of *M. Potosina* was attacked by some species of *Cuscuta*. It might have been imported, as hedgerow *Caeti* about Monte Video are commonly covered with Dodder.

*Pollination in orchards.*—Mr. Chittenden, of the County Laboratories, Chelmsford, sent the results of experiments in pollinating Pears and Apples. Of eleven varieties of Pears artificially pollinated (March 3), the flowers being protected by Manila paper bags, Conference and Duroseau set fruit abundantly; Bellissime d'Hiver and Pitmaston set one out of eighteen and twelve flowers respectively, neither having set fruit last year. Of twenty-three varieties of Apples, Gladstone and Stirling Castle were self-fertile, as they also were in 1902. Lord Derby and Schoolmaster, which did not set fruit last year, gave positive results. Of the eleven tried for the first time this year, only King of the Pippins set fruit.

*Carnations failing.*—Mr. Douglas reported on plants sent from Wetherby by Mrs. Duncome "growing in a dry soil." "There was no disease, but the same result ensues from too much or too little water. It occurs when the pot plants have been neglected and a rush of water will then kill the roots. Degenerated plants may be too weak to produce flowers and get into the state similar to those sent. Mortar rubbish, bone-dust, or ground-up oystershells will supply vigour to Carnations."

*Papaver dubium, semi-double.*—Mr. Wilks showed a small plant, about 5 ins. in height, with petaloid stamens. The "doubling" was thus probably due to starvation, a not infrequent cause.

*Conference of New Zealand.*—Mr. Hunt gave some account of the Conference of New Zealand upon fruit growing and horticulture; and a discussion followed upon plants of New Zealand useful for culture in England, in which Canon Ellacombe, Dr. Masters, and others joined.

### National Carnation and Picotee, July 21st.

The whole of the report of the exhibition held on the 21st inst. in Westminster could not be published last week, and the remainder here follows.

#### THIRD DIVISION.

Six Fancies brought out fifteen sets, and some most magnificent flowers were shown. Mr. Cartwright was again ahead with perfect flowers; Mr. Fairlie was somewhat behind as second; third, Mr. W. H. Parton, with a good set. In class 28 for six white-ground Picotees, eleven entered, and Mr. W. E. Wilson, with sweet flowers, was foremost; second, Mr. J. J. Keen. For six yellow-grounds there were thirteen present, and the place of honour fell to Mr. E. H. Buckland, Southgate House, Winchester, with good flowers, but overdressed; second, Mr. Cartwright; and third, Mr. C. A. Philbrick. For three selfs, Mr. Charrington beat Mr. Cartwright out of sixteen lots.

**UNDRESSED BLOOMS. BIZARRES AND FLAKES.**—Mr. E. J. Wootten, of Winchester, was first for six (class 35); Mr. Charrington, second; and H. S. Bartlett, third. Mr. Wootten led for six selfs, with beautiful flowers; Mr. M. V. Charrington, second; and Mrs. E. Beck, third; there being six entries. Six Fancies: Mr. E. Wootten was first; M. V. Charrington, second; and H. S. Bartlett, third, out of seven.

**PICOTEES.**—Mr. Wootten led for six white-ground Picotees; Mr. H. S. Bartlett, second; and Mr. M. V. Charrington, third. For the six yellow-grounds, Mr. Wootten again had the best; M. V. Charrington, second; and Mrs. E. Beck, third. For six selfs, Fancies, or yellow-grounds, Mr. E. Wootten was foremost; M. V. Charrington, second; and H. S. Bartlett, third.

**SINGLE SPECIMENS.**—M. V. Charrington first, with Hildegard; Mrs. E. Beck second, with Cecilia; and Mr. Wootten third, with Frogan. In the novices' class, Mr. J. Parsons was first; Herbert W. Dunlop, second; and Mrs. H. Brodie, Enfield, a really good third.

### Cardiff, July 22nd and 23rd.

Success was again largely written over the fifteenth annual show of the Cardiff and County Horticultural Society held in the Sophia Gardens at Cardiff on the 22nd and 23rd. "A fine show" was the opinion freely expressed on all hands. The schedule this year was enlarged by 100 additional classes, and the entries received fully justified this progressive policy of the committee. Public interest in the show was deepened by the visit of a deputation from the Council of the Royal Horticultural Society, which

consisted of the following gentlemen: Mr. F. C. Lloyd, High Sheriff of Buckinghamshire; Mr. Wigan, son of Sir Frederick Wigan; Rev. W. Wilks, Mr. Veitch, and Mr. Wright. Owing to the trying season, it was generally thought that the quality would be below the usual standard seen at Cardiff, but such was not the case, except in the classes for Roses, Sweet Peas, and outdoor fruits. Exhibitors were put to no little inconvenience through the rain falling in torrents the night preceding and the morning of the show. Happily the weather cleared up during the forenoon, thus relieving the minds of the officials, and ensuring a good attendance of the public, for the flower show is one of the events of the season in Cardiff. The competition was exceptionally keen in all classes except Roses, and no competitor had the proverbial "walk over."

In division A, class 1, open to all, for two stove or greenhouse plants in bloom, and two fine-foliaged or variegated plants or Ferns, James Cypher and Son, of Cheltenham, were placed first with fine specimens of *Ixora salicifolia*, *Statice profusa*, *Croton Chelsoni*, and *Kentia Fosteriana*; W. J. Buckley, Llanelli, being second. For three stove or greenhouse Ferns there were five entries. Mr. Howells, Cardiff, won first prize, in his trio was a splendid specimen of *Asplenium nidus-avis*; Mr. H. R. Farmer, gardener to the Marquis of Bute, came in second. In this lot was a beautiful specimen of *Acrostichum aureum*. For a group of plants to cover a space of 150 square feet, Messrs. James Cypher and Son were again first; Mr. Buckley being second. The two groups were much admired for the exceedingly light arrangement of both. Mr. Neale, Penarth (gardener, J. Davey), won first prize for three Oreohids, his *Epidendrum prismatocarpum* being conspicuous with its lengthy spikes.

In no department of the show were the disastrous effects of the weather more apparent than in the classes for Roses. For twelve distinct kinds, three blooms of each, King's Aere Nurseries, Hereford, won first prize, the best blooms in this stand were Horace Vernet, Captain Hayward, Louise Van Houtte, and Marie Baumann; Mr. J. Crossling, Penarth Nurseries, being a close second. King's Aere Nurseries were again first for twenty-four distinct, staging good blooms of Prince Arthur, Victor Hugo, and Gustave Piganeau. The same firm had the only lot for eighteen Teas or Noisettes, and were awarded first prize, showing amongst others good fresh blooms of The Bride, Bridesmaid, and Rubens. For twelve of any one variety except Teas or Noisettes the Hereford firm staged A. K. Williams; for twelve Teas, one variety, The Bride, being placed first in both classes.

In class 10, for a collection of Roses to occupy a space 6ft. by 3ft., to be shown with their foliage and buds, first prize for which is £3 and R.H.S. silver medal, J. Crossling won first prize. This is the third time in succession that the medal has been won by the Penarth Nursery. In this fine collection Gustave Regis, Victor Hugo, and Mrs. W. J. Grant were shown in good form. S. Treseder, Pwllcock Nurseries, Cardiff, came in second with another fine lot.

For six Carnations and six Picotees there were five entries, first prize being won by W. Tupplin and Son, Newton Abbot; second prize by Mrs. Brooks Smith, Orlig House. When is this crude style of staging the Carnation with white paper collarettes on flat boards to be abolished from our shows? It was a relief to turn to the next class, collection of Carnations and Picotees shown with their own foliage and buds, not dressed in any way, and without ties or bands around calyx or paper collars, space 6ft. by 3ft. A. P. Pike, Llanishen, won first prize with a beautiful lot; W. Treseder second, and Messrs. Blackmore and Langdon third.

Nearly the whole of a large tent was devoted to Sweet Peas, there being numerous entries in each class. For eighteen vases, distinct varieties, Messrs. Jarman and Co., Chard, won first prize, closely followed by Mr. J. Jones, gardener to Sir Thomas Morel, Penarth. For six vases, distinct, Mr. H. Harris, gardener to Mrs. Jenner, Wenvoe Castle, was first; second, J. Jones. Four twelve vases, distinct, the produce of seeds supplied by Mr. R. Sydenham, and for which a large silver medal was awarded with first prize, a smaller with the second, Mr. Harris was again first. This enthusiastic Sweet Pea grower has been hard hit by the weather; though good, his blooms lacked the size and colour of his exhibits at previous shows.

For twelve vases, the prizes for which are given by Henry Eckford, Wem, Mr. Adey, Penarth, staged the first prize lot. This amateur grower had the cleanest and freshest blooms in the show. The varieties, which are fairly representative of those staged in the other classes, were Black Knight, Hon. Mrs. E. Kenyon, Jeannie Gordon, Mars, Sadie Burpee, Emily Eckford, Miss Willmott, Countess of Cadogan, Prima Donna, Lady Grisell Hamilton, Dorothy Eckford, and Hon. F. Bouverie. Mr. Harris was second.

Much interest is taken in the decorative department, especially in the class for a dinner table laid for dessert for eight persons. Miss Ellis won first prize with a light arrangement of pale yellow *Aquilegias* and *Gypsophila elegans*. Miss Crouch was second with a table in which Iceland Poppies were largely used, but were rather overdone. Mrs. Harris was third. The bouquets were below the average seen at Cardiff shows. W. Treseder,

Cardiff, won the silver medal for the highest aggregate in these classes.

In the fruit tent an object of much interest was an arch composed of two pot Vines carrying large, fine bunches of well finished berries, the varieties being Black Hamburg and Madresfield Court. This was exhibited by Mr. H. R. Farmer, gardener to the Marquis of Bute. The mantle of Mr. Pettigrew has evidently fallen on the shoulders of his young successor, for Mr. Farmer is undoubtedly upholding the reputation of the Castle Gardens for pot Vines, indoor fruit, and stove plants. Alongside the arch were eight handsome fruits averaging 5lb. to 6lb. each of the fine new Melon, The Duchess, raised by the late Mr. A. Pettigrew. This Melon, a white fleshed one, and finely netted, has everything to recommend it, the constitution being all that can be desired.

For two bunches any black Grape, Mr. T. G. Cartwright was first with two good bunches of Madresfield Court; Sir A. Henderson second with Black Hamburg. For one bunch, black, Mr. Cartwright was again first; Sir A. Henderson second with Gros Maroc. For one white fleshed Melon, Mr. H. R. Farmer was first with a fine fruit of The Duchess; Mrs. J. Buckley with green flesh, and Sir A. Henderson for scarlet flesh, the latter being a fine fruit of Sutton's Scarlet Queen. Mr. W. L. Bastin was first for a collection of fruit made up of Black Hamburg Grapes, Best of All Melon, Latest of All Strawberries, Pineapple Nectarines, Brown Turkey Figs, and Royal George Peaches. For a dish of Peaches, Mr. Farmer was first with fine fruits of Princess of Wales. For a dish of fifty fruits of Strawberries, Mr. Harris was easily first with a very fine lot of Waterloo.

Nowhere in the show was the competition keener than in the vegetable classes. For the collection of nine varieties, Mr. E. Beckett, gardener to Lord Aldenham, Elstree, was first with perfect samples, well staged made up as follows: New Red Intermediate Carrot, Early Giant Cauliflower, Giant Blood Red Rocca Onion, Pen-y-byd Marrow, Duke of Albany Pea, Snowdrop Potato, Perfection Tomato, Canadian Wonder Bean, and Globe Artichokes. Mr. W. L. Bastin was second. For Sutton's prizes for six varieties the order was reversed, W. L. Bastin being first, E. Beckett second. Mr. Bastin's was a specially fine lot, viz., White Leviathan Onion, Duke of Albany Pea, Perfection Tomato, Magnum Bonum Cauliflower, Favourite Carrot, and Favourite Potato.

In the affiliated societies' competition for the best collection of cut flowers grown in the open, and the best collection of vegetables, the prize for which is a handsome challenge silver bowl, and three guineas in cash, Margam was placed first, the flowers being good, and the vegetables of the highest quality. Llanishen and district were a close second; St. Fagans and district third. The latter had by far the finer collection of flowers, but were very weak in vegetables. In the cottagers' classes the same fierce competition prevailed, vegetables being shown in fine condition.

In connection with the show, the Glamorgan Bee-keepers' Association had a tent well filled with competitions for various kinds of honey, wax, and bee-keeping appliances, while lectures and practical demonstrations of bee driving were given at intervals.

Non-competitive exhibits added greatly to the show. The Marquis of Bute put up a handsome group of stove and greenhouse plants, covering a space of 450 square feet, the stove plants in this massive group being very highly coloured. Mr. James Watson staged a unique group of Cacti; Mr. H. Pettigrew, gardener to Lord Windsor, had a pretty collection of annuals. Messrs. Blackmore and Langdon's exhibit of Begonia blooms was a very bright one, some of the best varieties being R. J. Chamberlain, crimson; Marchioness of Bath, white; Captain Henderson, scarlet; Lady Willmott, red; Mrs. Heathcote, yellow; and Avalanche, white. Messrs. B. R. Davis and Son had a similar exhibit. Mr. John Russell covered 150 sq. feet with ornamental shrubs. Messrs. Hill and Son, Barrowfield Nurseries, delighted Fern lovers with a collection occupying 400 square feet. Kalanchoe flammula stood out prominently in Messrs. Clibran's group. A certificate was awarded to a new Campanula, Hillside Blue, staged by W. J. Stokes and Son. This will be a welcome addition to the herbaceous border. The Ranelagh Nurseries had a pretty group of Asparagus myriocladus.

The numerous awards made by the deputation of the R.H.S. are an index of the high quality seen throughout the show, they are as follows:—

Gold medal to Marquis of Bute (H. Farmer, gardener) for group of stove and greenhouse plants; to Mr. James Watson, Cardiff, for general collection of Cacti; and to Messrs. Hill and Son, Barrowfield Nursery, London, for general collection of Ferns.

Silver-gilt Flora medal to Messrs. Blackmore and Langdon, Bath, for Begonias; to Messrs. J. Cypher and Son, Cheltenham, for group of plants for effect.

Silver Flora medal to Mr. J. Buckley, for group of plants for effect; to Messrs. John Russell and Son, for group of ornamental shrubs; to Mr. W. Treseder, Cardiff, for collection of herbaceous flowers; to the King's Acre Nursery Co., Hereford, for Roses; and to Messrs. B. R. Davis and Sons for Begonias.

Silver Knightian medal to the Marquis of Bute (gardener, H.

Farmer), for Grapes in pot; to Lord Aldenham (gardener, E. Beckett), for vegetables; to Sir A. Henderson, Bart. (gardener, W. Bastin), for vegetables.

Silver Banksian medal to Mr. James Howell (gardener, A. Brown), for Ferns; to Messrs. Crossling and Sons, Penarth, for Roses; to Messrs. Barr and Sons, for hardy flowers; to Mr. Prichard, for hardy flowers; and to Messrs. John Waterer and Sons, for trees and shrubs.

Bronze Flora medal to Messrs. Stokes and Son, for hardy flowers.

Bronze Banksian medal to Sir Thomas Morel, for Sweet Peas; to Messrs. Jarman and Co., for Sweet Peas; to Mr. W. J. Mellings, for six flowering plants; to Mr. J. E. Deacon, for vegetables; to Mr. F. Mears, for vegetables.

Special commendation to Mr. A. Redwood, for vegetables; to Mrs. E. Tiplin, for wild flowers; to Mr. W. J. Mellings, for Pelargoniums; to Mr. C. Howe, for a Pelargonium; to Mrs. Jenner, for Sweet Peas; to Mr. F. Adey, for Sweet Peas; to Mr. J. Nash Leigh, for Begonias; to Mr. A. W. Morris, for bowl of Roses; to Mr. W. Treseder, for bouquet.

The luncheon which followed the opening of the show was presided over by Dr. De Vere Hunt, the genial chairman of the committee. Replying to the toast of the R.H.S., Mr. F. C. Lloyd expressed thanks for the cordial reception and kindness shown to them at Cardiff, and spoke in high terms of the quality of the exhibits in the show. The Rev. W. Wilks, in response to a general request from the tables, also replied. He spoke of the present flourishing condition of the R.H.S., and urged exhibitors to practise the art of staging well; flowers, if possible, should be staged with their own foliage. (Applause). He would carry back to London a cordial report of the kindness met with in Cardiff, and hoped that at no distant date the invitation would be repeated. Mr. Pearson, in replying to the toast of the judges, urged that correct naming of exhibits should be insisted on. Shows lost much of their educational value through carelessness in this respect. Mr. Gillett, the energetic secretary, well deserved the high compliments paid to him, ably assisted as he is by his son Harry, and every credit is due to the committee who have worked so hard for the success of the show.

### Newcastle, July 22nd, 23rd, and 24th

The above exhibition is the oldest in England, and was established in 1824, and perhaps there are few exhibitions which have had so many vicissitudes of fortune as the above show. What with weather and wind, the capricious elements have been hard to contend with; but it has ever had business men at its head of indomitable spirit and gigantic will, which is characteristic of the hardy Novocastrian, who does not recognise the word defeat in his vocabulary. The society is most interested in developing a taste for horticulture in the northern counties, and the present show is beyond doubt one of the best the society has ever had. Many of the chief prizetakers of stove and greenhouse plants were miners, and the cottagers' exhibitions of every class were most meritorious. It is to be hoped this augurs well for the future prosperity of the society. There were several new departures this year in the society's arrangements which were pleasant departures. The exhibits were placed in three large marquees all joined together, so that they were easily accessible to the visitor. The local nurserymen, as well as many of the most prominent of that class in England, were a very great help to the show, and it is a pity perhaps the society or judges did not see their way to award more than one silver medal amongst so many grand collections, as highly, or very highly commended, is not a very satisfactory commendation for nurserymen who have travelled so far and at so much expense, and made the show the success it was. It is worthy of note this year there were many new exhibitors, and the success they achieved it is hoped will be an inducement to them to help the show in future.

For a group of miscellaneous plants, 10ft by 20ft, the society offered £23 and the R.H.S. Silver Banksian Medal. Mr. T. Pattinson, Tunstall Manor, West Hartlepool, was a good first, his arrangement most graceful, and a grand effect obtained; there was sufficient of colour to blend without excess. Crotons, Palms, Begonias, and Verbenas (these were really excellent), Orchids, Gloxinias, and a fine plant of Acalypha Sanderiana were used, dotted over in little hillocks, and the effect was chaste and excellent. The second, Mr. H. Hillier, Darlington, showed also an excellent group which contained many choice Orchids. Mr. F. Edmondson, Newcastle, was third with a group which showed many good points of excellent arrangement, showing every plant to its own advantage. Mr. T. Wilkinson, Newcastle, was fourth, but his group was too flat.

For six plants in bloom, distinct varieties, Mr. J. Ellison, Cramlington, was first, and Mr. S. Bewick, Seaton Delaval, second. As both these gentlemen were miners, their exhibits were much admired and eagerly examined. The former had *Rondeletia speciosa*, *Clerodendron Balfouri*, *Dipladenia amabilis*, *Allamanda Wardleana*, *Stephanotis floribunda*, *Statice profusa*, all fresh and good. The second lot contained *Dipladenia alba* (fine), *Ixora Williamsi*, *Clerodendron Balfouri*. In the open class Orchids were exhibited by Mr. S. Callaghan, who was first with good plants of *Cattleya Mossiae*.

(eight blooms), *Lycaste Deppei*, and *Oncidium crispum*. Gloxinias, *Dracænas*, and *Crotons* were also shown well. Single and double *Begonias* were excellent; the first prizetaker, Mr. J. Hunter, Hexham, who is a schoolmaster, and an amateur all round that promises a future brilliant career. Table plants were an even, finely balanced lot. Mr. H. Hillier received premier award.

**CUT FLOWERS.**—These classes are always interesting to north country men. For thirty-six Roses, twelve varieties, Mr. Hugh Dickson, Belfast, was first. He had an inimitable lot for freshness, size, colour, substance, and possessing every point that the most fastidious rosarian could desire; they were the admiration of visitors, and the following were beautifully staged:—Mrs. J. Laing, Capt. Hayward, Ulrich Brunner, J. Stuart Mill, Etienne Levet, Marie Cochet, Her Majesty, Susanne Marie Rodocanachi, R. Harkness and Co., Hitchin, second. For forty-eight Roses, distinct varieties, twenty-four, twelve, and twelve any sort, and twelve any varieties of Tea Roses, Mr. Dickson was first, with Messrs. Harkness second, except for twelve any variety of Tea Roses, when Mr. R. Park, Bedale, was second.

The herbaceous flowers are always an interesting exhibition at this show, and this year they were a credit to the exhibitors. Mr. F. Edmondson, florist, Newcastle, was first for twenty-four bunches with large bunches of *Delphinium Pysche*, *Scabiosa lutea*, *Aconitum Napellus bicolor*, *Campanula alba*, *Acanthus longifolius*, Iris English and Spanish, *Polemonium Richardsoni*, *Pyrethrum Vivid*, *Lilium auratum*, *Gladiolus The Bride*, *Campanula persicifolia*, *Alströméria aurea*, *Centranthus ruber*, *Gladiolus Crimson Queen*, *Erigeron amethystina*. Mr. Edmondson is an old exhibitor at Newcastle, and his success was much appreciated. Messrs. Harkness were second, also with an excellent lot, and for eighteen bunches, Roses excluded, the latter firm was first. Messrs. G. Gibson and Co., Bedale, were second. These flowers caused much attraction, and were certainly one of the salient features of the exhibition. Show and Fancy Pansies were well represented for the season, as there are many keen growers around Newcastle. Carnations were grand. Messrs. Thompson and Sons, Hexham, were first with Hector McDonald as a special flower and well grown.

**TABLE DECORATIONS.**—These occupied the greater portion of one of the tents, and were, as usual, of a very high-class character, and would have been very difficult to beat. For a vase or epergne for drawing-room, Mr. M. Purvis, Benton, was first with a faultless arrangement of Orchids, Lilies, Roses, Lily of the Valley, all of which were effectively draped with *Adiantum* Ferns, *Asparagus*, and the effect was charming. For a vase for drawing-room, Orchids excluded, Mr. F. Edmondson was first with good flowers proportionately balanced in colour, and each one showing itself without crowding. For a basket of cut flowers, not to exceed 12 in., and for a basket, Orchids excluded, and a basket of Roses, bridal bouquet, hand bouquet, and three sprays for ladies, Messrs. Perkins of Coventry were first in each class. They were all in this well known firm's usual style of good taste, and showing a valuable lesson how flowers can be made effective without using too many of them, by exercising taste and good judgment. The bridal bouquet was a marvellous work of art; *Odontoglossum Alexandræ*, white Roses, Lily of the Valley, and other Lilies were beautifully mingled together, and uniquely draped with *Asparagus*. In these classes the competition was very keen, Messrs. W. J. Battensby, Blaydon, and F. Edmondson exhibiting splendidly, and it must have given the judges some trouble to come to a decision. For a fireplace decoration Miss Edmondson, Newcastle, was first. This class of decoration is becoming very fashionable, and is well worthy of encouragement.

**FRUIT.**—We have seen much better displays of fruit. Many of the Grapes were not ripe, especially the Muscats, but still some excellent examples were staged. For eight dishes of fruit, distinct kinds, Mr. J. C. McPherson, gardener to the Earl of Londesborough, was first with good bunches of Muscat of Alexandria and Black Hamburg, nicely finished; Nectarine Early Rivers, Bellegarde Peaches, Brown Turkey Figs, Royal Sovereign Melon, Queen Pine, and Sir J. Paxton Strawberries. This was an even, nice collection. Mr. J. McIndoe, Hutton Hall, was second with Gros Guillaume Grapes and Black Hamburg, 5 to 6 lb each, and a Best of All Melon. Mr. Wm. Nicholls, gardener to Lady Beaumont, was third, and Mr. E. Combey, gardener to the Earl of Durham, fourth. For four dishes of fruit, including Muscat of Alexandria Grapes, Black Hamburg, Princess of Wales Peaches, and Melon, Mr. E. Combey was first. There were three competitors in this class. For four bunches of Grapes, not less than two varieties, Mr. Wm. Nicholls was first with good bunches of Buckland Sweetwater (very fine) and Black Hamburg. For two bunches of White Muscat, Mr. E. Combey; and for two bunches of white Grapes, any other variety, Mr. J. McIndoe, with Duke of Buccleuch, and the berries very large; and for two bunches of Black Hamburg, and two bunches any variety of black, Mr. J. McIndoe was first, and Mr. Nicholls second with Madresfield Court. For a dish of Peaches, Mr. J. C. McPherson was first with Grosse Mignonne, ripe and finely coloured, and for Nectarines Mr. Nicholls was placed in the same position with Lord Napier. Tomatoes, Strawberries, and Melons were also excellent.

In the division open to all except nurserymen, Mr. J. Hunter was first for four plants, well flowered, including *Clerodendron fallax* and *Balfouri*, *Stephanotis floribunda*, and *Allamanda Wardleana*. Roses, Pansies, Sweet Peas were all good, and herbaceous plants were

excellent, the latter being won by Mr. Wm. —, Kirby Moor side. Some excellent vegetables were also shown, Mr. W. Hodgson Prudhoe, Mr. Wm. Nichols, and Mr. J. C. McPherson being the principal winners. The Royal Horticultural Society's Silver Flora Medal was awarded to Messrs. Perkins, Coventry, for table decorations, and the Royal Horticultural Banksian Medal was won by Mr. Thos. Pattison for his group of plants.

Nurserymen's exhibits not for competition were Messrs. Wm. Fell and Co., Hexham, who showed a splendid group of miscellaneous plants occupying the whole of end of the tent, including choice *Coniferae*, with Palms, Ferns, Hydrangeas, and both gold and silver varieties of the *Acer Negundo*; also the Loganberry, which the firm claim to have first introduced into the North. A Certificate of Merit and a special Silver Medal were awarded to this firm. Having watched their exhibits for nearly a quarter of a century, we must say this was the best group they ever staged at any show.

Messrs. Backhouse and Son, York, exhibited rock and alpine plants as a miniature rock garden, and they were scarcely ever allowed to remain without admiring visitors. They showed also a new *Cupressus argentea alba*. Plants, amongst the rock and alpine, conspicuous were *Silene acaulis* fl. pl. (new), *Lithospermum tinctorum*, *Sarracenia purpurea*, *Darlingtonia californica*, *Podophyllum Emodi*, *Edrassanthus dalmaticus*, *Ramondia pyrenaica*, *Sempervivum atropurpureum*, *Coronilla minima*, *Saxifraga longifolia*, *Potentilla nivalis*, *Hypericum nummularium*. These were the first time here, and the pleasure to visitors was intense. Another interesting exhibit was the hybrid Water Lilies from Mr. A. M. R. Perry, Winchmore Hill, London. These curious plants drew forth much admiration, and were the constant theme of wonder and curiosity to the largest number that perhaps ever visited the above exhibition. The *Nymphæas* included such beautiful varieties as *Andreani*, *Arc-en-ciel*, a new white and salmon variety; *Brakely*, rose; *Frœbelli*, an intense deep crimson with orange stamens, and the different variety *Leydekeri*, including rose; and *filifera*, of a delicate pink or rose colour.

Mr. J. Douglas exhibited Carnations (grand); Mr. J. Thompson, Forest Hill, Newcastle, a miscellaneous collection, including a new *Lobelia* he has raised; Mr. J. J. Barrow, gardener to N. F. Henderson, Esq., Melons; Mr. J. Forbes, Howick, Pentstemons, Verbenas, and Phloxes; Messrs. Laing and Mather, Kelso, Messrs. Mack and Milne, Darlington, and Messrs. Dixon, Ltd., Newcastle, Roses; Messrs. J. W. Barber, Newcastle, cut flowers; Messrs. Kent and Brydon, Carnations; and Messrs. Wm. Cutbush and Son, London, Carnations.

From the above it will be seen how the nurserymen assisted the show.

Messrs. Harriman and Co., Newcastle, had on view vases and fountains; Messrs. W. E. Foggin and Co., Newcastle, wirework; Messrs. Henry Walker and Son and Messrs. J. and H. Harrison, Ltd., both of Newcastle, garden seats.

The staging committee and the executive are to be congratulated on their efforts to make such a splendid treat for the horticultural public, and the secretary, Mr. J. B. Reid, was indefatigable in assisting them. The president, Mr. R. E. Lambton, gave a splendid luncheon in a marquee on the grounds, and was supported by the Mayor, Alderman Sir Wm. Stephenson; chairman, Councillor J. Beattie; vice-chairman, Mr. Pickering; hon. treasurer, John Armorer Batey.—BERNARD COWAN, F.R.H.S.

### Brentwood, July 23rd.

The annual exhibition of this long established society took place in the grounds of Middleton Hall, Brentwood, on July 23, several tents being required to take the exhibits. The Roses were remarkably good, as Brentwood is so near the Rose growing centre. There were very fine specimen Ferns and good examples of ornamental foliaged plants. Fruit and vegetables were highly creditable, and the productions from cottagers were very numerous. A very heavy storm passed over the show ground about noon which completely flooded the tents for a time. Afterwards the weather cleared, and remained fine for the remainder of the day.

In the way of plants groups arranged for effect were a leading feature. The first prize consisting of a silver cup, offered by Miss Willmott, was won by her gardener (Mr. Preece) with an arrangement of a very effective character, and Mr. Preece generously gave the cup back to the society to be offered again next year. Mr. Holloway, gardener to G. H. Baxter, Esq., Hutton Park, was placed second. There was a class also for a smaller group, in which some nice arrangements were staged. A very fine feature in the plant classes was the six exotic Ferns which gained the first prize (Mr. Preece). They consisted of finely developed specimens of *Marattia elegans*, *Microlepia davallioides furcans*, the golden *Gymnogramma Alstoni*, and the silvery *G. Wettenhalliana fijiensis*, and *Adiantum fragrantissimum*. Mr. Holloway came second with a magnificent specimen of *Davallia fijiensis elegans*, fully 6 ft through, a fine piece of the Bird's-nest Fern, &c. Ornamental plants in sizes were also well shown. *Fuchsias*, *Coleus*, *Gloxinias*, *Tuberous Begonias*, *Streptocarpus*, table plants, &c., were also shown.

Cut flowers included hardy herbaceous plants, among which some good things were staged; also hardy annuals, Sweet Peas,

both numerously and well shown, Pelargoniums, Violas, &c. Table decorations made a pretty feature; there were three classes for dinner tables, one in which any flowers could be employed, one for Sweet Peas also, in which some very tasteful tables were set up; and also for wild flowers. The competition was very good among local residents for the prizes. There were also epergnes of Sweet Peas. Cut flowers were also shown by amateurs and cottagers.

A charming Rose show held under the rules of the National Rose Society was a part of the Brentwood display, and some very fine Roses were staged. Messrs. R. Harkness and Co., Rose growers, Hitchin, came first with twenty-four varieties. Some

Two Brentwood and district challenge cups are annually offered for Roses, one in the open division, the other for amateurs. Fate was against both the holders from last year. Messrs. D. Prior and Son and Mr. O. G. Orpen, for had they both won it this year the cups would have become their property. They were won respectively by Messrs. Harkness and Co., Hitchin, and the Rev. J. H. Pemberton.

Two classes for Garden Roses in bunches made a very fine feature. In the nurserymen's class for twelve bunches, Messrs. F. Cant and Co. were placed first with Claire Jacquier (Polyantha), charming little nankeen flowers; Dorothy Perkins, Laurette Messimy, a China with satiny rose and yellow blossoms,

Bothy for six men. (See page 112.)

brilliant H.P.'s, such as Alfred Colomb, Charles Lefebvre, Earl of Dufferin, Marie Baumann, Dupuy Jamain, and others being among them. Messrs. D. Prior and Son, Colchester, were second. With twelve varieties, three blooms of each, Messrs. D. Prior and Son came first; they staged very fine blooms of Maman Cochet and its white variety, Duke of Wellington, Fisher Holmes, Tom Wood, A. K. Williams, Mrs. J. Laing, &c. Messrs. Frank Cant and Co., Colchester, were second also with very good blooms.

Some very fine Teas and Noisettes were staged. Messrs. Frank Cant and Co. were placed first with Mrs. Ed. Mawley, Muriel Grahame, Comtesse de Nadaillac, Bridesmaid, Maman Cochet, and its white form, &c. Messrs. D. Prior and Son came second. In the amateurs' division the Rev. J. H. Pemberton was a leading exhibitor, and secured several first prizes; Mr. O. G. Orpen, of Colchester, was also a leading prizewinner.

Crimson Rambler, Conrad F. Meyer (hybrid Rugosa); Rosette de Legion d'Honneur, Camoens, Gustave Regis, &c. With six bunches the Rev. J. H. Pemberton had very good examples of The Garland (climber), Crimson Rambler, Fabvier, a bright crimson China; Macrantha, Gruss an Teplitz, a bright scarlet H.P.; and Gustave Regis. Mr. O. G. Orpen was second, his three best being Moschata alba, Perle d'Or, and The Garland. The method of staging has much to do with enhancing the beauty of such exhibits.

Some fifteen classes were devoted to hardy flowers, &c., and for Sweet Peas. In these classes some good blooms were staged. There were also tables florally arranged, epergnes, &c. Tables adorned with Sweet Peas were very good.

In the fruit classes Mr. Preece took the first prize for six dishes. He had Black Hamburgh and Muscat of Alexandria

Grapes, Barrington Peaches, Rivers' Orange Nectarine, Figs, and Melon, a very good collection. Mr. W. Green, Harold Wood, was second. With three bunches of black Grapes Mr. W. Green came first with Black Hamburgh. With three of white, Mr. Preece took the first prize with Foster's Seedling. He also had the best dishes of Peaches in Barrington, and of Nectarines in Rivers' Orange. Strawberries, Cherries, and Gooseberries were also shown.

Vegetables were numerous shown, especially by cottagers; The prizes offered by Messrs. Sutton and Sons, Reading, for six kinds brought some good collections. Mr. E. Barker was placed first and Mr. H. Holloway second.

A batch of Verbena, Warley Searlet, were shown by one exhibitor. It was of a bright crimson colour, and a good companion to Miss Willmott. Mr. Leonard Brown, Seven Arches, Brentwood, had a table of Sweet Peas and hardy flowers; Messrs. Paul and Son, Cheshunt, had also bunches of hardy flowers. Mr. O. Chitty, Market Place, Romford, had Sweet Peas and other flowers; so had Mr. J. Russell, nurseryman, Brentwood, and in the open he had a large group of variegated shrubs of an extremely interesting character.

### Huyton and Roby, July 23rd.

This is one of the several fine shows held in the suburbs of Liverpool, and although the atmospheric conditions were not of the best, yet the attendance was good and the quality of the exhibits a distinct advance on former years. The vice-chairman, Mr. T. D. Syers, in declaring the show open, said that residents must look upon the show as more than an event of one afternoon only, and that the show was not the primary object for which the society existed. The primary object was to encourage the cultivation of cottage gardening, and to improve the surroundings of the working classes. That fact had been brought prominently to the attention of many influential persons in the district, who had given special prizes, Lady Derby and Mrs. Parrington having done so for many years with such results that almost every class was firmly contested. The stimulus thus given had caused a piece of ground to be taken into cultivation at Huyton Quarry, and that was a distinct encouragement to the society, because it would employ the working classes, not on the show day only, but all the year round.

The classes for stove and greenhouse plants lacked a trifle in quality as against former years, a newcomer, Mr. J. Hare, gardener to G. H. Nisbett, Esq., Huyton Hey House, taking the lead for four with Croton Queen Victoria, Allamanda Hendersoni, Hydrangea T. Hogg, and Plumbago capensis. He was also successful with exceptionally fine Fuchsias, grand Caladiums, and Palms. Mr. J. George, gardener to T. Henshaw, Esq., Whitfield House, Roby, won with a pretty circular group of plants, the foreground well arranged, but a little deficient in the central mound. Mr. McFall, gardener to Mrs. Harding, Rydal House, Huyton, had a somewhat flat arrangement, but the plants were well distributed.

The double and single Tuberous Begonias and Gloxinias were simply superb in quality and high class culture. Mr. F. Bagnall, gardener to C. F. Boston, Esq., Charlwood, Huyton, and Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby, won, the former in the class for six single, and the latter in the other two classes. Mr. Smith had Ixora Pilgrimi as the best single specimen stove or greenhouse plant, and secured the special prize also. All the Fern classes and single Caladiums went to Mrs. Harding with neat specimens. Mr. Smith's other successes were with Oncidium Lancanum, best single specimen, and a double Begonia. Messrs. Syers and Geddes had two graceful hanging baskets. The best epergne was composed of mauve Sweet Peas and light Grasses from Miss Southall; the bouquet and basket of Roses from Mrs. and Miss Blain. There were seven table decorations, Mrs. Harrison winning with cerise Sweet Peas and Grasses, the green chiffon being edged with Smilax. Miss McCollam second with Iceland Poppies, Ferns, and Grasses; and Miss Fishwick third with Plumbago capensis entirely.

Roses were numerous, but showed the effects of the weather, Mr. J. Burrows taking both classes with Captain Hayward, Mdme. I. Perrier, Duke of Fife, and Prince Arthur, very good. He had the best eight bunches of Sweet Peas; Mrs. Harding for four.

Ixora Williamsi, Bougainvillea glabra, Allamanda Hendersoni, Panceratium fragrans, Bouvardia, and Gloriosa superba were extra choice cut flowers from Mr. McKelvie, gardener to J. Stone, Esq., Blacklow House, Roby. The herbaceous flowers were of the highest character, Mr. T. Henshaw winning handsomely in both classes, also for Carnations or Picotees; Mr. Syers having capital Cactus Dahlias.

Indoor fruit was fully up to the mark, Mr. W. Oldham, gardener to J. Beecham, Esq., J.P., Ewanville, Huyton, had splendid Black Hamburgh Grapes, Royal George Peaches, Violette Hâtive Nectarines, and Royal Sovereign Melon. Mr. J. Stone, for second, had specially good Black Hamburghs and Dagmar Peaches, the latter winning for him the single dish, and Violette Hâtive for Mr. Beecham. Sutton's Empress from Mr. Smith was

the premier Melon. Messrs. Beecham and Stone showed Black Hamburgh and Buckland Sweetwater Grapes, winning in the order named.

Never have vegetables been seen to greater advantage here, Mr. T. Henshaw leading with eight varieties: Ailsa Craig Onions, Walcheren Cauliflowers, Duke of Albany Peas, Model Carrots, splendid Celery, Al Canadian Wonder Beans, Duke of York Potatoes, and Brook's Tomatoes; second, Mrs. Harding. High class Tomatoes secured two prizes for Mr. Smith.

Cottagers' exhibits were excellent, Mr. Young, of West Derby, who is our pioneer in Carnation raising, staged a brilliant lot of flowers. The new seedlings, which are distinct and of great substance, were H. Middlehurst, a rich yellow ground Fancy; Miss Milly Fishlock, a charming pure white of fine form, grand in every way; Lord Kitchener, a deep venetian red; and Miss Lily Babcock, a superb pure white. Mr. Middlehurst sent a large collection of Sweet Peas; Messrs. Caldwell, Knutsford, miscellaneous cut flowers; and Mr. Roby, New Brighton, fine seedling Begonias. Lady Derby's prize went to Mr. G. Roscoe, and Mrs. Parrington's to Mr. R. Wall. Mr. Middlehurst, as secretary, was well to the fore.—R. P. R.

### Southern Counties Carnation, July 24th.

On the Royal Pier at Southampton the sixth annual show was held on July 24, and was a distinct success. The blooms were of good quality, if not more numerous than in some seasons past. The Carnations were supplemented with a capital display of Sweet Peas, which aided in relieving the somewhat monotonous lines of formally dressed Carnation blooms. Mr. Garton, the hon. secretary, had all the arrangements well in hand.

CARNATIONS: Flakes and Bizarres.—For twelve dissimilar blooms four competed. Mr. F. Wellesley, Woking, secured the leading award with typical examples of John Beswick, Gordon Lewis, J. D. Hextall, Master Fred, Mrs. T. Lord, Sportsman, George Melville, Sport, John Wormald, J. W. Bentley, J. S. Hedderley, Mrs. Rowan, and Robert Houlgrave. Messrs. Thomson and Son, Spark Hill Nurseries, Birmingham were second; Messrs. Pembroke and Son, Walsall, third, both staging capitally.

For six distinct, Mr. J. Fairlie, Elmside, Avenue Road, Acton, was an easy first prizetaker with blooms of good quality of the undermentioned varieties: J. S. Hedderley, William Skirving, R. Houlgrave, Gordon Lewis, Mrs. Rowan, and Sportsman. Mr. J. J. Keene, Avenue Road, Southampton, was second with a set but little behind the first prize stand. Mr. D. Walker, Kay Park, Kilmarnock, third; seven competing.

White Ground Picotees.—For twelve dissimilar varieties five staged, making an imposing display. Messrs. Pemberton annexed the premier award with really fine examples of Lady Louise, Lavinia, W. K. Johnstone, Ganymede, Brunette, Favourite, Pride of Leyton, Amy Robsart, Thomas William, Fortrose, Little Phil, and Mrs. Payne. Messrs. Thomson and Wellesley followed in the order of their names. Eight staged in the class for six blooms, distinct, Mr. J. Fairlie winning with Favourite, Pride of Leyton, Mrs. Sharp, Amy Robsart, Fortrose, and Brunette. Mr. J. J. Keene second.

Yellow Ground Picotees.—Against six competitors for twelve distinct, Mr. Blick, gardener to Martin J. Smith, Esq., Hayes, Kent, secured the leading place with characteristic examples of Canteloupe, Isolt, and Mrs. Fox Pitt, for instance; Mr. F. Wellesley second, with Messrs. Thomson running him closely for second place. In the class for six distinct, no fewer than eleven competed, Mr. J. J. Keene being first with Gronow, Lauzan, Empress, Lady Bristol, Lady St. Oswald, and Gertrude. Mr. W. Spencer, 6, Bexley Villas, Windsor, second; Mr. E. H. Buckland, Southgate House, Winchester, third.

Yellow Ground and Fancy Carnations.—For twelve dissimilar there were seven competitors. Mr. F. Wellesley annexed the premier award with really fine specimens of Monarch, Argosy, Primrose League, Brodrick, Amphion, Mrs. F. Wellesley, Charles Martell, Hidalgo, Muleteer, Gipsy Queen, Perseus, and Ossian. Mr. Blick a close second; Mr. E. J. Wootton, St. Cross Road, Winchester, third. In the class for six, fifteen entered, the premier award falling to Mr. W. H. Parton, jun., King's Heath, Birmingham, with The Gift, Argosy, Galleo, Voltaire, Golden Eagle, and Eldorado; Messrs. W. Spencer and Fairlie second and third in the order their names are here given.

Carnation Selfs.—For twelve distinct, Messrs. Thomson and Son won with Lady Hermione, Mrs. Eric Hambro, Bert, Miss F. Simms, Dick Donovan, Nubian, Her Grace, Bomba, Germania, Britannia, Vivian, and Mrs. J. Douglas; Mr. Blick second, with Mr. Wellesley third. Mr. Neville, gardener to F. W. Flight, Esq., Twyford, Winchester, won for six with Mrs. F. W. Flight, Much the Miller, Seedling, Mrs. Shanton, Ensign, and Lady Jane Gray; Mr. W. H. Parton second.

Single blooms were a strong feature. Mr. F. Wellesley won first prize with J. S. Hedderley as a crimson bizarre, and with Gordon Lewis, as a purple flake, he was equally successful.

PICOTEES.—For any heavy edged red, Mr. J. J. Keene won with John Smith. With Thomas Williams Mr. J. J. Keene won

for a light edged red, and for rose or scarlet edged Mr. Wellesley won with Fortrose. Gertrude won for Mr. J. J. Keene first place for one heavy edged yellow.

The premier Self Carnation was a grand specimen of Sir Bevy from Mr. Parton. Mr. Wellesley had the premier Fancy in Charles Martell. The remainder of the cards were not on when our reporter left the show.

In the dinner table decoration there was centred much interest. With a tastefully arranged table of really good blooms Miss Minnie Snellgrove, Southampton, secured the coveted award; Mr. R. H. Jeffery second. For a bouquet of Carnations Mr. E. Wills, 163, Above Bar, Southampton, won first prize with an exhibit of admirable taste; Mr. E. C. Goble, Ryde, second. For a vase of Carnations or Picotees, Mr. E. H. Buckland won; Messrs. Blackmore and Langdon, Bath, second.

**SWEET PEAS.**—For nine distinct varieties, Mr. H. H. Lees, Grosvenor Villa, Portswood, won Messrs. Toogood's first prize with an exceedingly fine exhibit, such varieties as Duke of Westminster, George Gordon, Lady Grisel Hamilton, Lord Rosebery, Miss Willmott, and Black Knight being noteworthy. Mr. A. Maple, Aldermoor, Shirley, second; Mr. T. Hall, gardener to Sir S. Montague, Bart., South Stoneham House, third. The Rev. F. M. Middleton, Old Alresford, won Mr. Breadmore's special prize for nine distinct varieties, with typical examples of Salopian, Miss Willmott, Countess of Lathom, and Sadie Burpee; Mr. Maple second, Mr. Jeffery third, both staging well. Mr. Maple won Mr. R. Sydenham's prize with good produce of popular kinds; Mr. Jeffery second. A Sweet Pea decorated table created much interest. Miss Snellgrove also won Mr. Ladham's prize in this class quite easily with another of her harmonious blendings of colour.

Mr. J. Douglas, Edenside Nurseries, Great Bookham, staged an admirable assortment of leading Carnations, not for competition, which were much admired. Messrs. J. Cutbush and Son, Highgate Nurseries, also added much to the general interest of the show with a similar exhibit, consisting as it did of leading varieties. Messrs. B. Ladhams, Ltd., Shirley Nurseries, Southampton, had a large group of cut hardy border flowers: Gaillardias, Coreopsis Eldorado, &c., were noteworthy. Mr. W. Newton, gardener to W. Garton, Esq., Roselands, Woolston, had a fine group of miscellaneous plants. Mr. C. W. Breadmore, had four dozen bunches Sweet Peas.

### Handsworth, July 24th and 25th.

The energetic committee, with their courteous and efficient treasurer, Councillor W. Roberts, and secretary, Councillor J. Edwards, have much reason to be gratified with the success of the nineteenth annual exhibition of this society, being on the whole the best yet held here. More especially does this apply to the groups of plants arranged for effect, and it may not be invidious to remark that the self-same four contestants fairly eclipsed their recent Wolverhampton demonstrations of a similar character, which is saying a good deal. But upon the present occasion, *mirabile dictu*, the hitherto almost invincible "groupists" from Cheltenham, Messrs. James Cypher and Sons, had to be content with second honours, the first falling to their strong and worthy opponent of recent years, that irrepressible Scot, Mr. J. V. Macdonald, gardener to G. H. Kenrick, Esq., Edgbaston, Birmingham. As a centrepiece he again adopted the usual cork-bark covered bridge, and surmounted with a fine specimen of *Phoenix rupicola*, while the two basements of the bridge were furnished with a rich complement of the elegant and coral red *Fuchsia triphylla*, with its dark green foliage, and for which purpose, grouping, not even the brilliant *Ixoras* can excel. Each of the four corner mounds of the parterre were surmounted with a richly coloured *Codiaeum* (*Croton*) *Warreni*. Several other varieties of the genus, *Ixoras*, *Caladiums*, *Bamboos*, a few *Orchids*, such as *Cattleyas* and *Oncidium flexuosum*, were among the chief plants which lent themselves to make up the well-earned artistic composition.

In equal richness of resources and artistic effect, Messrs. Cypher were a close second, but their centrepiece of tall and finely coloured *Codiaeums*, such as *Reidi* and *Thompsoni*, with other ornamental foliage subjects, was—perhaps unfortunately—topped with a magnificent specimen of *Phoenix Belmoreana*, its dark green massive fronds affording too great a contrast to the bright and rich coloration beneath, and in which a profusion of *Cattleyas gigas*, *Gaskelliana*, and other kinds contributed with great effect. The first prize carries £15 and a silver challenge cup value ten guineas, presented by Councillor T. E. Forsyth, to be won two years in succession, or three times in all, before becoming the absolute property of the winner. Messrs. Cypher having won it twice previously.

In the class for twelve stove or greenhouse plants Messrs. Cypher were well to the fore. A notable specimen of *Stephanotis floribunda* being especially attractive. Mr. W. Vause was placed second, and Mr. Oliver Brasier, of Edgbaston, third, with only moderate examples, the latter not being up to his usual form. An unique and striking feature was the choice and representative collection of *Cacti*, and which deserved a higher recognition than

the certificate of merit. This meritorious exhibit belonged to Mrs. J. G. Thompson, of Handsworth.

Roses, which were very well shown, formed an attractive feature. For twenty-four blooms, distinct, Messrs. Townsend and Son, Worcester, were to the fore, with the proprietors of the King's Acre Nurseries, Hereford, and Messrs. Perkins and Sons, Coventry, respectively second and third positions, the finest bloom in the contest being one of *Horace Vernet*, by the last-named exhibitor. Mr. G. Prince, Oxford, was the remaining exhibitor. For twelve Teas Mr. G. Prince proved victorious; second Messrs. Townsend, and third the King's Acre Nurseries. In the class for twelve bunches of Garden or Decorative Roses, distinct, there were four contestants, the premier prize falling to Mr. G. Prince with an elegant arrangement; second Messrs. Townsend, with a similar effect; and the King's Acre Nurseries came in third.

Collections of *Fuchsias*, *Pelargoniums*, *Caladiums*, and *Coleuses* were fairly well exhibited by local growers.

Floral dinner table decorations presented a highly attractive feature, no less than a "baker's dozen" exhibits filling the centre of a long tent. Mr. Robert Greenfield, jun., Ranelagh Mansions, Leamington, secured the first prize for a richly coloured and elegant arrangement of *Cattleyas*, *Odontoglossums*, and *Francoa*, supplemented with sprays of *Asparagus plumosus*. The second prize fell to Mrs. W. Overton, with a charming and most elegant arrangement of light pink Sweet Peas and sprays of *Selaginella*; it was greatly admired by the visitors. The third prize fell to Mr. N. Harper, nurseryman, Leamington, for an arrangement of Sweet Peas; fourth Mr. S. Rose, gardener to W. S. Vernon, Esq., Handsworth. Sweet Peas were very well staged by several exhibitors, the successful contestants being respectively Mrs. Goode (gardener, Mr. J. Innes), H. Floyd, Esq. (gardener, Mr. C. Brown), and Colonel Wilkinson (gardener, Mr. J. J. Canning).

Carnations and Picotees, though not numerous shown, were eminent for quality. R. C. Cartwright, Esq., King's Norton (gardener, Mr. G. Rudd), annexing the first prize with a superior lot of blooms; second, Mr. A. R. Brown, Handsworth; and third Mr. W. Pemberton, Walsall. In the class for twelve yellow ground or self Carnations or Picotees, distinct; the respective order being maintained in the case of twelve white ground or Self Carnations, distinct, shown as grown.

Fruit formed a rich and attractive feature. For a collection of not less than ten kinds and varieties. First prize, £7, and silver challenge cup, value twenty guineas, presented by the late J. H. Penson, Esq., J.P., to be won two years in succession, or three times in all, Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, was to the front with a large collection, containing nearly forty dishes. It comprised fine and highly finished Black Hamburgs, Madresfield Court, Muscat Hamburgs, three large Melons, Clapps' Favourite Pears, Worcester Pearmain, Lady Sudeley, Beauty of Bath, and Washington Apples, fine Circassian and Black Tartarian Cherries, Keith's Favourite, Czar, and Oullins Early Gage Plums, Latest of All and Royal Sovereign Strawberries, Raymaker, Bellegarde, and Royal George Peaches, Lord Napier and Early Rivers Nectarines, Negro Largo and Brown Turkey Figs, Muscat of Alexandria Grapes, and two dishes of Oranges. The second prize fell to Mr. J. Jones, gardener to Mrs. F. Need, who had an excellent, though not nearly so large a collection as the veteran fruit grower of Elvaston Castle. Mr. Jones' complements were fine Madresfield Court, Muscat of Alexandria, Foster's Seedling, and Gros Maroc Grapes, Crimson Galande and Sea Eagle Peaches, Pineapple Nectarines, Hero of Lockinge and Shamrock III. Melons, the latter a large and finely netted yellow skinned fruit, and a good dish of Oxonian Strawberries.

Grapes were finely represented, more especially the black kinds. For six bunches (three white and three black), first prize £7, with a silver challenge cup value ten guineas, presented by G. H. Johnstone, Esq., to be won three times in all, or two years in succession. The first prize was annexed by Mr. Goodacre with two bunches of Muscat Hamburg, Cannon Hall, and Black Hamburg; second, Mr. W. A. Coates, gardener to Colonel Platt; third, Mr. J. Jones, gardener to Mr. F. Need; and fourth, Mr. R. Grindrod, Hereford.

The local gentlemen's gardeners and amateurs were also most creditably represented in numerous array. Likewise the cottagers. Non-competitive exhibits were in strong force. A silver cup was awarded to Messrs. Hewitt and Co., Solihull, for a fine collection of hardy herbaceous and other flowers. A gold medal was accorded Mr. Greenfield, Leamington, for a fine lot of his *Asparagus myriocladus*, and *Verbena* Miss Wilmott. A silver-gilt medal to Messrs. Dickson, Chester, and silver medals to others, including such as The King's Acre Nurseries, and Mr. W. B. Child, Acocks Green. Twelve certificates of merit were given to Mr. J. B. Grove, Erdington, Messrs. Simpson and Sons, Messrs. Yates, Councillor Mr. Waters, and Mr. J. Boston, Messrs. Austin and Co. and Messrs. Webb and Sons, Stourbridge, for excellent exhibits, chiefly hardy garden flowers.

The show was held in the Victoria Park, and opened by Lady Meysey Thomson, attended by a numerous retinue of ladies and gentlemen.

## Visit to a Market Garden.

Several horticulturists lately made an inspection of the nursery and market garden at Craigmillar, Edinburgh, belonging to Mr. John A. Murie, and were much gratified with what they saw. To begin with, it may be mentioned that the soil is of a light, porous, friable nature, on a gravelly subsoil, naturally well drained. The feeding and manuring of the soil is on a liberal scale, for without continuous applications of the necessary plant food such excellent crops as were examined could not be produced.

On entering the grounds the first crop that attracted attention was a large brake of Cos Lettuce, ready for the market. The plants are so equal that had they been grown in a mould they could not have been more like each other. Leeks were here by hundreds of thousands in all stages, some lately planted, others already a good size having been planted about two months. Parsley is grown extensively, and the brakes of Cauliflowers, Brussels Sprouts, and Cabbage are healthy and vigorous.

We noticed a piece of ground lately cleared of early Turnips which had been cleaned (not dug), marked off in squares; and was in process of being planted with Cauliflowers and Cabbages, the latter grown from seed of Mr. Murie's saving, and a particularly fine strain it was. Early Potatoes are grown, but not so extensively as the green crops above mentioned. It is worthy of notice that the soil is clean and free of weeds, and that it is most liberally treated with fertilising material suited to the various crops. It is gratifying to see so many good vegetables grown within two miles of the centre of Edinburgh. The offices and sheds for packing and conducting the business are commodious; a large well-built house is devoted to the forcing of Rhubarb and the growth of Mushrooms. Mr. Murie accompanied the party and contributed information of a valuable nature to those who had the pleasure of being present.—P. L.

## Plan of a Bothy.

Although two plans of model bothies have been recently published in the Journal, for the sake of diversity if for nothing more, the reproduction of the one herewith given, and one more soon to follow, may be allowed. Readers in general will agree that too many good plans of bothies can hardly be given.

The plan given to-day was one of those contributed in the competition last April, and came from Tekley, Yorkshire. The following letter and particulars accompanied the drawing:—

The chief aim in preparing this design has been to make the general arrangement as simple and economical as possible, and to produce a design which shall meet the domestic requirements necessary for the comfort and accommodation of six gardeners.

The plan consists of a large kitchen, 24ft. 6in. by 14ft. 6in., with small pantry, 6ft. by 4ft., and with large ingle-nook, 12ft. by 3ft., side lighted, and with shelves provided at the side of the range for utensils, &c., whilst cooking. The kitchen has a south-east aspect, being entered on the east side, and lighted from that side by two windows, and at the other end by a mullioned window, which gives light to the sink. The pantry is added as an extra convenience, which can be dispensed with if desired.

A store or extra bedroom, 10ft. by 6ft. 6in., is approached from the kitchen, a corridor 4ft. wide leading to the six bedrooms, and back entrance. In the yard are placed coal place, 9ft. by 6ft.; ashes, 6ft. by 3ft.; and two earth closets, 6ft. by 3ft. These latter outbuildings are roofed with 4in. concrete slabs.

From the kitchen also access is gained to a lavatory, which is provided with three lavatory basins and a bath, which the author of the design considers essential where so many men are concerned, and for this arrangement it has been taken for granted that water is easily obtainable, and therefore the extra amount of cost entailed by the use of piping is not to be considered when compared with the comfort this arrangement affords. The cold supply is laid on to the bath and kitchen sink, but there is no hot supply, so that when hot water is wanted it will be obtained by heating the amount required in the kitchen range, a side boiler being provided for that purpose. Of course, if this arrangement proves to be too expensive, the water piping can be dispensed with and water carried in for domestic purposes.

A level site has been chosen, and this is drained by means of land pipes placed in rows 12ft. apart along the building, the whole of the site then being covered with 4in. rough concrete. Sleeper walls are provided in kitchen as extra support for joists, and proper ventilation to space under floor, as shown on section.

The walls are 14in. stock brick on 9in brick or concrete footings, pebble dashed outside, and two-coat plaster inside. Plinth course being made by a double course of slates. Remaining walls 4½in. thick.

Wooden floors have been used throughout, as the joists, being of small scantlings (1ft. 6in. apart) in short lengths and seconds quality, will not differ so much with concrete in cost, and the

rooms are made much more comfortable by its use, but this is a detail which is easily altered.

The roof is composed of 3½in. by 2in. spars, 9in. by 2in. hip rafters, 7in. by 2in. ridge, 4½in. by 3in. wall plate, 3in. by 2in. ceiling joists, and roof trusses where hips intersect of scantlings 3in. thick, the roof being covered with pantiling.

Doors throughout are plain cross braced batten doors, with the exception of the front door, which is double margin, with flush boarded panels, the two top panels being glass. All skirtings are 5in. by 1in. plain chamfered and moulds, 3in. by 1in. The windows are casement openings outwards, the top light fixed.

Shelves, 18in. by 1in., in store, pantry, and kitchen. A cupboard is arranged over a nest of drawers in the south-west corner of the kitchen (as shown on section). The inside walls are covered with two coats of plaster, with the exception of the coal place and E.C.'s, which are whitewashed. The glass is 21oz. throughout, and 5in. by 4in. zinc gutters and 2½in. fall pipes connected with 4in. earthenware drains are used for the disposal of rain water.

All exposed woodwork is given two coats of paint. The estimates for the various branches of the work I have tabulated on the drawing, and as I have gone as thoroughly into the matter as time will allow, I think the amounts are fairly correct.—INTERESTED AND FRIEND.

## Tubs for Shrubs.

We have the greatest faith in the constructive ability of gardeners, and their faculty to convert various sundry materials to uses as occasions demand. When a tub for a shrub or for plants is necessary, the gardener furnishes, from divers sheds and cellars, the casks and barrels he possesses. He examines them, he chooses the fittest; he cleans, purifies, paints, and adorns them, and in other ways prepares a fitting receptacle for his erstwhile needs.

Ever and anon, however, the true ornamental gardener feels that a more finished article than his limited resources allow him to produce would be better; but failing in his knowledge about where to get the superior article, the old green painted tubs are still requisitioned. It is a pleasure, therefore, to be able to name a firm that has lately

specialised in "tubs for shrubs"—to wit, Messrs. Champion and Co., corner of Old Street and City Road, London, E.C. At their extensive premises one can see all patterns and sizes of the most excellently finished ornamental tubs, made of seasoned oak and teak wood, polished, and slightly varnished, and handsomely coopered with hoops that are either copper or are galvanised, and painted according to order. Numbers of our readers will have

Round Tub.

personal experience of the beauty, substantiality, and utility of such tubs as we allude to. The figures illustrating these notes depict three main forms of tubs such are kept in stock by the firm; but Messrs. Champion make any pattern, if ordered. Thus, should one have an inconvenient, awkward, or unsightly corner in need of a special style of article, what can be done is to sketch the place as it appears, and, along with measurements, send these to Champions for their suggestions and workmanship. The wood employed in making of these tubs is all seven to ten years seasoned. The cheapest and most usually sought for tubs are those of round-form. The four stock sizes are: No. 1, ¾-in wood, 15in high, 18in diameter (top). No. 2, ¾-in wood, 19in high, 22in diameter. No. 3, 1-in wood, 23in high, 26in diameter. No. 4, 1½-in wood, 27in high, 30in diameter. The prices are: No. 1, 15s.; No. 2, 21s.; No. 3, 25s.; No. 4, 32s. 6d.

From the standpoint of usefulness, probably the square tubs rank next. These are made with rounded corners, and look really admirable. The triangular tubs are extremely elegant and useful for a variety of purposes. The greatest novelty, however, are the squares with detachable sides. Such arrangement will be of great assistance to cultivators of Oranges, Bays, Hollies, &c., where these are in tubs, as the soil can be removed from one or more sides at a time, and fresh material added without having to go to such trouble, as well as risk, as is necessary in ordinary fixed tubs. These tubs cost 50s.

The drainage of the tubs is thoroughly good, and rollers can be affixed to the base of each tub if necessary, and this is eminently serviceable for the large sizes. Well made tubs, like these, add immensely to the appearance of forecourts, terraces, halls, corridors, odd corners, and in the garden generally, and they are made to last for generations.

# THE BEE-KEEPER.

## Robbing.

Autumn is the time when the worst kind of robbing is probable, and it therefore behoves the bee-keeper to use every endeavour to prevent it. Novices are often puzzled to know when robbing is in progress in its earliest stages. The method of detecting it is very simple. The robber bee, when it attempts to enter the hive which is being robbed, has an unusual appearance in flight. Its legs apparently hang from behind, and it approaches the entrances with

Triangular Tub.

gradual jerky flights—something like a hawk when it sets its prey—and as soon as it is discovered, or sees its chance of admission closed, it quickly dodges away to a new position to escape the sentinels. A still further confirmation that it is a robber may be obtained by watching the entrance of the hive closely after the entry of the supposed robber bee. An inhabitant of the hive comes out very leisurely and takes wing in the ordinary way, but with the robber the case is different. Its appearance at the entrance of the hive is hurried, and as it no doubt experiences a difficulty in carrying such an abnormally heavy load, it will rise and fall

several times, and finally take its way home with a heavy buzzing flight, often striking objects in its path and falling almost to the ground. The robber bee, on the alighting board when captured and surrounded by enemies, acts in a very singular way. If she is an old one her instinct prompts her to remain perfectly still with her abdomen contracted, suffering the bees to handle her in their own way. She never attempts to retaliate, as that would mean exposing her weak points. The Rev. L. L. Langstroth, the father of American bee-keeping, says—"There is an air of roguery about a thieving bee which to the expert is as characteristic as are the motions of a skilful pickpocket to a policeman."

The method of stopping robbing differs with circumstances. If everything containing honey is made bee-proof, and all entrances to hives are contracted, so that the inmates can better protect themselves, there will be no robbing. There is nothing like prevention, and immediately the season is on the wane the apiarist must be on his guard and reduce all the entrances to hives. Care must be taken not to spill syrup or leave honey in exposed positions. This is the most frequent cause of the evil.

To stop robbing when it is in progress smear the entrance with a few drops of carbolic acid, and if it has not already been done reduce the entrance. The carbolic acid should in this case be put on with a brush or feather, as the skin is injured by contact with it. This will quickly quell the disturbance and restore tranquillity in a short time. If it is ascertained that the robbers come from the same apiary, give them all a dose of smoke at the entrance about every quarter of an hour. This will make them all better tempered and keep them at home.

If the robbing is continued fill a water-can and put on a very fine rose, giving every colony a cold douche at the entrance. This is effectual, but a lot of bees are lost. It is advisable at this season to feed all colonies up simultaneously and manipulate all hives in the evening. There will then be little or no desire to rob.—E. E., Sandbach.

Square Tub.

**TRADE NOTICE.**—Messrs. W. H. Hudson, Chiswick, London, W., desire to state that their seed, bulb, and Japanese Lily business is entirely carried on at 34 to 36, Chiswick High Road, London, W. The local retail shop at 199, High Road, Kilburn, has been disposed of to Mr. Golding, and has now no connection with Messrs. Hudson. All orders by post should in future be addressed to the Chiswick address.

# WORK FOR THE WEEK.

## Fruit Forcing.

**CUCUMBERS.**—Where it is desired to have fruit in the autumn and onward through the winter, seeds may be sown early in August, and the plants being ready for planting early in September, they will, in a light, well-heated structure, with a good bottom heat, give fruit through the autumn months, and not then being overcropped, continue in bearing during the winter, a succession of bearing wood being maintained by cutting out exhausted and training in young for the purpose. The soil for growing them where eelworm has been troublesome should be disinfected either by dry-heating to about 212deg or soaking with boiling water. This acts admirably, so also does mixing the compost with one part in twenty-eight of a mixture of eight parts basic cinder phosphate and three parts double sulphate of potash and magnesia or refined kainit, 1lb of this mixture being added to and thoroughly incorporated by turning two or three times, then left a month or six weeks before using for Cucumbers, turning and mixing well at time of using. This renders the turf mellow and in excellent condition for use.

**VINES IN POTS FOR EARLY FORCING.**—The canes for starting in November, to ripen Grapes in March or April, ought now to have the wood thoroughly ripe and the buds plump. If not, keep the house rather warmer by day, 80deg to 85deg, closing early so as to raise the temperature to 90deg or 95deg, and throw the house open for the night. The foliage must be well exposed to light and as near the glass as possible without touching. Supply water or liquid manure in the case of Vines not inclined to luxuriate in sufficient quantity to prevent foliage becoming limp, but do not give it until the soil is getting dry.

Lateral growths must be kept in check, leaving no more than are absolutely necessary to appropriate any excess of sap, and so prevent the principal buds starting. When sufficiently ripened, as they are when the wood becomes brown and hard, and the eyes are prominent, they should be removed to a position outdoors in the full sun, standing them on slates or boards in front of a south wall, fence, or building, securing the canes to the face of the wall, only giving water to prevent the leaves falling prematurely, and having some waterproof material at hand to throw the water from the pots in case of heavy showers occurring. In this position they will rest, even if the leaves are not actually shed, provided they are not kept too moist. When the leaves turn yellow cut them close to the cane, but without injury to the buds, and shorten the Vines to the length required, or from 6ft to 8ft. Dress all the cuts carefully with styptic or patent knotting. The Vines should be placed in a cool, airy, dry place until required for forcing. Though dryness at the roots is desirable, the soil must not be allowed to become dust-dry, and the pots must be protected from frost by some dry material placed round and over them. It will not, of course, be necessary if frost has not access to the house.

**EARLY FORCED PLANTED-OUT VINES.**—A dry atmosphere is now necessary, not so much to ripen the wood as to induce rest. All the laterals must be kept stopped and the house cool, with moderate dryness at the roots. The inside border may require water, for it is essential that the roots be kept healthy, and the soil not allowed to crack; but if the border has been mulched watering may not be necessary. A moderate extension of the laterals will be sufficient to keep the principal foliage in health. Where the Vines are in an unsatisfactory condition, preparation should be made for lifting, getting fresh loam and clean drainage, so that the work can be quickly done when begun. One part of the border only need be operated upon at once, the inside one year and the outside the next. This prevents loss of crop. The roots should be lifted and laid in fresh soil nearer the surface, whilst there is foliage on the Vines; therefore, work of this nature ought not to be delayed beyond the early part of September, in the case of Vines that ought to be started early in December. The Vines will need pruning by the middle of September, or, when lifted, a little later.

**HOUSES REQUIRED FOR EARLY FORCING.**—Vines that have not been forced early hitherto, and are required for that purpose, will, as soon as the crops are off, need to be thoroughly syringed to cleanse them from dust and pests, applying an insecticide, if necessary, and if there is any doubt about the ripeness of the wood or the plumpness of the buds it will be necessary to keep the house rather close by day, but with sufficient ventilation to cause evaporation and allow the moisture to escape. Give no more water than will prevent the foliage becoming limp. If the weather prove wet and cold, employ fire heat to maintain a temperature of 70deg to 75deg with moderate ventilation, and turn the heat off at night to allow the pipes to cool, increasing the ventilation so as to induce a thorough draught, and this will

soon cause the wood to harden and the buds to plump, insuring rest, which for Vines to be started in December should be complete from the middle to the end of September. When the wood is ripe ventilate fully day and night.

**VINES CLEARED OF GRAPES.**—Through crops hanging after being ripe the Vines often become infested with red spider, and by growing plants in the house they are sometimes attacked by scale and mealy bug, the dry atmosphere also encouraging thrips. Thoroughly cleanse the Vines, fumigate or vaporise on two or three consecutive evenings for the thrips, and repeat in a week or ten days; syringe forcibly two or three times to eject red spider. Mealy bug and scale may be eradicated by syringing with the following solution:—Soft soap  $\frac{1}{2}$  lb, water  $\frac{1}{2}$  gal. Dissolve by boiling, and while hot add  $\frac{1}{4}$  pint of paraffin oil, stirring briskly till emulsified; then dilute to 6 gals with hot water, and when cooled to 135deg apply with a syringe, wetting every part of the Vines. Repeat in the course of four days or a week, and again at a similar interval.

Have the laterals fairly in hand, not closely pinched, unless the Vines are very vigorous and not ripening the wood kindly, when keeping the house rather dry at night, with all the ventilation possible, and somewhat close and warm by day, will promote the ripening of the wood and buds. In stopping vigorous Vines regard must be had to the principal leaves and buds, for when all the growth is removed as made, and the leaves injured, it may cause the pruning buds to start, which must be prevented by allowing a little lateral growth and keeping the soil dry at the roots to the extent of causing the foliage to become a little limp. Weakly Vines may be fed with liquid manure and the laterals allowed to extend, but whatever extension is permitted the extraneous foliage must not in any way interfere with the free access of light and air to the principal leaves, which must be kept healthy, and thus appropriate some of the food and store it in the adjacent wood and buds. Free ventilation will be necessary day and night.

**GRAPES RIPENING.**—Whilst ripening Grapes swell considerably, therefore do not allow any deficiency of moisture in the border. Give, if needed, a good supply of water or liquid manure, and in the early part of the day, so that superfluous moisture may be dissipated before night. Heavily cropped Vines require time and copious supplies of liquid manure, which if it does not help the current crop, will prevent the exhaustion of the Vines. A good rest at night in a temperature of 60deg to 65deg with air is a great aid to Vines taxed to the utmost by weight of Grapes. A moderate amount of air moisture is essential to the health of the Vines, sprinkling the paths and borders occasionally, and, if possible, allow the laterals to extend, but full or over-cropped Vines rarely can cater for more than the principal leaves and Grapes. Admit air constantly, enough with gentle warmth in the hot-water pipes to ensure a circulation, and maintain a temperature by day of 70deg to 75deg, keeping through the day at 80deg to 85deg, or 90deg with sun, and full ventilation.—ST. ALBANS.

### Kitchen Garden.

**CELERY.**—Where previous attention has been given to an early row or two of Celery with a view to having some ready for use shortly, the final earthing ought now to be given. Should the soil be dry first give a liberal soaking of water or liquid manure, or a dressing of artificials may be washed in. Secure the leaves together in an upright position so as to protect the hearts of the plants, and aid also in blanching. Only good, well-grown plants possessing size, substance, and moderate length ought to receive the final earthing at this comparatively early date. If still small and growing well, defer the last earthing for a time, even if this makes the time of obtaining blanched produce later than desirable.

During the course of growth Celery will need several copious waterings, so as to maintain a constant supply of soluble food for the active roots. Clear water is best at first; but after the roots become numerous and ramify well, rapidly absorbing the available food in the soil, liquid fertilisers can, with great advantage, be given. Natural stimulants made from cow manure, fowl, pigeon, or horse dung, are excellent. As a change scot water will be found beneficial. Occasionally supply guano or a general artificial mixture soaked in water and mixed at a safe strength. Although good for the plants liquid manure must be supplied intelligently, not surfeiting the soil or giving it when the latter is in a dry state. Once or twice a week, according to the vigour of the plants, will be found ample.

After the first extended period of active growth Celery usually needs some attention in trimming, removing sucker growths and the small basal leaves and leafstalks, at the same time clearing away weeds. The principal and remaining leafstalks should then be lightly drawn together, and held with ties of raffia grass. The first earthings are then easily carried out.

**SOWING CABBAGE.**—In many districts the main sowing of Cabbage for spring use is best made now, while in others, deferring doing so later will be found to answer. It is not, however, desirable to depend on one sowing only. A later one may be made a week or ten days hence, and plants from both cultivated. Should the soil be very dry, after preparing it and breaking it well down, give a copious watering. Then sow the seed broadcast

thinly, and cover with a thin layer of soil. The varieties most in favour for present sowing are Flower of Spring, Ellam's Dwarf Early, Mein's No. 1, and Wheeler's Imperial.

**FEEDING TOMATOES.**—Tomatoes outdoors, or under glass in pots, boxes, or borders constantly require attention. Having made strong growth, produced fruit freely, and being furnished with a good root system, the demands for moisture are imperative and must not be neglected or the swelling of the fruit, already set, will be arrested, and further bunches of flowers prevented setting. It is, in the first place, highly important that the soil moisture about the roots be fully maintained. This forms a good foundation for any stimulants which it will be necessary to give as a means of supplying nutriment. Various solutions made by soaking different manures, such as cow, horse, fowl, at the rate of a peck to 30 gals of water can be given at frequent intervals. Plants with the roots confined will require it most. The outdoor plants may be provided with a mulch of manure over the roots, this serving to prevent rapid drying up, and promotes the production of rootlets. Also under glass a mulching serves the same useful purpose, after one or two top-dressings of soil have been added.

**PEAS AND BEANS.**—Rows of Peas for a late crop and Scarlet Runner Beans need moisture at the roots to enable the flowers to set well. To facilitate the application of water and liquid manure, and also to prevent rapid evaporation of moisture, lay down a mulching of manure on each side of the rows.

**TURNIPS.**—Turnips sown now will, if the ground is fairly moist, germinate and grow away more freely than hitherto. A spell of hot weather, however, coming just as the seedlings push through, an attack of Turnip fly often carries them off. The best course to follow is to sow a little stimulating mixture in the drills at the time of sowing to enable the plants to push rapidly along after germination. Equal parts of salt and guano, about 2 lb of each to a square rod of ground, sown in the drills, is excellent. Superphosphate also scattered along the drills is a good stimulant. The seed must not be sown thickly, so that the plants may start strongly from the first. Thin the seedlings as early as possible, and keep the hoe at work when possible; also giving light dustings of soot.—EAST KENT.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**MUSCAT GRAPES SHANKING AND SHRIVELLING IN THE STALKS (J. T.).**—The Grapes are affected by shanking, one of the most perplexing maladies that affect Grapes, and still remains the most obscure. It has been attributed to over-cropping, thus overstraining the powers of the Vine, but over-burdened Vines may not show signs of shrinking, the berries being only defective in colour. Destruction of foliage by red spider or scorching is another assumed cause, yet the scarcity of leaves or elaborating power does not always result in shanking. Chills or sudden changes of temperature is another of the suggestions leading up to shanking, but there may be rusted Grapes yet no shanking. Excessive dryness at the roots has also been saddled with shanking, but our experience is the opposite. The real cause in our practice has proved to be that of the roots getting into a cold subsoil, or the border becoming sodden and sour, whereby the young rootlets are destroyed, or the food supplied of a corrosive nature. This may be accelerated or even produced by excessive supplies of water or too abundant applications of liquid manure. Planting in borders composed of too close or too rich materials is a common cause of shanking, as the food elements are too crude and not sufficiently nitrified, and the roots, though sometimes plentiful, are very soft and spongy, often perishing in wet periods. Indeed, we regard an unfavourable rooting medium and a sodden and sour soil as the real cause of shanking. In this we are justified by the fact where the roots are at fault, as they usually are, either through being in a border which is too rich and close, or too wet and sour, the only remedy that can be adopted is to take the Vines up carefully and renew the border, taking care to introduce a greater proportion of porous materials than before, providing good drainage with underdrains, to carry off superfluous water, these having proper fall and outlet, and then replant the Vines, keeping the roots well up to the surface. The recent heavy rains would no doubt further the shanking, but

it shows the soil to be non-porous, hence too wet, and the components solved sour. By renewing the inside border one year, and the outside another, the Vines may be lifted and the border renovated without loss of crop.

**RHODODENDRONS, A SELECTION (W. H.).**—Rhododendrons do not necessarily require a peaty soil, but they prefer it, and do well in it. Any good loamy soil suits them. They do not thrive without much care in mulching and watering in a sandy soil. They refuse to grow in a soil containing lime. The peat you send a sample of is good; it is sweet, fibrous, and not too spongy. This, incorporated with your garden soil will do admirably. The following are varieties such as will give you satisfaction; and they can be obtained from John Waterer and Son, American Nursery, Bagshot: Lady Eleanor Cathcart, Mrs. Tom Agnew, Jno. Waterer, Kate Waterer, Mum, Gomer Waterer, Sappho, B. W. Elliott, Chionoides, Delicatissimum, James Mason, John Walter, Madame Carvalho, Minnie, Mrs. Jno. Penn, Princes Hortense, and Princess Mary of Cambridge.

**TOMATO PLANT DISEASED (A. W. R.).**—The plant we found on careful examination microscopically to be infested with the parasitic fungus known as *Macrosporium Tomato*, syn. *M. lycopersici*, which causes the disease called "black stripe." It appears to be present wherever the Tomato is cultivated. The fruit is most frequently attacked, but the fungus is also often present, as in your case, on the leaves and stems. It is a near ally of, if not identical with, Potato leaf curl fungus, *Macrosporium solani*, which affects the stems, leaves, and "apples" of the Potato in a similar manner to the fruit of the Tomato, indeed, we cannot discover any distinctive feature, only what may be due to host-plant influence. Black stripe certainly is one of the worst fungoid diseases affecting the Tomato. The leaves of the plant first curl, and at this stage there is usually no external signs of the fungus, but presently brownish streaks or stripes appear on the stem, the petioles of the leaves, and the leaves themselves become blotched, and the fruit also is affected, usually at "eye" or style end where the floral organs have been, or at the heel or point of insertion of the stem, though the stripes or blotches may appear on any part of the fruit. According to some cultivators the disease originates in the soil, others attribute it to the seed, and fungologists regard the fungus as a wound-parasite. One thing is certain; the disease is propagated by spores, and the mycelium runs throughout the stem of the growing plant, without apparently doing any injury until it reaches the soft young growth; here a shrinkage is caused, also discoloration of portions of the stem and foliage and fruit, which become visibly affected with dark brown or black stripes and blotches, and in bad cases, not infrequently, the upper part of the plant collapses altogether or the crop is ruined. This appears the exact condition of your plant. It was quite sound in the root-stem and roots, even the stem above ground was not affected in the tissues only where the black stripe appeared, and a similar remark applied to the leaves and fruit. If, therefore, the disease originated in the soil, or even in the seed, it left no trace microscopically, the symbiosis being complete and indiscernible even by the microscope. This is not remarkable, for even in the case of Tomato leaf rust (*Cladosporium fulvum*), and also in that of sleeping disease (*Fusarium lycopersici*), the disease may be present without visible sign or even when examined microscopically; nevertheless, it is well known that seed obtained from such plants produce diseased seedlings. On the other hand, sound seeds saved from fruits affected with black stripe, blotch, or rot, do not become affected with that disease, or even with "leaf rust," often confounded with black stripe from its also causing brown stripes on the stems and blotches on the fruit, and also with sleeping disease. This favours the fungologists' point of view, viz., that black stripe is a wound parasite, attack being due to minute cracks in the cuticular tissues or softened parts of the cuticle from moisture resting on particular parts, such as round the style, or at the point of insertion of the stem of the fruit. The data means culturally that Tomato houses are kept much too close and moist, that they have not enough air, and the atmosphere not buoyant so as to prevent the deposition of moisture on fruit. Indeed, it implies a freely ventilated atmosphere, all the light possible, and moisture kept from the fruit and stems, not allowing the faded floral organs to remain after fertilisation is effected. Checks of all kinds, such as forcing treatment at one time by keeping relatively close and moist, and at another inducing stuntedness by excessive ventilation and sudden drying of the atmosphere on a recurrence of bright weather after a dull period, must be carefully avoided, also the use of green stable manure, either as a mulch or on the soil, as this is considered to favour the disease, and also causes the fruit to crack, thus rendering it susceptible in a high degree. Instead of a manure calculated to induce a gross habit of plant, a mixture of 2½ parts superphosphate, 2 parts sulphate of ammonia, and 1 part muriate of potash, well mixed, and 3oz applied per square yard as a top-dressing; or as a liquid manure, 1oz per gallon of water. This certainly fortifies the plant against disease, and favours the crop without inducing over-luxuriance. We do not see what you can do more to repress the disease than destroying plants by fire as soon as they show signs of it, and spraying with potassium sulphide solution. Sterilisation of the soil is advised for this disease, but the heat

must not exceed 180deg or 212deg, the former being safe, or the nitrifying micro-organism would be prejudiced, but if the disease goes over in the seed, as we suspect in many instances, it is all-important to destroy the disease plasma thereon or attached, which would probably be effected by steeping the seed before sowing in water at a temperature of 130deg to 135deg for five minutes, but on this point we have no definite data, and it would be well to ascertain this by experiment, so as not to destroy the vitality of the seed.

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (T. G. T.).—*Sinningia tubiflora* Fritsch (syn. *Gloxinia tubiflora*, Hook. in "Bot. Mag." t. 3971.) (R. A. C.).—1. *Verbascum nigrum*; 2. *Lysimachia vulgaris*; see also next week.

## Preparing Land for Wheat.

Although more than two months must pass before the drilling and sowing of Wheat will commence, it is not too soon to begin preparation of the soil for the reception of the seed, and in certain contingencies it is highly desirable that no time be lost in setting about that preparation. A large though decreasing portion of our British Wheat crop is still grown after seeds under the old four-course system or modifications of it, and it is the preparation of this seed land which has a very great bearing on the success or failure of the crop. At one time Wheat was the most important crop on the farm, in fact the mainstay of the farmer in paying his rent and making a profit. In those days everything else was subordinated to the welfare of the Wheat, and it was quite a common thing to see large areas of sheep pasture ploughed up before harvest, so that the green sod could become decayed and the land properly solidified before it was time for the sower to go his round.

Wheat has not changed its character since then, and still delights in a firm rooting medium, whilst showing its dislike to green, grassy sod about its roots; and in seasons like the present one, when pastures have run away from the sheep and present almost the appearance of unmown hayfields, it is especially necessary to put in the plough early if the field is to be sown with Wheat. Wireworm is the great enemy of the young Wheat plant, and wireworm is invariably most numerous on land which has been allowed to grow tall vegetation, for the insect seeks such whereon to lay its eggs. If, therefore, we have a field of seeds which we wish to sow with Wheat, and which is full of long herbage, the sooner we start ploughing or using the cultivator the better. But, perhaps, we want the pasture for the sheep for a longer period! Well, there is the rub! Sheep are more important now than Wheat, and farmers make more use of their seeds.

Seeds are now very frequently kept down for two or three years, and if Wheat is to follow them with any chance of success it is imperative that the land be broken up with a cultivator before harvest, and the sod be well broken up. After harvest another cultivation, followed immediately by a thorough ploughing, will give the Wheat as good a chance as otherwise it might have a poor one.

Two and three year old seeds are invariably infested with wireworm, for there have been so many opportunities for the insect to deposit its eggs; but long, overgrown young seed pastures are often equally as bad and need the same treatment. It must be borne in mind that the early breaking up of seeds does not necessarily destroy the wireworm, but there is no doubt that it very greatly checks its activity and minimises its power for harm. Therefore, if we can spare our seeds and wish to have a full crop of Wheat we had better put in the plough or cultivator at once. For one-year seeds ploughing should be sufficient, for even if the herbage be rather tall it can be well buried in the furrow if a skim coulter be used effectively. For two or more year old seeds we strongly recommend the use of the cultivator, for there are other enemies to be found there as well as wireworms. Few pieces of old seeds are there which have not accumulated a certain, and too often an inconvenient amount of twitch, and it is highly desirable if Wheat is the intended crop that this twitch should have a good deal of the life knocked out of it before the Wheat is sown.

If the twitch be not scotched an attack of wireworm, thinning the Wheat plant, will give the twitch an opportunity which it is always ready to take, and when hoeing time comes the plough and not the hoe may be the implement needed.

If manure be plentiful and the Wheat crop considered important enough to have a dressing, it must be ploughed in with seeds, but on the majority of farms where the Wheat is still considered worthy of manuring, the fertiliser is applied early in the previous spring so as to benefit the pasturage as well as the following white crop. Of course, if this has been done, another dressing now would be sheer extravagance. If manure be spread on just before the plough it must be very well shaken out or broken up, or the difficulty of making a clean and thorough job will be materially increased, especially if the herbage be rank. The old type of plough is the best for ploughing lea, and on no account must the American chilled ploughs or diggers be used—they leave the land much too corky and light. If we do not plough with the old ploughs we had better use the cultivator and break up the surface, thoroughly leaving the disintegrated sod and twitch to the influence of sun and wind until the approach of seed time makes ploughing necessary.

Early ploughing not only gives the turf time to decay, but also gives the land a chance to attain that solidity which is so necessary to the formation of good and numerous roots. When lea is ploughed soon after midsummer it is not imperative to use the press or Cambridge rolls, as is the case when we are approaching Michaelmas; but it is advisable, nevertheless, and at this season we never have to wait long for an opportunity.

There is another reason for early ploughing this season in addition to the fact that we can spare the pasturage. The land is now in a moist condition for the time of year, and the ploughing could be well and easily done. With a dry August ploughing might be difficult or impossible in September. There is another point, viz., the depth we should plough. Not less than 5in we think. Land with less than 5in of soil is not suitable for Wheat.

## Work on the Home Farm.

Barley is beginning to assume a tinge of gold, in fact we saw a field of winter Barley yesterday looking quite yellow. This makes farmers prepare for harvest, and we notice many reapers passing to the machine works, which we are fortunate to have close at hand. The proprietor of these works keeps a number of binders which he lets for hire. After harvest he has them all repaired, cleaned, and packed away, and he tries hard to induce farmers of the neighbourhood to do the same; but they prefer to keep them dirty and out of repair until the corn is nearly ripe, and then grumble when they cannot have the repairs done at a moment's notice. Such is human nature!

The week has been fine with a few heavy showers which have hindered belated haymakers, but have been grand for the roots. Turnip hoeing and cleaning is still the chief item of work, and such progress is being made as justifies us in the expectation that the Corn harvest will not find us unprepared for it. Certainly Turnip hoeing will be finished.

We hear of a commencement to market second early Potatoes, but the attempt was not encouraging. The tubers are small, and the weight per acre quite inadequate to give a paying return.

We see traction engines drawing small trains of road material into every parish. At one time the farmers did this work. Now the tenders asked for by the rural councils are all offered and filled by steam traction contractors. Horse power cannot compete with them, and the farmers have to pay instead of receiving; but the poor horses get a well earned rest at a time when they used to be carting heavy loads of stone, so the loss is not a clear one.

Wool is up again, and we hear of 17s. per tod being given. There is a great deal yet in farmers' hands, and we are glad they have succeeded in holding to good purpose.

There are many more store pigs offering than there has been for a long time, and we are evidently to have lower prices for a time. If, as seems likely, we have a scarcity of Potatoes and dearer Corn, there must be a slump in the pig trade.

Sheep are very healthy. We have weaned our lambs, and have them on the old pastures, which are full of good sound meat. We let the lambs have as much medicated lamb food as they will eat, which is nearly 3lb per head per day.

**Journal of Horticulture.**

THURSDAY, AUGUST 6, 1903.

**Judges under Judgment.**

HE referee at football, the umpire  
 at cricket, and the judge at a  
 flower show, are all persons who  
 naturally expect to come in for  
 a fair share of criticism, both  
 from the persons most interested,  
 and also from the partisan on-  
 lookers. They are all expected to  
 be absolutely infallible, and if they  
 should happen to make a mistake, it is either  
 put down to their total incapacity to act as a  
 judge, or else to a deliberate act of gross  
 favouritism. Concerning flower show judges a  
 letter of complaint appeared in this journal  
 some time ago having reference to persons who  
 act as judges, and even tout round for engage-  
 ments, but have no qualifications at all for the  
 office. There might have been some ground  
 for the complaint, perhaps there was, but with  
 the exception of large shows judging fees are  
 not plentiful nor high enough for men to seek  
 engagements. On the other hand, it is gene-  
 rally a case of men acting as judges purely to  
 oblige the society that invites them, and it is  
 for the committee of the latter to ascertain  
 beforehand whether the persons who are asked  
 to adjudicate are capable men or not.

Generally, I think a man's qualifications to  
 act as a judge are gauged by the position he  
 holds. For instance, there is a Mr. So-and-so,  
 head gardener at a certain pretentious  
 establishment; he is simply bombarded with  
 invitations to judge at local flower shows, not  
 because much is known about his adjudicating  
 capacities, but because his position is accepted  
 as a guarantee of the above. And sometimes  
 Mr. Head Gardener at the big place gets a  
 little puffed up by the compliments paid to  
 him, and wants to do the judging himself while  
 his one or two colleagues look on, or just drop  
 the cards on the exhibits at the great man's  
 suggestions. Of all things, save me from

(SUFFICIENT ADDRESSES).

LONDON N.E.

judging with the man who wants to have things all his own way, and tells you that "we must go there for first" and "come here for second" without stopping to consider whether you have an opinion at all. Just note his look of withering scorn if you happen to disagree with one of his ready-made decisions, and if, when he has taken the trouble to point out your ignorance to his own satisfaction, you still remain unconvinced and will not give way, then his scorn gives way to an expression of profound pity, both for you and also the misguided society that asked you to judge along with such a person as himself.

A much more amiable person, but still not an ideal judge, is the individual who really has no settled opinion of his own, but is possessed with an overwhelming anxiety to please everybody. Of course he doesn't succeed; but as a rule he does no great amount of harm, and when asked to take the initiative in making an award to a plate of Potatoes he coughs and hesitates, strokes his chin, turns over the tubers again and again, bends over the table and looks closely at them, then surveys them at a distance, and comes eventually to the conclusion that he is rather in favour of this dish, but of course if his colleagues prefer any other for the first prize he is quite prepared to give way. This is the kind of man who shines better at the luncheon than at the actual judging. He is possessed of a nice little set speech, which he delivers on all occasions in the same amiable way, and tells the officials what a splendid show it is, how excellent the arrangements are, how honoured he feels at being privileged to officiate under such circumstances, how pleased he shall be to come again, and so on, and so on. Taken altogether, he is a nice sort of fellow, is the ultra-amiable judge, and when quite relieved about the right thing being done in all instances, he walks round the show and receives the congratulations of the prizewinning exhibitors with the full satisfaction of a man who has fearlessly done his duty.

On one occasion I remember having a colleague of this type, and from the outset to the finish we got on swimmingly together, but when it was all over and my friend was looking round the tent, an unforeseen incident occurred. As is usual on such occasions, one exhibitor was dissatisfied with a decision we had made, and when he buttonholed the amiable judge and pointed out what he considered to be an injustice to himself, in language more forcible than elegant, I happened to be on the outside, and there was only a thin wall of canvas between us. Consequently I overheard the remarks of my colleague, which were something to this effect: "Yes, yes, quite so; I see; you're right; that was my contention all along, and you would have had the prize if it hadn't been for that other fellow." I didn't stop to hear any more as my train was due.

It is an open question whether there should be two or three opinions in making the awards at shows. As a rule, a couple of judges for any one division is sufficient, in spite of the contention that three heads may be better than two, and a good deal of time is saved that otherwise is spent in useless argument. I have no objection to acting with two others, so long as I am on fairly good terms with one of them, but if the other two are in coalition then you are the odd man out, so to speak, and the actual part you play in making the awards does not amount to very much. It is true that two judges may fail to agree, but the difficulty is easily overcome by calling in a third opinion to settle the point; that is to say, if the third party's decision is accepted without comment. If, however, you happen to be the third party, and each of the disputing judges, instead of waiting for your opinion, commences by argument to prove that he is right, then things are not altogether so easy, especially if the man whom you eventually disagree with twits you on your ignorance afterwards.

In spite of the judging rules formulated by the Royal Horticultural Society, and the reams of copy that have been written on the subject, the question of size v. quality in show vegetables remains unsettled, and exhibitors are often non-plussed in consequence. There are judges, however, who have settled the matter for themselves, and when a man glances at the schedule and observes, "This is a cottager's class, we must consider size," you may depend that if he has his own way the prize cards will fall on the biggest specimens on the board. By another rule, the same individual has his own idea as to what is best for a gentleman's table, and when adjudicating in the professional division it is the smallest produce that finds favour with him. In the way of judges, exhibitors sometimes pride

themselves on knowing their men; and once when I remonstrated with a man for boarding some large coarse vegetables, he gave me a knowing wink and observed, "I know my men, you see the judges go for size here." As it happened, however, the judges were changed on that occasion, likewise the opinions, and the exhibitor who knew all about it was intensely disgusted to find himself thrown out entirely.

There is a good deal of character displayed at a flower show, particularly when the judges are being judged after the awards are all made. You are probably acquainted with the man who never exhibits, nor ever grew anything worth exhibiting, but still he always goes round to see if the judges have done the right thing, and if he is able to congratulate them on this in all cases they may consider themselves as being perfectly competent. Again, there is the man who is never satisfied unless he gets a prize for everything he shows, and is prepared to raise an objection against a fellow exhibitor for staging twenty-nine Gooseberries when he ought to have thirty on his plate. Over the bar in the refreshment booth this man disperses judgment on the judges pretty severely, and as he passes out of the show at night with a rejected member of the Cucurbita family under his arm, observes in a disgusted tone, "Marrer! what do they know about a Marrer?" and you have his candid opinion of the judges on that occasion.

Still the flower shows continue, and the judging is performed next year much about in the old way. Dissatisfied spirits sometimes drop out, but as a rule they forget their grievances and come up smiling at the next show, when the decisions of the judges are judged over again. In the meantime articles are written describing right and wrong ways, and the usual paragraphs appear enlarging upon the incapacity of judges, though none of the latter take them in a personal sense, so they do neither good nor harm. Judges do not seem to alter much, and as a body act honestly and according to their lights, and if they go home quite unconscious of the kind and unkind things said about them by those who claim the privilege of sitting in private judgment over their decisions, it is just as well for their peace of mind that it is so.—JUDEX.

## Testing Seeds.

Seeds may fail to germinate from a variety of causes, even when exposed to the proper degree of warmth, moisture, and oxygen. They may be too old, they may not have been sufficiently mature when gathered, they may have become too dry, they may have been subjected to freezing before sufficiently dry, they may have been stored when damp and thus subjected to undue heating, or they may have been damaged by insects or fungi either before or after maturity. It is unnecessary to plant seeds in soil to test them, since the seed tester is much more convenient. This useful device consists of two circular pieces of clean, moderately thick cloth of rather loose texture, a table plate that is not warped, and a pane of glass large enough to cover the plate. The cloths are dipped in water and squeezed a few times while under the water to press out the air. They are then wrung out until moderately wet, spread over the bottom of the plate, and the seeds to be tested are placed between them. It is well to use a hundred or more seeds of each sample, as a larger number will show the per cent. of vitality more accurately than a smaller one, and the lot should always be well mixed before taking the sample. The plate should be kept covered with the glass to prevent evaporation from the cloths, and it may be placed in any room of comfortable living temperature. The seeds should be frequently examined, and may be removed as they sprout, when by subtracting the number that fail to sprout from the number put in, the percentage of vitality may be readily computed. The cloths should be placed in boiling water a few minutes before using them for a second test to destroy any spores.

## Attar of Roses.

The increasing prosperity of the attar of Rose industry is shown by the fact that in eight years the area under cultivation has nearly doubled, having reached the figure of 13,700 acres. Last year's crop was expected to be one of the largest on record, but a week of scorching winds reduced the yield by a quarter. The damage done to the quality of the Roses is shown by the fact that 360lb of flowers were required to produce one ounce of attar, or twice the usual quantity. The yield totalled about 75,000oz, as compared with 135,000oz in 1900. Last year's crop is estimated at 25,000,000lb of Rose flowers.

### *Cypripedium leucorrhodum.*

This is one of the many hybrids of Messrs. James Veitch and Sons, of Chelsea. It first flowered in 1885, but the cross had been effected some ten years before, between *C. longifolium* Hartwegi (Roezl) and *C. Schlumi albiflorum*. It is thus described in Messrs. Veitch's "Manual of Orchidaceous Plants": Upper sepal white tinted with pale rose in the basal area; lower sepal wholly white; petals spreading, white at the base and on each side of the median vein, pale rose at the margins and apex; lip pale rose pink suffused with pink, the infolded lobes ivory white. Staminode ivory white fringed with purple hairs at the back.

### The Week's Cultural Notes.

*Vanda Sanderiana* is one of the most beautiful of the single stemmed distichous leaved section of Orchids, and it is really much more easily grown than it appears, and there is no reason why the tyro in the art should not take up its culture. Where many growers have gone wrong with it in the past is in keeping it constantly in sweltering heat and moisture, and not paying proper attention to consolidating the tissues in autumn and resting it in winter.

Rest, as applied to Orchids, is an elastic term. A *Phalænopsis* rests in a temperature and atmosphere that would keep tropical *Dendrobiums* in constant growth, while the latter, if properly rested, are treated in a manner that would be fatal to the former. *Vanda Sanderiana* should be placed during winter in a temperature similar to that of the *Cattleya* house, and should be prepared for this lowering of the temperature by careful treatment now. Coming as it does from one or more of the Philippine Islands sun heat is absolutely necessary to its well being, and every ray of light should be admitted to it, short only of scorching the foliage. Being less sensitive than *Phalænopsis* this can easily be arranged, and the foliage will soon take on that hard, leathery texture, and feel that augurs well for continued health and free flowering.

The roots will need very frequent moistening if they are, as they always ought to be, growing close together in smallish baskets or other receptacles. Like *V. cærulea*, it never appears to be so happy as when its roots are fighting for a place, growing over and over each other, and through the rods of the basket to the congenial air of the Orchid house. Growers who are not happy without pulling the roots of their Orchids about continually should keep this fact in mind.

The showy Moth *Dendrobium*, *D. Phalænopsis*, is now growing very strong, and if it is to be a success must be rushed on, so to speak, to its flowering. Right up to the glass in a light house with a tropical temperature is its place, and the colour of the blossoms will be finer, and the spikes stronger in consequence. Its companions in position and treatment, such as *D. bigibbum*, *D. strebloceras*, *D. Goldiei*, *D. superbiens*, *D. Johnsoni*, or *Macfarlanei*, and others from Australasia, form a very fine group, flowering after the last of the ordinary members of the genus are past. All should grow a few of them, for there is nothing so showy and yet refined in the great Orchid family at the comparatively dull period when they flower.—H. R. R.

### Cactus Dahlias.

Dahlias should now be growing rapidly and will need a good deal of time spent in thinning and tying. Where possible a good coat of rough stable manure should be spread over the entire ground. In doing this, shake out the short and place it round near the plants, and over this spread the rough, to form a sort of barrier to the birds, which delight in scratching it in every direction but where it ought to be. Where fine blooms are wanted the plants will require feeding if at all dry at the root, and this should be done in a thorough manner. Sheep, horse, cow or chicken manure are all good things for the Dahlia. A tub holding about forty gallons of water should be filled, a good mixture made, and not less than two gallons given to each plant at one time. It is useless to give a little at a time, as it does not soak down to the roots, but if the above quantity is given, the ground is well moistened underneath where the root fibres are at work. This should be repeated as often as dry, and usually in ordinary dry weather twice a week will be sufficient.

All weakly growth must be cut out, especially that which runs up spindly in the centre of the plants, and a few, but not many, of the large leaves cut out as well. The amount which should be removed from each plant of course varies very considerably with the different varieties, some of spare upright growth needing hardly any, while another of a bushy nature will want to be thinned continually if the finest blooms are looked for. Strong, young growth from the bottom parts of the plant should be carefully tied up, as fine blooms usually come from them after the first and finest flowers on the main wood are over. Disbudding must be practised more or less. Some of the enthusiastic amateurs now grow Cactus Dahlias on almost the same principle as a *Chrysanthemum* for large flowers; that is, when they get the buds fairly showing on the main stems. They clear off everything in the way of shoots right down to

*Cypripedium leucorrhodum.*

the bottom. This, of course, is wrong, as the plants, apart from not producing a tithe of the flowers they ought, often become stagnant and do not throw half such fine blooms as plants which are in a healthy growing state with enough growth to stimulate root action, but not enough to overstrain the plants. As a rule the two side buds, and two to three joints down, is enough to disbud a stem, and then the lower shoots should come away strong and flower well later, although they will need a few of them cut out, or the whole plant will be too thick.

It is very necessary to tie the plants continually, as being so succulent and growing rapidly they have a habit of being in a loose state whenever the wind freshens a little, and it is no easy matter to get a plant back into shape once it gets blown about, and in tying always aim at so securing the branches that they will not break, but yet give to the wind, more or less. It is almost impossible to resist the wind as a wall does, but by carefully looping up each branch they will turn with the wind and spring back again unhurt. Earwigs and caterpillars must be hunted in the evening, or many fine flowers will be lost. After a short time their number becomes less and less if the blooms are looked round every night and the marauders picked off. Warm, dewy evenings are the best for sport in this direction.—D.

### Gooseberries and Currants as Standards.

For the benefit of the uninitiated, it may be stated at the outset that these trees are on clean straight stems from two to four feet high, Gooseberries being budded or grafted on stems of some member of the same genus, usually *Ribes aureum*—the Gooseberry being *Ribes grossularia*—while Currants are reared on their own stems. It is surprising how seldom trees of this sort are met with, as some of the leading nurserymen list them in their catalogues. They are as much trouble to rear as trained Apple and Pear trees, and thus, though the price is usually at least 2s. 6d. for a tree with quite a small head, no doubt from the nurseryman's point of view they are quite worth it. As, however, most people will hesitate at giving so much for Currant and Gooseberry trees, it may be both useful and interesting to describe the method of raising them, which though a somewhat long process, is nevertheless interesting from the very start till a really presentable tree is obtained. Of course it is only Red and White Currants which are grown in this way, Black doing much better as bushes, with a constant supply of new shoots from the ground.

The start is made by taking cuttings of the sorts desired, whether of Red or White Currants, or of *Ribes aureum*, for grafting or budding with the Gooseberry. They should be straight and strong well-ripened pieces of young wood from one to two feet in length, preferably fifteen to eighteen inches, taken, if possible, with just a small piece of the old wood attached, termed a heel. All the buds on the lower six or eight inches of the stem should be removed to preclude the possibility of all suckers arising from the roots in after years, which is the curse of badly grown trees. The best time to take the cuttings is the end of October or beginning of November, or as soon as the leaves are off. They should be put into a sandy soil, about six inches deep and about six inches apart in the rows, the soil being pressed down firmly round them, as cuttings of all sorts root more readily in a firm soil than in a loose one. Care must be taken not to break off the top buds, as a good strong leader is wanted from the terminal one, or, if there are several, from the central one.

In the spring tall sticks should be put to each cutting, and the leading shoot tied up to it as it extends, the side shoots from the cuttings being pinched back to two leaves as soon as they are fairly well developed, and the resulting growths to one leaf. The result of this is that the stems of the cuttings are clothed with leaves from near the ground to the top, which helps the stems to thicken, and stimulates root action, the added strength being sent into the leader when the laterals are pinched. In the autumn the leader should be shortened to about two-thirds of its length to ensure a strong continuation in the following spring, the cut being made just above a strong bud; in fact, the cut should be begun just below the bud, and on the opposite side to it, and, going upwards, finish just above it. The continuation shoot in the spring will be almost exactly in a straight line with the stem, and after a year's, or two years', growth the starting point will be only noticeable when looked for. The laterals should be treated in the same way as during the first year, both from the first year's growth and from the stopped laterals of that year.

When the leader has attained the height of about four feet, if Gooseberries are the objective, buds may be inserted some little way down from the top at the end of July or beginning of August, preferably in damp weather, or if grafting is decided on, the leader should not be shortened till the following March. If Currant trees are to be reared, the leader may be shortened six inches or so in the autumn, when three or four shoots will push forth in the spring to form the head of the tree. Any one of these shoots which is badly placed for forming a future branch, or threatens to grow in an awkward direction, should be removed completely before it gets woody, while the remainder may in

the autumn be cut back to half their length, which will mean that the branches will be doubled in number the following spring. The trees will be by this time three or four years old, and all the lateral growths of the stem may be removed, being cut off close to the stem with a clean cut.

We have now a standard tree, and from this point the training of the head is pretty much the same as that of any ordinary Red Currant or Gooseberry bush. Extension of a branch in any desired direction can be obtained by cutting back the leading shoot of that branch to a bud pointing in that direction. In May, any lateral growths for which there will not be room should be pinched back to three or four leaves, and the secondary growths to one leaf, to keep the middle of the tree from getting crowded, and in the autumn these should be further shortened to the clusters of buds at the base, and thus will be formed fruiting spurs for years to come. The ideal tree has every branch clothed with these, so that every branch is, in fact, a well-feathered cordon. Until the branches have attained nearly the desired length, the leading shoots may be left about half their length, or less, at the autumn pruning, which will ensure the formation of spurs along their whole length. If more is left than this some of the buds will not break in the spring, and a bare or spurless stem will be the consequence.

When the trees are getting nearly as large as desired, they may be shortened every year to two or three leaves. There is an alternative method, or, rather, perhaps a variation of this method, for Gooseberry standards when they have attained a fair size, and that is to allow half the leading shoots to remain their full length each year, as the young wood of Gooseberries often bears the finest fruit. These at the end of the season can be cut back, and their place taken by strong leaders from the young wood which was cut back the previous season. Birds in winter will sometimes nullify the good of the most skilled training by picking out the buds, and when these buds are the embryo spurs of future years it is very annoying and disappointing. A look out must be kept for this, and at first sign the trees should be dusted over with soot on a still, damp morning, and the operation repeated two or three times during the winter, especially after very heavy rains. Another matter to be looked to is the staking of the trees. This is generally necessary for some years, and if well done when the stem begins to carry a head, when, in fact, it is planted in its permanent quarters, it will probably last as long as wanted. But the grower must be guided by circumstances, as so much depends upon the height of the stem, and the vigour with which it was grown.

As regards sorts, the Red Dutch is one of the best for standard Red Currants, being a compact grower and a great bearer, large and deep red, and of good flavour. Raby Castle has also much to recommend it for this purpose, as its stout growth makes it especially suitable for forming a good strong stem, while its late keeping properties give it a special value, the fruit hanging on the trees until October without any difficulty if birds are kept off, and is then very refreshing for dessert. Of White Currants, the only variety needed is the White Dutch Cut-leaved, a moderate grower and abundant bearer, producing large bunches of fine berries, being an improvement upon the old White Dutch.

As regards Gooseberries, it does not matter much which sorts are chosen as regards habit of growth, though it should be borne in mind that there are two very diverse classes of Gooseberry in this respect—the pendulous, like Red Warrington and Keepsake, and the upright, like Red Champagne and Whinham's Industry—the former class producing a weeping sort of tree, by no means unornamental, and the latter a sturdy, erect-branched sort of tree, especially the two sorts named. In ordering trees from the nurserymen it will avoid disappointment to know that they do not stock standards of very many varieties, and it would be well, therefore, to give them considerable latitude.

Though the idea of standard Gooseberries and Currants may seem fanciful to many, they have at least one very distinct and definite use to which bushes cannot be put, and that is, that, by planting them alternately with bushes, more fruit can be grown on a given space. Everyone knows that Red Currants in garden ground tend to make a deal too much wood, but by having standard trees between them there is so much more demand upon the nitrogen of the soil—the sole cause of rankness of growth—that this luxuriance is checked, while their bearing will not be lessened, but rather increased, what little they suffer from the slight

shade of the standard being more than compensated for by the diminution of a rampancy, especially if the trees receive a dressing, as all fruit trees should do, of phosphate in some form every year, say basic slag at the rate of five pounds to the forty square yards.

This arrangement of trees is better for Currants than for Gooseberries—the latter rarely suffering from excessive richness of soil—and is best for trees in a row as distinct from a plantation, where there is presumably vegetable ground on one side. If carried out in a plantation it is obvious the standards—if they were alternate with the bushes in every row—would make too much shade. Red and White Currants may really be objects of beauty in this form, as the fruit hanging from the under side of the branches is so well seen, instead of being hidden, as is usual, with Currant bushes. If birds become troublesome a net is very easily thrown over the tree and just tied round the stem. With Gooseberries there is the further advantage of ease and comfort in picking the fruit, which is kept quite clean, and tends to develop a finer flavour by reason of the greater amount of air it gets. The latter consideration applies to Currants also. Still, when all has been said that can be said in favour of standard Gooseberries and Currants, one of the chief inducements to grow some trees in this form is the liking for change and variety in the garden, with the added element, to many of our friends, of novelty.—ALGAR PETTS.

## Scabiosa caucasica : Its Cultivation and Varieties.

Although the Caucasian Scabious, or Pincushion Flower, is said to have been in cultivation since 1803, it seems no time to those of us who have long been interested in hardy flowers since it began to appear prominently in catalogues of such plants. For some time, it is true, it has been a favourite plant with exhibitors and others, but it rose rapidly in estimation soon after it was "boomed" by a well-known hardy plant firm, and it then found its way quickly into gardens. Yet it is safe to say that it fails to give satisfaction in many gardens, either from want of hardiness, or rather, I should prefer to say, from lack of resisting power in certain gardens and districts, as well as from a defect it shows in some gardens—the non-development of some of its "petals," with the result of flowers without symmetry.

That it is a resister of cold is evident to those who have seen it doing for years in cold localities where frosts are severe, but those who have the widest acquaintance with it will be the readiest to say that it is not absolutely to be depended upon in every garden, as it will frequently succumb in some seasons, and may even require to be treated as a biennial. Its natural habitat is said to be dry and arid, and if this is the case it is not difficult to see that it is liable to loss from the excessive moisture, accompanied by a cold heavy soil, which are the only conditions under which it can be cultivated in some gardens. Yet, on the other hand, it seems to be often in dry and warm gardens that the Caucasian Scabious comes with imperfect heads of flower, and it would be interesting to know if this occurs in its native habitats. To be strictly correct, I should perhaps say that the defect really arises from the non-development of some of the flowers which form the outer range of the disk of the bloom, which is, of course, composed of a number of flowers, for the Scabious belongs to the natural order Dipsacæ. Although the Caucasian Scabious occupies arid situations at home, to grow it well so as to produce large and finely coloured heads it prefers a good and well-manured soil, with a fair amount of moisture in summer, but with little in winter. The best plants I have seen were growing near Edinburgh in good loam; and here I may remark, these had been seedlings, being better and more vigorous than plants propagated by division, though they vary in colour more than one may sometimes desire.

It is to this variation when grown from seeds that we owe the varieties of the flower. The type is almost a pale blue, with a tinge of lilac, but there are forms with pure white and creamy white flowers, and others drawing nearer to the hue of the type. It is, I find, desirable for the purchaser to see the plants when in bloom in case they are seedlings. He may then select the best colours he can see, and he has also an opportunity of seeing the best habited and most floriferous plants. The Scabious is very readily raised from seeds, sown either in a frame or in pans in a cold house, the young plants being pricked off when large enough before being planted out in the reserve garden. I have never met with self-sown plants. Recently several new varieties have been offered for sale, probably the best of these being one called *fimbriata*, which has several rows of "petals" which are fimbriated, and give the flower a neat and graceful appearance.

Some, however, would prefer the more formal flowers of that named *perfecta*, which is nearly semi-double, and has capitally formed blooms of a deeper lavender blue. Like all the forms of *S. caucasica*, these make very ornamental border flowers, while their blooms are much prized for cutting purposes, the long stems on which the solitary flowers are produced making them very well adapted for arrangement. Some consider the finely coloured and more robust growing *S. amœna* only a variety of *S. caucasica*, but it is recognised by leading authorities as a distinct species. It is equally worthy of a place in the garden. With all its defects and its own ways in some gardens, *Scabiosa caucasica* is one of the best and most distinct of our hardy flowers.—S. ARNOTT.

## Cabbages Infested with Grubs.

The plants, judging from the description sent by "N. H. S.," are evidently affected by the larvæ of the Cabbage fly (*Anthomyia brassicæ*), though the root fly (*A. radicum*) and the Radish fly (*A. floralis*) larvæ also attack the roots and root stems of the Brassicas. The larvæ, commonly called maggots, which they really are, being legless, injure the plants by eating passages in the stem and roots, sometimes destroying the whole of the Cabbage crop in gardens and fields. They are also injurious to Turnips. The Cabbage and Turnip maggots are to be found in dung, as well as at the roots of the plants, and in particularly bad attacks are often connected with planting or drilling on a supply of stable or farmyard manure, especially when this was in a new, rank state. Indeed, maggot in the Cabbage or Brassica tribe crop is most prevalent on land that has been heavily manured, not perhaps for the particular crop, but from successive and frequent heavy manuring. To grow Cabbage and Cauliflower well without a good supply of manure, or land in good heart, is scarcely feasible; but the dressings should be of thoroughly decayed manure, and these, accompanied with occasional dressings of lime. Gas lime, fresh from gasworks, is unquestionably the best and most practical cure for the maggot tribe that infest Cauliflowers, Cabbages, Brussels Sprouts, Broccoli, and the Cabbage tribe generally. It should be applied in the autumn, or when the ground is clear of crops, at the rate of  $\frac{1}{2}$  cwt per rod, 4 tons per acre, spread evenly on the surface, and left there a month or six weeks before being dug or ploughed in, and at least a similar time should elapse before the ground is cropped.

The gas lime must not be used over the roots of fruit trees, for which reason it is often needful to avoid its use in gardens, or only use it in the open vegetable quarters, so as not to prejudice the roots of bush or other fruit trees; hence dressing with freshly burned lime is resorted to. In the case of very foul ground 1 cwt per rod, 8 tons per acre, may be used. Stone lime is the strongest and best for such purpose, placing in small heaps convenient for spreading, covering with a little soil, and when fallen spreading, or slake with the smallest amount of water necessary to cause it to fall into an apparently fine dry powder, spreading while hot evenly on the ground, and as soon as convenient digging in. Autumn is the best time for applying the lime, always when the ground is clear, and some time in advance of cropping, choosing, if possible, a dry time for applying the lime and working the land, as this in a very wet time is prejudicial to the soil staple. In not very bad cases half the quantity of gas lime or of stone lime may be used, and the use of new or rank manure should be avoided.

As regards treating existing plants that are attacked by the maggots, easily known by their dull lead colour, and by the leaves drooping or flagging in the heat of the day, watering with lime water is useful, the hot lime being soaked for twenty-four hours in water, and the clear lime water used in the afternoon. Dilute the ammoniacal liquor of the gasworks with five times its bulk of water, and with the diluted liquor water the plants, keeping the liquid from the leaves. This liquor is also useful for watering Carrots affected with Carrot fly (*Psila rosæ*) grub, though really a maggot, the diluted liquor being poured between rows, not distributed over the tops of the plants. Watering with a solution of Little's soluble phenyle, 1 fluid oz to 3 gals of water, is also a cure for Carrot "rust," a term applied to the peculiar reddish or rusty colour to which the gnawed parts turn. You cannot do better than follow your neighbour's plan of watering the Carrot bed with diluted gas liquor.

For the Cabbages and Cauliflowers use at seed or planting time a mixture of three parts superphosphate and two parts bonemeal,  $3\frac{1}{2}$  lb per rod, or 5 cwt per acre, and top-dress. After singling out, or when the plants have got well hold of the soil, use a mixture of three parts salt and two parts nitrate of soda, using  $3\frac{1}{2}$  lb of the mixture per rod, or 5 cwt per acre, applying when the plants are dry, but the ground moist, and keep the mixture from the heart of the plants.

### Back to the Land.

Although I am convinced that this subject has a peculiar fascination for hosts of Journal readers, I should not have ventured to enter the arena again but for the recent remarks of "D. C.," who not only asserts that small holdings do not pay, but is also trying hard to convince us that it is extremely undesirable to attempt to increase their numbers. "D. C.'s" methods of argument are, however, not likely to appeal very strongly to practical men, because they savour too much of the "dreamy academical faddist" instead of being based on actual facts as we see them before us to-day. "D. C." has been asked to explain why the nationalisation of the land "would, if practically applied, lead to national suicide." At the outset he is obliged to admit that he cannot do so, but instead advances visionary forebodings conjured up in his inventive brain. I shall certainly not attempt to copy "D. C." in this respect, but will endeavour, as far as possible, to write of facts as they appear before us all, and from which fair deduction may be made.

**Do Small Holdings Pay?** The emphatic answer to give to that is that in districts where they have been given a fair trial, it is found that they do, and the demand for them increases each year. "Owner and Tenant" has already shown us how they are increasing in the Evesham district, and how the rental value of the land has also increased. In Lincolnshire the demand for small holdings is so great that the county council is taking up a large area of land to supply the demand. In some districts where such holdings have been a failure, the cause may be traced to a lack of ready money to tide over a difficult time; but when co-operative credit banks have been formed in connection with them, success has been almost, if not quite, universal.

"D. C." next raises the question as to whether or not we are more prosperous as a nation, while we allow a large portion of the land to remain derelict, than we should be if it were fully cultivated, and less labour was therefore available for manufacturing purposes. Well, for the sake of argument I will admit that the aggregate wealth of the nation has been more largely increased by neglecting the land, and paying great attention to manufactures, than it could have been by following the opposite course. But—and an important *but* it is—the increase of wealth has gone principally to the capitalist, the workers have not benefited to the extent they should have done, as the higher wages of towns have been absorbed in the extra cost of living and keeping up appearances. This is, however, not the worst phase of the question. The miserable conditions under which many of the workers in large towns exist, are such as to make the lot of small holders in the country infinitely better by comparison. Hitherto, we have been drawing upon the country to supply the workers of the towns, but when the supply fails—and it is already failing fast—what will be the condition of Britons? Why, we shall be a nation of degenerates, then good-bye to our country's supremacy. That is the serious problem which confronts us at the present time. We do not want to become a nation of small holders—in fact, if we did there is not enough land to "go round"—but we do want a fair percentage of the people to follow rural pursuits, if for nothing else than to maintain the stamina of the nation, and there are hosts of silent, uncomplaining plodders in large cities, who, to-day, would be leading far happier, healthier lives if in their younger days they had not left the country—or their parents had not done so. Easy facilities for acquiring land, backed up by co-operation among small holders will do more than anything else to give a fresh impetus to country life. It is a matter which vitally affects our continued prosperity as a nation, and the nation ought to be prepared to make some, and if necessary, a great sacrifice to deal with it in a satisfactory manner.

When comparing the wages—or profits—obtained from country pursuits we are too much inclined to consider the amount of income alone, instead of in conjunction with the really necessary expenditure. It is not so much what an individual *earns* as what he or she *spends* which determines their condition in regard to prosperity. In towns the necessary expenses are great, then there are others which might be termed luxuries; but which are really necessities, because everybody indulges in them for the sake of appearances. In the country such useless luxuries are as a rule dispensed with, and therefore the majority are happy and contented without them. If then, by cultivating a larger portion of our land we reduced the quantities of manufactured goods sold to other nations, we should also greatly lessen the amount we now pay them for useless luxuries. Those who are fairly prosperous while leading a country life are generally so much attached to their par-

ticular calling that they would scarcely care to change with anyone, certainly not with those having a princely income if compelled to reside in town to obtain it. The prosperous countryman realises that in rural life rest and ever changing sources of happiness are open to him, and that the intelligent individual can enjoy each day to the full, much more so than can the town dweller whose one great and devouring passion is to amass wealth, and infinitely more so than the city toiler can, whose home appears still more dismal by comparison with the splendours around.—H. D.

### Gold Medallist in Horticulture.

I think that "Inquirer," not having received an answer to his inquiries as to the horticultural qualifications of the advertiser who advertises himself as a gold medallist in horticulture on advertisement boards at Snow Hill, Birmingham, and other stations on the Great Western Railway, may safely take it for granted that he has no qualifications whatever, at least not of that quantity and quality gold medallists in horticulture are generally supposed to possess. A gold medallist in horticulture, as understood by horticulturists in general, is a person who has successfully passed a severe examination in botany, chemistry, or horticulture, or otherwise in practice has proved himself to be an expert in the art and practice of horticulture in general. To be the recipient of a small gold medal for an honorary exhibit of easily grown common hardy herbaceous flowers, and then to announce oneself as a gold medallist in horticulture is certainly a very flowery and exaggerated way of proclaiming it to the public. It is astonishing how some men can float on puff and blubber; how they announce themselves as lecturers in horticulture, and even assume and offer themselves as judges at horticultural exhibitions, when at the same time they have never grown fruit, vegetables, or greenhouse flowers in their lives; but if practical gardeners, especially near the Midland metropolis, would only decline to act with such men, and exhibitors would decline to accept their decision, we should soon see an end of bogus judges and lecturers. However, I do hope that after this correspondence the individual referred to by "Inquirer" will have the courage to qualify his claim as a gold medallist, otherwise I think the readers of the *Journal of Horticulture* may safely conclude that, as generally understood, he has no claim at all. If he has not the courage or the material wherewith to defend himself, perhaps someone amongst his friends will unsheath the sword in his defence.—ONE WHO WOULD LIKE TO KNOW.

### Germination of Seeds.

On looking over some old newspaper cuttings I came across the following article, written before my time, and if there are readers of the Journal who can remember it, or others who can express their opinions on the subject, I feel sure their statements would be received with a great amount of pleasure.

Some curious and all but forgotten experiments of much interest to agriculture and gardening have lately been revived by a German savant. Very many years ago it was discovered, and recorded that water saturated with camphor had a remarkable influence upon the germination of seeds. Like many another useful hint, the stupid world took no notice of this intimation, but a Berlin professor came across the record of it, and he appears to have established the fact that a solution of camphor stimulates vegetables as alcohol does animals. He took seeds in various sorts of pulse, some of the samples being three or four years old, and therefore possessing a very slight degree of vitality. He divided these parcels, placing one moiety of them between sheets of blotting paper simply wetted, and the other under strictly similar conditions between sheets soaked in the camphorated water. In many cases the seeds did not swell at all under the influence of the simple moisture, but in every case they germinated where they were subjected to the camphor solution. The experiment was extended to different kinds of garden seeds, old and new, and always with the same result of showing a singular awakening of dormant vitalism and a wonderful quickening of growth. It also appears from the professor's researches that the young plants thus set shooting continued to increase with a vigour and vivacity much beyond that of those which were not so treated. On the other hand, when pounded camphor was mixed with the soil it appeared to exercise rather a bad effect upon seeds. The dose in this latter case was possibly too strong.

At all events there is here a line of inquiry well worth following up by seedsmen and gardeners, and even farmers might try how far Wheat and Barley would profit from the strange property, which seems to be possessed by this drug over the latent life of vegetable germs.—R. P. R.

#### South American Cotton.

An attempt is being made in South America to grow cotton on a large scale, and ultimately to enter the markets of the world. The cotton grown there now is of different variety from that grown in North America. It grows on a very tall bush, almost as large as a small tree, and lasts in its production from seven to ten years. The seeds are very difficult to separate from the fibre, because they stick firmly to it. It is also difficult to pick, and rain and frost are said to turn it yellow.

#### The Pope's Knowledge.

Leo XIII. was devoted to gardening. On one occasion he summoned his gardener and complained about some Ivy which appeared in a pitiable condition. "Why did you let this plant die?" the Pope asked. "The soil is so bad." "You do not know what you are talking about, or else you think that we believe everything you may be pleased to tell us." Then, says "The Tatler," followed a regular lecture, which made the mortified gardener exclaim when the Pope had departed: "He can teach everyone, from the cardinals to his own gardener; you can't get over him." The late Pope's knowledge was almost as encyclopædic as Mr. Gladstone's, but the recluse had naturally much fewer opportunities for displaying it than the great Liberal statesman had.

#### Bare Orchards.

Past is St. Swithin's, and the Apples are justly supposed to have been duly christened; but it is many years since growers visiting their orchards have seen so little fruit. The keen frosts this spring made havoc with the large proportion of Apple buds that had loosened their winter garments, while where the trees were very robust, and the bloom was not killed, the rain that succeeded the frosts was so cold and heavy that the bees were unable to carry out their part of the work of fertilisation, or the wind to blow, or the birds to sufficiently shake, when alighting on the branches, the pollen from bloom to bloom by reason of the excessive moisture, so that nearly all the table and culinary varieties failed to fruit at all. It was hoped that the late trees would have fared better, but ungenial weather retarded them until their bloom matured just in time for the heavy downpour of early June, and in the few orchards where these set, the gales and late rains have destroyed a lot of the fruit. In consequence there will be a considerable shortage of cider, while there will be practically no perry of 1903 vintage. Not having any fruit to develop, the Apple trees this season are putting forth their energies to the production of growth, so that there is the prospect of a considerable amount of soft wood.—("Pall Mall Gazette.")

#### Liming.

Clay soils, when wet by rains, are not porous enough to allow the water to pass through them with sufficient rapidity. In consequence they become water-logged, and the air which is necessary for the healthful development of plant roots within the soil is excluded. In dry times such soils cake readily. Liming is an effective preventive or remedy for all of these conditions. Upon certain loamy soils containing considerable clay, liming often renders the surface more friable and less liable to form a crust upon drying. The improvement of drainage brought about by liming is one of the most effective means of preventing surface washing. When heavy rains occur on limed soils the water sinks into the soil instead of rushing over the surface. Soils which are composed of siliceous sand are frequently benefited by being rendered more compact by liming. On such soils carbonate of lime is preferable to air or water slacked lime, owing to the caustic nature of the latter, and the best material to employ where it is obtainable is a clay marl containing a fair amount of carbonate of lime. The clay as well as the lime tends to materially improve the physical condition of the soil. It should also be the aim to increase the amount of organic matter in such soils by the use of muck and stable manures, or by the occasional ploughing under of a green crop or of sward.

#### A Giant Spruce.

The largest tree in Oregon was felled recently to be sent as a curiosity to the World's Fair. It is the Aberdeen Spruce, and stood nearly 300ft high, 40ft around, and 118ft from the ground to the first limb. Its age is calculated at 440 years, being a good-sized tree when Columbus discovered the land that was afterwards called America.

#### An Arboreal Sphinx.

A curious tree, named Dderwen Grop, is situated on the right-hand side of the public footpath in Dynevor Park, Llandilo, Carmarthenshire. The tree is a fine specimen of the Welsh Oak, and is greatly admired by all who visit Dynevor Park. It is the property of Lord Dynevor, who lives at Dynevor Castle. A peculiarity about this tree is that, when looked at from two sides, the shape of a man's face is visible, the features being quite distinct. The trunk is 9ft in length, and its largest circumference is 21ft 10in. The portion which resembles the face of a man is 5ft 6in in length. The tree is nearly 40ft in height, and, although very ancient, its foliage is rich, both in quality and tint.

#### The Clock Plant.

The Clock Plant is a native of Borneo, and in that country even, it is said to be as rare as in other sections of the world. The plant derives its name from its peculiar habits, which are known to but few who have not studied the plant from a scientific standpoint. The plant has leaves of two sizes, one of which acts in the capacity of a minute hand, which keeps moving until four o'clock in the afternoon, and the other keeps going until morning. The larger leaves act as the hour hands. Starting in a position when all of the leaves lie close to the stem, with the points hanging down, they rise gradually until they turn toward the top, and then they drop to their former position. It takes the smaller leaves about one minute to go through this performance, and the longer leaves just about an hour.

#### Failure of Fruit Crops.

The failure of the fruit crop in England, which is without parallel in the memory of the oldest Covent Garden stallholder, is affording an opportunity to American and Continental rivals of home fruit-growers which is being eagerly acted upon. According to "The Daily Mail," exceptionally large consignments are arriving from Germany, where the weather this year has been much more conducive to fruit culture than in England. Owing to the destruction of vast crops of Plums, Pears, Cherries, and Apples throughout the home counties, English fruit is four times the price it is in average years. Plums and Green Gages, which usually sell at from £8 to £16 a ton, are fetching from £32 to £64. Dealers are fearful lest foreign fruit, which is generally excellent in quality, should eventually oust home-grown products. The first consignment of Californian Pears, comprising 10,000 cases, has arrived at Covent Garden, and is realising about 10s. per case of seventy Pears.

#### Quinces.

There is not a finer fruit in existence than the Quince. It ripens late, when cool nights and temperate days succeed the summer's heat. Housekeepers then have time to preserve and jelly the ripe Quinces. The varieties are more limited than Pears, Apples, Figs, or other fruits. Not more than five varieties of Quinces are quoted, but all of them are good. The Chinese is the most monstrous in size. As a rule, abnormally large fruits are not so much in the aggregate as medium or small sizes. A tree that bears as the Chinese Quince such large single specimens will be sure to have the number limited. For general planting the old Orange Quince is as good as any. The Champion is larger than the Orange, and every way a fine fruit. Owing to the scarcity of Quinces in market they sell for three times the price of Apples and Pears. The Quince is not a difficult fruit to grow. It reproduces itself rapidly. The scions come up freely and form surface roots. These can be annually cut off from the main root and set in the orchard. They will bear fruit the third year, and in turn each tree reproduces itself by scions. These suckers from the main root do not come up anywhere except close around the tree. Quinces, if let alone, will grow in clumps. They are more prolific and a better quality when kept to one trunk. They make fine trees.—("Southern Fruit Grower.")

# NOTES & NOTICES

## Gardening Appointments.

Mr. Mabbott, late head gardener to G. E. Jarvis, Esq., Doddington Hall, Lincoln, has been appointed head gardener to the Lady Maud Rolleston, Watnall Hall, Nottingham, and enters on his duties there on August 4.

## School of Gardening.

At the Gardens, Regent's Park, Mr. C. Brinsley Morley, vice-president, one afternoon of last week presented certificates to those students of the Royal Botanic Society's School of Practical Gardening who had successfully passed the Technical Education Board's examination in botany for intermediate scholarships. He congratulated Miss Verrall on having obtained two hundred and seventy-six marks out of a possible three hundred. Miss Sadler also had passed very creditably. In all thirteen certificates were awarded, of which six were taken by ladies.

## New York Parks.

The New York City Park Commissioners have just issued their report for 1902. The volume consists of 200 pages, with maps and other illustrations. In the Borough of Manhattan the approximate area of the public parks of every character is 1,415 acres, in Richmond two and three-quarter acres, in Brooklyn 1,026 acres, in Queens 550 acres, and in the Bronx 3,866 acres, a total of about 6,862½ acres. In the Boroughs of Manhattan, Brooklyn, Queens, and the Bronx, there are 321,561 ft of parkways, streets, avenues, &c., under the jurisdiction of the department. The vast playground for coming generations in the Bronx is made up principally by Bronx Park, 661 acres, against Central Park's 843 acres, Pelham Bay Park, 1,756 acres, and Van Cortlandt Park, 1,132 acres. All the parks and the territory under the jurisdiction of the department were improved in general condition at the end of 1902.

## Gift by Sir W. H. Tate, Bart.

The annual meeting of the Woolton Convalescent Home was presided over by the Lord Mayor of Liverpool, W. Watson Rutherford, M.P., the company present including the Lord Bishop of the Diocese, Sir William and Lady Tate, and a very distinguished company. Of the home itself nothing but the greatest praise can be afforded, the healthy position and the spacious grounds giving every facility for the poorer persons to get health and vigour if possible. Much of the ground is prettily laid out, and now it is proposed to deal similarly with the large field in front, Mr. Herbert, the courteous superintendent of the Liverpool parks, having prepared suitable plans with various shelters in case of bad weather. Sir William announced to the meeting his intention of defraying the sole cost of one, an announcement which was heartily received.—R. P. R.

## Weather and the Crops.

During the past fortnight heavy showers have fallen over most parts of the country, and in the south of England the rainfall was exceedingly heavy. The broken weather has been rather tantalising for those engaged in haymaking, but, as the temperature has been decidedly high, the heat and the moisture have been very welcome for the growing crops. The grain crops have been stretching out wonderfully, and now give promise of being well up to the average. Potatoes are looking very well in general, and nothing has been heard as yet about disease among the crop, though undoubtedly the sultry, thundery weather lately experienced has been very favourable for developing the *Pero-nospora infestans*. Turnips are growing rapidly, and give promise of being a full crop. Pastures are fresh and fairly luxuriant, so that there is abundance of food for farm stock. With bright warm weather, and a refreshing shower occasionally, there is still a possibility that the crops of this season may turn out much better than was expected a month ago.—("North British Agriculturist.")

## Cricket Match of the Royal Horticultural Society.

We are requested to announce that the R.H.S. Fruit v. Floral Committee cricket match, arranged to take place at Holland Park, Kensington, on the 8th inst., has been postponed.

## Temple House Gardens, Great Marlow, Bucks.

The register of rainfall for July, 1903, is 4.94 in, and for July, 1902, 0.92. The highest maximum was 85deg on the 1st of the month, and the lowest minimum 43deg on the 13th and 24th. The greatest rainfall for the month was on the 17th, when 1.64 in was registered between 5.45 and 8.30 a.m. There was thunder on the 18th, 19th, and 22nd, and heavy thunder and hailstorm on the 29th. The highest maximum for July, 1902, was 83deg on the 14th, and the lowest minimum 38deg on the 11th.—GEORGE GROVES.

## Correction.

In our report of the Cardiff Show we omitted to mention a highly meritorious exhibit, viz., an imposing group of Conifers and hardy shrubs in tubs arranged to form an avenue entrance to the popular Sweet Pea tent. The two sides were faced with fine plants of *Azalea mollis*, which had been retarded, and with small groups of *Lilium longiflorum* completed a most effective and attractive display. The specimen Conifers, standard Hollies, Portugal Laurels, &c., had already formed an exhibit at the Holland House show. In addition to the R.H.S. award the show committee awarded a silver-gilt medal to Messrs. John Waterer and Sons, Limited, for this exhibit.

## Exhibition of British Grown Fruit and Vegetables.

The Royal Horticultural Society will hold an exhibition of British grown fruits and vegetables at Chiswick on September 29, 30, and October 1. The prize schedule is now ready, and contains in addition to the list of prizes, an authoritative list of dessert and culinary Apples, Pears, and Plums. Special prizes are offered for preserved and bottled fruits. A conference on vegetables will be held on Tuesday, September 29, at 2.30 p.m., Mr. G. Bunyard, V.M.H., in the chair. The following gentlemen have been asked to read papers: (1) "On Cooking Vegetables," Dr. Bonavia and Mr. James Hudson, V.M.H.; (2) "On Vegetables all the Year Round for a Private Family," Mr. W. H. Divers; (3) "On Vegetables for Exhibition," Mr. Edwin Beckett; (4) "On Vegetables for Market," Mr. W. Poupart. Any contributions to the conference will be welcomed. Donations towards the prize fund will be gratefully received by the secretary, Royal Horticultural Society, 117, Victoria Street, London, S.W., of whom copies of the schedule can be obtained. Applicants should enclose a stamped envelope ready addressed to themselves.

## The Lennox Cup Competition.

This important and new departure in horticultural competitions, which has been inaugurated by Lady Algernon Gordon-Lennox, took place in the beautiful grounds of Broughton Castle on the 3rd inst. The weather fortunately proved to be delightfully fine, and the efforts of Lady Gordon-Lennox were crowned with complete success, for the numerous exhibits were of a very high order of merit, and visitors flocked to see the show and surroundings in their thousands. The competition was for village societies, and was confined to the three counties of Oxfordshire, Northants, and Warwickshire. Twelve splendid exhibits were staged, but the "men of Warwickshire," through the efforts of their sturdy representatives of Tysoe, "lifted the cup," and for a year at least that valuable trophy will remain outside the county from whence it came. The Tysoe exhibit was quite a remarkable one, every dish staged being of fine quality, and in many cases superlatively good. The crowning point being that the whole was so beautifully staged as to command the admiration of all. The pronounced success of this isolated village was principally due to the efforts of the Wells Bros. (well known for the excellence of their Potato exhibits at the Midland shows), the popular secretary, Mr. J. Ashley, and other villagers. The Banbury and District Horticultural Union were second, Irthlingborough (Northants) third, Charbury fourth, Chipping Norton fifth, Kenilworth and Grimsbury, Banbury and Neithrop Union equal sixth, Guyday seventh. An objection was eventually lodged against Chipping Norton for showing an incomplete collection. This is being considered by the committee.

## Michauxia campanuloides.

If, as we have often impressed upon us in familiar words, "Nature abhors a vacuum," equally does she detest uniformity and monotony. This is as evident in the realm of plants as in any other sphere, and we, her children, may well be partakers of her spirit. Even in gardening there is nothing more wearisome than to pass some time in a garden where each bed or border is an exact replica of its neighbours, and where all through the same dull tale of monotony prevails. Fortunately, such gardens are fewer nowadays, and there is a greater desire to avail ourselves of the bountiful choice afforded to us by the variety of plants at our command. Yet it is singular how in this even the claims of fashion seem exigent; how one copies another, and how the latest novelties or some familiar plants are seen with almost

name more easily negotiated by the "Man in the street" than campanuloides, descriptive enough as it is.

It is a distinct plant, even more so than the fine and newer *M. Tchihatcheffi*—here, again, I grieve to say, we must re-echo Curtis's plaintive remark on nomenclature—and always attracts notice in a flower border, with its tall spike of curious-looking flowers, whose narrow segments recurve like those of a Martagon Lily, and present a singular appearance as they droop from the stem and the axils of the branches. These flowers are white, tinged with purple, the corolla being divided into eight parts. The leaves, which are thickly covered with small, closely-set bristles, are irregularly lobed, the radical ones being lanceolate in shape. The whole plant grows from 4ft to 8ft in height, its stature depending upon the soil and treatment it receives from its cultivator.

The main charm of this *Michauxia* lies in its distinctness and

A Tasmanian Show: Chrysanthemums. (See page 128.)

wearisome reiteration. New favourites come in; old ones pass into the realms of oblivion; and we are all the poorer for this forgetfulness of good and distinct things.

Among the distinctive flowers that ought not to be forgotten—although one would not desire to see it everywhere—is a very distinct member of the Campanulaceæ in the person of *Michauxia campanuloides*. It was introduced from the Levant in 1787 by L'Heritier, who was the first to apply the name of *Michauxia* to it in honour of the French botanist, André Michaux. The name, even of the genus, is not particularly acceptable to many of us; but, as Curtis says in the "Botanical Magazine," where it is figured in Table 219, "When a plant has been named in honour of any particular person, that name must be retained in all countries, however uncouth its pronunciation may be, and there are few of our readers but what will think the present name sufficiently so." We must thus, I suppose, submit to this affliction as stoically as possible; but one would have preferred, for the sake of others, had Michaux applied to the species a

the character it gives to the border in which it is grown, a group of well-grown plants attracting much interest and forming a welcome variety from the surrounding flowers. Its one leading defect in the eyes of some is its biennial duration, which necessitates a stock being annually raised from seeds. At one time it was thought that these were not ripened in this country, but this is an error, in some parts at least, and in any case the seeds are readily procurable from the trade. They should be sown early in spring in gentle heat, or in a warm spot in the open in April. When large enough the seedlings should be pricked off, and in autumn they should be planted where they are to bloom, this being a warm, sunny, and sheltered position. When the flower spikes begin to show the plants should be staked, although in the more sheltered positions, where protected from wind, they look much better without staking. The soil ought to be rich, and well-grown plants in a suitable position will be both ornamental and interesting when they bloom in the course of the summer months.—S. ARNOTT.

### Stocks for Roses.

The present disastrous season will set those who have seen their newly planted Roses perishing with melancholy frequency, thinking on the question of the suitability of certain stocks for certain soils. By comparing the facts furnished by contributors, and by actual observation in different parts of the country on the growth of Roses in different soils, I believe the truth, as far as yet ascertained, amounts to this: That Roses flourish on their own roots in a greater variety of soils than in any other form; that they do best on the Manetti stock in light soils, where sands of later formations predominate; and that they do well on the Briar (*Rosa canina*), where the Briar is found to grow most luxuriantly in its wild state, as on stiff chalky land, and some clays. Assuming these data as approximating reality, we can readily account for the preference given by so many cultivators to Roses on their own roots, for the Manetti being selected by others, and for the disappointment frequently expressed by purchasers of Roses on the Briar, because these have been transplanted into soils less adapted to the stock than that from which it was taken before the Rose was budded on it.

The soil here is very light and of good depth, and being on a slight eminence is naturally well drained, the subsoil is the green ferruginous sand found in connection with the chalk system. I have at present in the garden about one thousand Roses in all forms, budded, grafted, on Briars high and low, and on their own roots. As I have stated above, the soil is of the kind in which I have always found the Manetti stock preferred; hence, I soon discovered the evident superiority of that stock for propagation to any other method, and that, too, as a medium for getting Roses on their own roots. Roses planted out in a soil like mine on their own roots, are very long in becoming strong, and vigorous enough to withstand all the vicissitudes of the climate—not so with well-budded Manetti plants, in nine cases out of ten they make strong shoots the first year, and in the second the flowers are satisfactory.

There is a greater distinction between grafted Manettis and budded ones than many people would at first be inclined to believe. My experience thus far shows that Manetti stocks grafted under glass with artificial heat, useful as the plan is for securing a rapid propagation of new varieties, have drawbacks when planted out of doors. In the first season they are very liable to mildew, make little growth, and produce few flowers, and it is not till the second or third year that they become useful plants. I have also found that they do not readily throw out rootlets at the point of union. With budded Manetti stocks the case is different, provided they are budded as low as possible and with the stock in the open ground. If budded early in the season a plant is formed at once which should be removed in the autumn; and planted in such a soil as mine, the bud should not be less than 4 in. below the surface. If planted deeply enough roots will be formed much more rapidly than when the junction is too near the surface; care must, of course, be taken that the root of the stock is not buried in wet cold soil, which will be very likely to cause the death of the plant. If Manetti stocks are budded late in the season, it is better to leave the bud dormant all the winter. This is done by deferring till the following February or March the cutting off any of the stock into which the bud is inserted. In severe winters some casualties may occur in late budding.

In October last I examined the roots of about fifty of my oldest plants, now grown strong. In most of the budded plants of more than three years old, roots had been formed upon the stems, springing from the point of union and that part of the first shoot below the surface. In the grafted plants which were bought, plants of the then new kinds, and propagated under glass, no such roots have been formed, although it is quite probable that they will be produced. Not wishing to remove the plants, I cannot say whether the stocks of those plants which have roots formed from the Rose are dead or not. I cut off several stems with roots on them and transplanted them to another place.—SURREY HILLS.

[As a commentary on the above we quote the following from "The Rose Garden" of Mr. William Paul:—"The Manetti is desirable for Roses in pots and admissible for hardy kinds when an extremely vigorous growth is desired. It has been recommended for delicate kinds that do not grow well on the Dog Rose, but my experience does not uphold the recommendation. That plants grow more vigorously on the Manetti the first year we do not deny, but their subsequent decline is also more rapid."]

### Roman Love for Roses.

The love of the ancients for Roses was something fanatical. I do not so much refer to the poets; for probably the modern and the antique bards may vie with each other in the use of the Rose as a common-place of poetical illustration; but I allude to a strong passion for the visible, tangible, scent-giving Rose, as something to be enjoyed by all the five senses, scarcely excluding that of hearing, for a rustle

of many Roses must have attended some of the more extraordinary manifestations of idolatry. A time without Roses was a contingency to be avoided at any cost: and the Romans, though the mildness of their climate allowed the adored flower to grow at an unusually late season, could not submit to the privations of a winter. Not only were whole shiploads of Roses brought from Alexandria in the inclement season, but various means were devised for preserving the gathered flowers throughout the year with as much freshness as was attainable.

The wreath of Roses, of which one reads and writes about so often without any other image than that of a curved twig with a tolerably rich supply of floral ornaments, was capable of a high degree of elaboration; for the Roman florists looked upon an enlacement of whole flowers as an exceedingly meagre affair. For a grand work of art they took the Rose leaves separately, laid them over each other like scales, and thus produced a sort of fragrant sausage.

This refinement in the construction of wreaths will show that the luxurious ancients not only insisted on the constant presence of Roses, but were determined to have them in as large a quantity as possible. The anecdotes which illustrate this form of the floral passion could scarcely be surpassed in wonder by the wildest imagination:—"To enjoy the scent of Roses at meals," says Herr Wustemann, "an abundance of Rose leaves was shaken out upon the table, so that the dishes were completely surrounded. By an artificial contrivance, Roses, during meals, descended on the guests from above. Heliogabalus, in his folly, caused Violets and Roses to be showered down upon his guests in such quantities, that a number of them, being unable to extricate themselves, were suffocated in flowers. During meal times they reclined upon cushions stuffed with Rose leaves, or made a couch of the leaves themselves. The floor, too, was strewn with Roses, and in this custom great luxury was displayed. Cleopatra, at an enormous expense, procured Roses for a feast which she gave to Antony, had them laid two cubits thick on the floor of the banquet-room, and caused nets to be spread over the flowers in order to render the footing elastic. Heliogabalus caused not only the banquet rooms, but also the colonnades that led to them, to be covered with Roses, interspersed with Lilies, Violets, Hyacinths, and Narcissi, and walked about upon his flowery platform."

As a source of artificial perfumes the Rose was employed by the ancients in other ways than in those oils and waters that are familiar to modern life. When the leaves had been pressed out for higher uses, they were dried and reduced into a powder, called "diapasma," which was laid on the skin after a bath, and then washed off with cold water. The object of the process was to impart a fragrance to the skin. As a medicine, Quinces preserved in honey were introduced into a decoction of Rose leaves; and the preparation was deemed good for complaints of the stomach. In the culinary art Roses had likewise their place of honour, and were put into many dishes for the sake of their pleasant flavour. For this end they were sometimes preserved—a delicate process, as they were very apt to become mouldy.—D. A.

### This Summer Time.

Gather ye Rosebuds while ye may,  
Old time is still a-flying;  
And this same flower which smiles to-day,  
To-morrow will be dying.

In these words of Herriek there is a combination of joyousness and sadness; a tone of mingled pleasure and foreboding, and yet they sound a predominant note of delight and of pleasure in the present, which we gardeners would do well to adopt. It is true enough that the autumn and winter are before us, when our favourite flowers will be no longer things of beauty, but mere shrivelled vestiges of what they are now. Yet in the present it is given to us to draw from their beauty inspiring draughts which will keep our hearts unseared and hopeful when they have passed away. Thus we may look upon the reign of Queen Summer as a period of joy to give us strength for the future, and a time which it is our duty to make the most of, so that we may enter upon the dreary days undisheartened and full of hopefulness. And how our flowers do minister to these cheering thoughts! These Rosebuds Herriek counsels us to gather "while we may," with all their beauteous sister flowers, speak eloquently to us and inspire us with "thoughts too deep for words;" but thoughts which help us immeasurably. Let us look at them now, even if our glance can only include a few of the many things which might come within its range.

Lately we have all been praising the Rose, whose opening flowers called forth the delightful stanza of the old poet, but sitting now with this queenly flower in full view one must once again express one's delight in the "summer's queen." From the window of my little garden study one cannot look out without the eye being caught by the sprays of Wichuariana hybrid pink Roamer which hang over a part of some of the panes, as if to insist that these pretty single flowers in such profusion cannot go unrecorded. From another window there is a glimpse, too, of the brilliant flowers of Crimson Rambler, not so plentiful this season as one would like, and a lovely unnamed double white Rose, which has proved more generous than William Allen Richardson, which grows beside it, but which is this year chary of its blooms. There, again, is the old blush Monthly Rose, almost a constant bloomer here, save for a short time in the depth of winter. On a pillar is the free-blooming Longworth Rambler;

on another Madame Isaac Pereire. Close by, on the trellis, is Madame Alfred Carrière, one of the most lovely and most dependable of all my Roses. Further away is the climbing form of the lovely Mrs. W. J. Grant; while opposite it again are the great, deep-coloured blooms of Noella Nabonnand, and the fine flowers of Souvenir de Madame Joseph Metral. Up and down are these and other Roses; for the Roseless garden is an anachronism in a summer day.—S. F.

## Methods of Propagation.

**RUNNERS.**—Some plants are increased by runners, good examples being seen in the Violet and Strawberry: the latter is invariably propagated in this way. Runners proceed along the ground, and form small plants, which are at first nourished by the parent, but afterwards root and support themselves. Roots are formed naturally, but the process may be hastened by pegging the runner in the soil. The Strawberry often makes very long runners, from which proceed several plantlets. The strongest must be selected, which will generally be the one nearest to the parent plant; the part of the runner above the plantlet must be cut off; it may then be secured in the soil by means of a peg. Some make a practice of twisting the runner; this operation ruptures the vessels, and checks the flow of nourishment from the parent plant, and is said to hasten the rooting process of the plantlet. Runners are often rooted in pots; indeed, this is the best way for many purposes. Water must be applied when required until the plants are well rooted, when they may be severed from the parent plant. It is best to give them a shady position for a few days before planting out or potting, as the case may be. Runners may be taken off before roots are formed; it will then be necessary to insert them in a frame. The latter must be kept close and shaded until the plants take root, afterwards gradually inure to light and air.

**SUCKERS.**—These are branches or shoots of underground origin, and when furnished with a good number of roots may be detached and planted without further preparation. This is a very simple method, by which many plants may be propagated, and is much practised by nurserymen. We have good examples in such plants as Lilac, Berberis, Spiræa, Raspberries, Filberts, and Black Currants. This method is not at all times desirable, as plants produced from suckers will generally throw out suckers themselves; and we cannot therefore get plants with a clean stem. Black Currants are increased in this way as a ready means of securing young wood, which invariably produces the finest fruit. Market growers, I believe, generally grow their bushes on this principle. It sometimes, however, makes a great deal of extra labour at pruning time, and the ground is more difficult to keep clean. There are plants propagated in this way that would be better raised from cuttings.

**BULBS** consist of three parts. In the first place we have a more or less fleshy disc, from the under side of which the roots arise; secondly the fleshy coats or scales borne on the disk; thirdly the central shoot, also borne by the disk, which is composed of rudimentary leaves and flowers and is protected by the coats or scales. In Lilies there is a large number of small scales, which only partially overlap. These are termed scaly bulbs—tunicated bulbs—examples of which are found in the Hyacinth and Onion. The scales form a complete sheath, one within the other. The number of scales constituting the mass of a bulb varies much in different plants. As already stated, the Lily has numerous scales; so, also, has the Hyacinth. The garden Tulip and Crown Imperial have comparatively few scales, while in Gagea and other plants there exists only one. There are annual, biennial, and perennial bulbs. The garden Tulip is an example of an annual bulb. *Fritillaria imperialis* (the Crown Imperial) of a biennial bulb, and the garden Hyacinth is a perennial bulb. Bulbs are multiplied by buds developed in the axils of the scales in the form of new bulbs. These are produced, in many instances, in great abundance; Lilies, for example, where we find a number of small bulbs around the old ones, as well as those within the scales. Most kinds of Lilies may also be propagated by bulb scales. They should be carefully detached and bedded in sandy loam. If placed in a warm temperature most of them will make one little bulbil, sometimes more. These will in time develop into flowering bulbs. *Lilium bulbiferum* and *L. trigynum* bear in the axils of the leaves quantities of bulblets. They

may be easily collected in summer, and if treated in the usual manner will eventually form flowering bulbs. *Dentaria bulbifera*, one of our native Cruciferous plants, may be increased in the same way. *Vallota purpurea*, *Hippeastrums*, the bulbous Irises, and other bulbous plants (although many may be easily propagated by seed) are usually increased by this method. Starving the plants is said to induce them to make offset bulbs, splitting the bulb into segments will also cause the production of small bulbs. This operation should take place when the bulb is in full growth and vigour. The small bulbs may be bedded in boxes or pans, or in some cases in lines in the open ground. They should be kept free from weeds, and apply water when required.—J. S. U.

## The Carrot Crop.

"W. S." has undoubtedly done good service in drawing attention to the generally unsatisfactory condition of this crop during the present season, because it is important to take every possible precaution to prevent a similar occurrence another year. During the last few weeks I have visited upwards of 200 gardens, and in very few have the Carrot beds been quite satisfactory. In many instances the Carrot grub had wrought great havoc, and the rows were in consequence "patchy." In other cases, although the rows were fairly even, the aphids had prevented the plants from growing with their usual freedom. Since the recent rains, however, matters have considerably improved, and where the young roots had not been attacked by grub the crops will, I think, eventually turn out fairly well.

I am fully aware that both Mr. A. Dean and "W. S." are well up in the many "wrinkles" connected with Carrot culture, but I cannot help thinking that both take a somewhat too gloomy view of the matter in intimating that there is anything very mysterious about the many failures recorded, or that really effectual methods of prevention have yet to be brought forward. The season has been a peculiar one. After the seed was sown we experienced a long spell of wet, cold weather, and in some cases the seed rotted instead of germinating. In others, although the young seedlings pushed through the soil, they could make but little headway against the hordes of slugs which were waiting to devour anything in the shape of young vegetation. These conditions accounted for many of the early failures. The young plants were simply eaten as soon as they pushed through the soil, and those who at that stage were wise enough to fork over the ground and sow again have, as a rule, succeeded much better since. Many growers managed to get over the difficulty of the early part of the season, and had fairly even beds until the spell of hot weather set in, then aphids and grub soon wrought havoc with plants weakened through having an unfavourable start.

My firm conviction is that where the crop has been a real failure, either early or late in the season, it could have been prevented by due attention to well known methods of culture, and by adopting precautions against insect pests. During some seasons Carrots grow so easily, and are troubled with neither insect pests nor diseases, with the result that under pressure of other work we are inclined to neglect such methods of culture which entail a little extra trouble, and then, when unfavourable weather comes, the crop suffers in consequence. It always pays to give a little extra attention to soil preparation on land intended for Carrots. Apply soot and throw it up roughly early in the season; then before sowing give another dressing of soot and fork the soil over again, choosing, if possible, a sunny day for the purpose. After sowing, if the land is light, tread or roll the surface, and finish off with a light raking. Run the hoe through the bed as soon as the rows can be distinguished, and hoe regularly once a week after, until the tops become too large to allow this to be done. I have great faith in the regular use of the hoe. Early in the season it helps the young plants forward, and prevents slugs from working, as they detest freshly loosened soil; and later on it prevents to a great extent the ravages of the grub. One prolific cause of trouble with this pest is that cultivators will neglect to thin their crops early, in order to get roots for pulling young. When these are pulled during the active season of the Carrot fly, especially during hot weather, the insect meets with holes ready prepared for the reception of their eggs, and who can blame them for turning them to good (?) account?

Those who want a supply of young Carrots should sow a bed specially for that purpose, and pull the whole of them while they are young. The main crop for autumn and winter use ought to be partially thinned as soon as they are an inch in height. After this first thinning there should be about twice as many plants as will eventually be required. A few weeks later remove every alternate plant, tread the soil firmly around

those left, and dust with soot between the rows when the next shower occurs. Watering the rows after thinning also prevents the insects from entering the soil to deposit their eggs. When hot weather occurs during June, if the paraffin emulsion mentioned by Mr. Dean is sprayed over the tops of the plants, it will undoubtedly keep the winged insects away, and thus prevent injury to the crop. When a bed has been infested, and the same piece of land has to be used for the Carrot crop the following year, a dressing of gas lime (40lbs per rod) should be given in the autumn to kill the maggots and chrysalids in the soil.

Last year I met with several cases in which the grub had almost entirely ruined the crop. I then strongly advised those interested to follow closely the methods of culture above indicated, which they have done, and this season their beds are almost free from maggot, while those around them have suffered badly. I do not contend that everyone can secure complete immunity from an attack in one season, because the chrysalids in the soil have to be destroyed; but if they will stick to the above instructions they need have no fear of this—to many—dreaded foe.—WARWICK.

## Horticulture in Tasmania.

The season of the "Mums" has now passed, and winter's garb is clothing all around. Just a few Rosebuds are lingering as if loth to leave us, even for a while. But we are content, as this has been a successful season, and the "autumn queen" was decked in her finest array. Chrysanthemums are grown here principally in the open, and towards their blooming time are protected from the weather by coverings; as, for instance, our principal grower, Mr. Charles Bourke, an enthusiastic amateur, has erected over his plants a framework, and over this is stretched hundreds of yards of calico, and in their blooming season a visit to his garden is a great treat. It is pleasing to note that several amateurs have taken up the idea of growing "Mums" in pots; but when one remembers a plate and an account of Miss Nellie Pockett, appearing in the Journal of February 15, 1902, one wonders if they will ever be able to grow them to that perfection; but I trust some of us have a gardener's virtue, patience and perseverance.

At the Launceston Horticultural Society's autumn show, held on April 29th and 30th, were to be seen some lovely "Mums"; the most noticeable were Fred Hannaford, Madame Carnot, Miss Luey Evans, Alfriston, and Miss Nellie Pockett. The prize for the best bloom was won with a beautiful bloom of Mrs. W. Mease. This variety seems to do remarkably well here. Some very pretty Cactus Dahlias were also shown, Mrs. Edward Mawley being the most admired.

Apples from Lilydale (Northern Tasmania) were excellent specimens, and were the subject of particular attention by the visitors. Among those who attended the show was Mr. A. Hunter, of "The Penang," Gosford, New South Wales. Mr. Hunter is the senior partner of the firm of Hunter and Sons, well known orchardists. The Apples, he remarked, were excellent, and for quality could hardly be surpassed. If orchardists wished to develop the export trade they should take great care in the selection of the fruit, and not pack it when in an unripe state. Mr. Hunter was a practical admirer of Mr. H. W. West's Apple trophy, as he supplemented the prize with a donation of £1 ls.—H. F. R., Launceston, Tasmania, May 20, 1903.

Some of our readers may know Launceston. Few more delightful spots exist in the world, or are more favoured by climate and situation, unless it be Hobart Town, the capital of Tasmania, on the Southern coast. Both were founded some eighty years ago, but the population of Hobart is about 40,000, or some four times that of Launceston. Tasmania, which is about the size of Ireland, lies about as far from Melbourne as Jersey from England, and is the favourite refuge of the Australians from their sun-stricken plains during December to April, where they find a land of English verdure with a climate midway between that of Devonshire and the Azores. It is at Launceston that the visitor from Melbourne first catches sight of the beauties of Tasmania.

The following comments of the local Press are supplementary to those already given upon this interesting show:

The autumn show in connection with the Launceston Horticultural Society was held in the Albert Hall on April 29, and was the most successful since the formation of the society. Although the favourable season was in no small measure responsible for the high quality of the exhibits generally, the total entries were quite a record, and in addition the attendance during the afternoon was much larger than at previous shows. The arrangements for displaying the exhibits were excellent, each of the sections being on separate tables, and the "amateurs" and "professionals" were distinguished from each

other by white and blue cards respectively. The Apple trophy, which was exhibited by Mr. W. H. West, and was given the principal honours, was quite a show in itself, and with the many other exhibits from Lilydale was an object lesson as showing the capabilities of that district for fruit growing. No less than eighty plates of Apples of assorted varieties were exhibited. Other fruits were well represented, the principal honours going to growers in the Lilydale district.

The show of Chrysanthemums was very fine, and Mr. Charles Bourke's exhibit of these favourite blooms attracted considerable attention. It may be interesting to indicate the blooms with which Mr. Bourke's successes were won. His twenty-four embraced Daniel Lambert, Acme, Madame Ad. Chatin, Silver Queen, Mrs. Thomas Lee, Modesto, Mrs. T. Carrington, Nellie Pockett, Miss Baden-Powell, Mermaid, Alfriston, Florence Molyneux, Miss Luey Evans, Mdle. Gabrielle Debie, Meredith, Frank Hannaford, Australie, Lady Hutton, Madame Carnot, Lady Roberts, Inter-Ocean, Edwin Molyneux, Mrs. W. Mease, and Mrs. M. J. Darcey. His eighteen were Mrs. W. Mease, Australie, Lord Hopetoun, Modesto, Mermaid, Mrs. W. J. Darcey, Miss Lucy Evans, Acme, Mrs. J. Gunn, Madame Carnot, Lady Hopetoun, Nellie Pockett, Mrs. C. Salter, Western King, Mrs. Tom Rand, Mr. T. Carrington, Miss Baden-Powell, and Mdle. Gabrielle Debie. His twelve were Mrs. W. Mease, Graphic, Lady Roberts, Modesto, Lord Hopetoun, Silver Queen, Miss Lucy Evans, Nellie Pockett, Meredith, Marie Browning, Mr. T. Carrington, and Mermaid. Without exception, and taking everything, including the gale, into consideration, Mr. Bourke's display was a triumph in cultivation. The love of the Chrysanthemum is evidently extending.

## Flowers of Princes and Nobles.

At this moment I am unable to say what is the method adopted by other nations of Europe, but it is no longer customary for the British soldier to carry his colours to the battlefield, or on a march through an enemy's country. It is thought the colours are dangerous, because their conspicuousness makes them objects of attack. But, on the other hand, soldiers lose the stimulus or encouragement formerly given by the sight and presence of a flag which had been borne along many a weary tramp, and flourished over the scene of hard-fought victories. In the olden time, besides standards, it was common for an army to face the enemy, every soldier bearing on his head-gear, or some part of his clothes, a twig or spray of some plant. It did not put a man in special danger when thousands had the same badge or emblem.

A notable period of English history was that in which the Rose became an important sign; the Yorkists took a white variety, the Lancastrians chose a red one, and during the Wars of the Roses these flowers were often displayed upon the battlefield. The "bonny Broom," a flower, no doubt, much easier to obtain wild formerly than it is now, was exhibited on helm or belt, since some incident had linked it with the Plantagenets. Hawthorn or Whitethorn is said to have been the chosen symbol of the Tudors, and the unfortunate Stuarts took the Thistle, a suitable emblem indeed for that race, which caused so much mischief. Plants, however, were not always worn by soldiers as a memorial of some leader or party; other reasons led to their appearance on the scene of war. The Royal Fern, that handsome Osmunda, which at one time was found in many places from which it has vanished, had its value because it was believed to ensure Divine protection if a sprig was attached to the person. Some say the Fern became notable through its association with the Pagan deity Thor, yet it was sometimes called "Herb Christopher." Our common Herb Robert is supposed to be named after a St. Robert through link it to Robert, Duke of Normandy. Anyway, the plant was credited with curative and prophylactic powers, hence people carried sprigs of it as a safeguard. A still greater value was attached to the woodland species, Geranium sylvaticum. This plant, however, being local, was less attainable.

Within the necessarily brief limits of my space, I cannot say much on my rather extensive subject, and must only refer to a few of those flowers memorable because of their connection with families or persons. We will glance back first at the Broom, already named as having been chosen by the Plantagenets for their symbol, forming, in fact, part of the title of the family. Geoffrey, Duke of Anjou, father of our Henry II., was, according to the legend, led to

gather the plant, when he passed masses of it, while going up a rocky path. He chose it for his emblem because the Broom held on bravely in the midst of difficulties, of which he had to encounter many. A very good meaning, but it seems to have been also regarded as a token of humility. It was worn by the Plantagenets till the "Hunchback Richard" ended that race. In 1234, Louis IX. of France instituted an order of knighthood, the members of which wore a chain of Broom flowers entwined with white Lilies. This is significant, if trustworthy, indicating that the Lily was even then adopted as a symbolic flower by the French.

There is no doubt that the Hawthorn or Maybush was the Tudor emblem, and we all know the story that this arose from the discovery of a crown in this bush, which was brought to Henry VII. on Bosworth Field. One feels a

Lily? There does seem good evidence that the earlier "Lily" was a species of Iris, the purple flower, in fact; it is quite recognisable on ancient devices by the drooping form of the petals. Old English authors allude to the Fleur-de-Luce as distinct from the Lily, yet Shakespeare speaks of it as a Lily, and Chaucer, in a line of his long before, implies that it was one. Again, some declare that the Crusaders brought from Palestine golden Lilies, which were placed upon their banners, and many references occur to the golden hue of the symbolic flower of France. Certainly, when a Lily became the special flower of the House of Bourbon it was some white species. It must have been white when the Dauphin was spoken of as the "Lily of France." Tasso, in his time, called Frenchmen the "Golden Lilies." During the unscientific ages we could not expect

A Tasmanian Show: The Fruit Section.

certain amount of suspicion about this story, and the Hawthorn, a species of varied significance, might have been chosen for other reasons. Thus, from the tradition that Christ's crown of thorns was made of its twigs, arose a belief that they afforded protection from evil spirits, and the Greek brides wore Hawthorn bloom as a symbol of hope. When in exile, Henry of Lancaster is said to have told his adherents to make the Forget-me-not their badge a token of remembrance, and hope too.

Probably the longest and warmest controversy about a badge or symbol has been that arising from the Lily of France, nor have the disputers succeeded in clearing up the subject much. This, however, is decided, that Fleur-de-Lys came from Fleur-de-Luce, which is really Fleur-de-Louis, after Louis VII., who made very conspicuous use of it on banners, though some assert the devices can be traced back to Clovis I. in the fifth century. But what was the so-called

modern accuracy. Two Italian parties, the Guelphs and the Gibellines, took for their tokens red and white Lilies, and an orange Lily was the original symbol of the Princes of Orange.

Archdeacon Hare tried to prove that the Sweet William was a corruption of Saint William, the flower being dedicated to that saint, whose anniversary falls on June 25, and suggested that others of the "sweets" might be "saints," too. But the Rev. H. Friend thinks the French name of *Ællet* was turned into "Willy," and the flower got associated with some William or other. Gerard speaks of the plant as a common garden flower in 1568. It would be pleasant to believe the flower was named after William Shakespeare, surely the sweetest of all Williams, but we have no evidence of that. Others have suggested William of Aquitaine, the soldier monk, who was famous in his day throughout South Europe. It is likely the original

Sweet William was a Pink, *Dianthus prolifer*, a beautiful species found in Kent occasionally. We may note that the Canterbury Bells of Kentish woods seem to have taken title from the small horse bells of pilgrims, which they resembled in shape.

Chelsea, now a London suburb, but formerly a "village of palaces," was fragrant with its herb gardens, one of which, the last to disappear, was in a part of the ground belonging to Beaufort House, the mansion of Sir Thomas More. He tells us himself, that a favourite flower of his was the aromatic Rosemary. "I let it run all over my garden walls," writes he, "not only because my bees love it, but because 'tis the herb sacred to remembrance, and therefore to friendship." A favourite flower of our forefathers, the Columbine, was the chosen badge of the old Barons Grey. The emblem selected by Catherine of Arragon was the Pomegranate, and the little Mignonette found its way into the armorial bearings of the House of Saxony, through its being chosen as her favourite by the Countess Charlotte. The first Empress of Mexico founded an Order which was adorned with a scarlet ribbon because she was so fond of the Poppy flowers. Some state that before the Monks-hood or Aconite was ecclesiastical it belonged to Odin, being called Odin's Cap or helm, being supposed to confer the power of making the wearer invisible. The Houseleek, at one period Thor's Beard, came afterwards to be St. George's Beard. Though the Rose is the symbolic flower of England the Harebell was early appropriated to that saint or hero. Many of the Highland clans used various plants as emblems or badges, amongst these were Heather, Juniper, Mistletoe, Holly, Pine, Fir, and others.—J. R. S. C.

## Societies.

### Royal Horticultural, Drill Hall, August 4th.

The Drill Hall was sparsely filled on this occasion, probably due to the holiday the preceding day. Hardy flowers were conspicuous by their absence, but it was said that exhibitors in this section were compelled to cancel their space through the ravages of the weather. The Cacti exhibition proved a failure, not a single amateur staging.

#### Orchid Committee.

Present: Harry J. Veitch, Esq. (in the chair); and Messrs. Jas. O'Brien, de B. Crawshay, Norman C. Cookson, F. Wellesley, H. Pitt, E. Hill, G. F. Moore, J. W. Odell, W. Boxall, W. H. Young, H. Little, H. Ballantine, J. Coleman, and J. Wilson Potter.

Orchids were somewhat sparsely represented, Messrs. Hugh Low and Co., Bush Hill Park, N., staged plants of *Cypripedium Rothschildianum*, *C. R. superbiens*, *C. niveum*, and *C. Kimballianum*, all well flowered; *Cattleya Mary Gratrix*, a cross between *C. Harrisoniae* and *C. Schofieldiana*, was conspicuous; while nice plants of *C. Eldorado* variety were good.

Mr. J. Davis, gardener to J. Gurney Fowler, Esq., staged a small collection, chiefly *Cypripediums*, which included well grown plants of *C. Rothschildianum*, *C. Miniatum*, and *W. R. Lea*, also a nice specimen of *Lælia Digbyana purpurata*, var. *King Edward VII.* From Messrs. Thomas Cripps and Son, Tunbridge Wells, came a pretty display of *Disa grandiflora*, arranged with small *Coeos Weddelliana*.

Messrs. Jas. Veitch and Sons, Ltd., staged *C. atalanta superba* and *Lælio-Cattleya Issy*.

Mr. Barker, gardener to W. P. Burkenshaw, Esq., Hesse, sent a large *Lælio-Cattleya*, named *Ivernina*, which was remarkable for its large size and rich purple lip. The same exhibitor also staged a form of *C. gigas* called *White Queen*, a fine variety. Mr. W. H. Young also staged a few *Cattleyas* and *Lælio-Cattleyas* in good form. Mr. H. T. Pitt, Stamford Hill, also contributed a few specimens.

#### Floral Committee.

Present: H. B. May, Esq. (in the chair); and Messrs. C. T. Druery, J. Jennings, C. J. Salter, G. Reuthe, Chas. Dixon, J. A. Nix, Chas. E. Pearson, C. E. Shea, E. H. Jenkins, W. M. James, G. Nicholson, W. Howe, R. C. Notcutt, and Geo. Gordon.

Cacti were represented only by two exhibitors, Messrs. H. Cannell and Sons, Swanley, coming up with a fine display, in which were noted specimen plants of *Echinocactus Ericsoni*, *E. peninsulæ*, *E. Wisleyense*, *E. ornatus*, *E. Emoryi*, *E. Junori*, and *E. electracanthus*. The *Mammillarias* were represented by M. Nicholsoni, M. Gabbi, M. nogralensis, M. pusilla, M. angularis, M. denticulata, M. Donati, and M. nivea, *Trichocaulon piliferum*, *Opuntias* in variety, *Echeverias*, and a host of other species completed a really fine display.

The other collection, exhibited by Mr. Richard Anker,

Addison Nursery, Napier Road, W., was smaller, and consisted of smaller plants, *Mesembryanthemums*, *Opuntias*, *Mammillarias*, in variety; *Echinocactus longihamagus* Wrighti, and several others.

Messrs. J. Cheal and Sons, Crawley, exhibited a fine collection of flowering and foliage shrubs and trees in a cut state. The *Spiræas* were excellent, and embraced the following kinds: *S. Fortunei alba*, *S. salicifolia alba*, *S. Douglasi*, *S. brumalda*, *S. Nobleana*, *S. Anthony Waterer*, *S. brumalda superba*, *S. semperflorens*, *S. Billardieri*, and *S. Fortunei rosea*. Other noteworthy shrubs were *Buddleia variabilis*, *Colutea purpurea*, *Diervilla lutea*, *Olearia Haasti*, and *Genista capitatus*, with a variety of *Hypericums* completed the flowering portion. The same firm also opened the Dahlia season by staging two boxes of Cactus, and a box each of Pompon and single varieties. Considering the early period, the blooms were good. In the Cactus were noted good blooms of *Columbia*, *Clara G. Stredwick*, *Floradora*, F. H. Chapman, Alpha, Imperator, H. F. Robertson, Mrs. E. Mawley and Mayor Tuppenney; also some promising seedlings.

Messrs. Paul and Son, Cheshunt, contributed an interesting display of Roses, which included several varieties rarely seen. These included *R. viridiflora*, *R. anemonæflora*, *Roger Lambertin*, and *Rugosa atropurpurea*. Those of the more orthodox type were represented by nice vases of Mrs. J. Laing, Duke of Edinburgh, Lady Battersea, Cheshunt Scarlet, Frau Karl Druschki, White Lady, Liberty, and Sir Rowland Hill.

Messrs. Jas. Veitch and Sons, Ltd., staged a group of *Lantana salviaefolia*. The plants were about 30in high, and the flowers a pleasing shade of heliotrope; also three large baskets of *Senecio clivorum*, a plant with large leaves, bearing huge heads of orange flowers.

Ferns came from Mr. H. B. May, Dyson's Lane Nursery, Upper Edmonton, the chief feature of which were the *Nephrolepis*, comprising thirty-six species and varieties. Palms and small *Adiantums* were also employed. The specimens were *N. acuta*, *N. tuberosa*, *N. exaltata plumosus*, *N. E. multiceps*, *N. Piersoni*, a really fine form, and one that possesses good decorative value, *N. cordifolia recurva*, and *N. pectinata*. Nice plants were also staged of *Campanula isophylla*, *C. i. alba*, *C. i. Mayi*, *C. Barrilieri*, *C. gloriosa*, and *C. Balchiniana*.

The most attractive exhibit in the hall came from Messrs. R. and G. Cuthbert, and was composed of Palms, *Hydrangea paniculata grandiflora*, standards, and carried fine panicles of bloom; *Lilium longifolium album*, growing in 5in. and 6in. pots, simply grand, many carrying twelve blooms. Vases of *Phlox Fiancée* were also effective, as were the Ferns employed to make a groundwork.

From Messrs. Dobbie and Co., Rothesay, came a nice collection of Pentstemons and Poppies. The former were a fine collection, and included some good forms. The best were Miss Willmott, Wm. Cuthbertson, Jas. Logan Ireland, Auguste Cain, Talma, Rachel, Mary Findlay, Joannis Chatin, and Tom Burnie. The best Poppies were Fiery Scarlet, Lævigatum, Ranunculi, flowered scarlet and white, rose, and white.

Messrs. W. Bull and Sons, King's Road, Chelsea, made a nice display of *Dracæna Victoria*, edged with Palms. The *Dracænas* were splendidly grown, the golden colour being bright and effective.

#### Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); and Messrs. H. Balderson, J. Cheal, H. Esling, S. Mortimer, H. J. Wright, J. Jacques, G. Norman, Jas. Smith, and Geo. Wythes.

Dr. Bonavia staged a basket of Sultanieh Grapes. They were small, and of very poor colour, but said to be sweet, and the best of the seedless varieties. Mr. Will Tayler, Osborne Nursery, Hampton, sent a dish of Peaches, called *Libra*, which were of good size. Considering they were grown in a cold house, with the exception of a little firing in March and April to keep out the frost, they have been grown quite cool. The variety appears promising.

#### Medal Awards.

FLORAL COMMITTEE.—Silver-gilt Flora for collection of *Nephrolepis* to Mr. H. B. May, Upper Edmonton; for group of *Hydrangea paniculata*, *Crinum Moorei*, and *Lilium lancifolium album*, to Messrs. Cuthbert and Son, Southgate. Silver-gilt Banksian for group of Cactaceous plants to Messrs. Cannell and Sons, Swanley. Silver-gilt Flora for group of cut shrubs and Dahlias to Messrs. Cheal and Sons, Crawley. Silver Banksian for group of Roses to Messrs. Paul and Sons, The Old Nurseries; for group of Pentstemons and Poppies to Messrs. Dobbie and Co., Orpington, Cheshunt; for group of *Dracænas* to Messrs. Bull and Sons, Chelsea.

#### Certificates and Awards of Merit.

*Cattleya gigas*, variety *White Queen* (W. P. Burkenshaw).—A large variety, having white sepals and petals, with a good lip, purple with yellow at the throat; blooms past their best. A.M.

*Cattleya Atalanta superba* (Jas. Veitch and Sons).—A cross between *C. guttata Leopoldi* and *C. Warszewiczii*. The sepals and petals are

rosy purple, while the lip is a deeper purple. An exceptionally fine variety. A.M.

*Gladioli Ellington Belle* (W. C. Bull).—A pale creamy form, large spike, and in good condition. A.M.

*Nephrolepis Piersoni* (H. B. May).—A fine form that will prove of exceptional value as a decorative plant. F.C.C.

*Peach Libra* (Mr. Will Tayler).—A seedling from Alexander; the fruits are large, with a slight flush on the sun side.

### Belfast Rose, July 24, 25 and 27.

The flower show in connection with the annual meeting of the North-East Agricultural Association, held on Friday, Saturday, and Monday, July 24, 25, and 27, on the grounds of the society at Balmoral, Belfast, contained some very fine exhibits of Roses, when one considers the recent severe thunderstorms experienced in the neighbourhood. As may be expected where a noted firm of rosarians were at home, the cream of the prizes in the nurserymen's classes for Roses were swept away by the noted Rose raisers, Messrs. Alex. Dickson and Sons, Ltd., of Newtownards, Belfast, and Dublin, who secured every first prize in the following classes, viz.: Class 1, seventy-two cut Roses, distinct varieties; class 2, 108 cut Roses in thirty-six distinct varieties, three blooms of each; class 3, twelve distinct Hybrid Teas; class 4, twelve yellow, any variety; class 5, twelve white; class 6, twelve crimson; class 7, twelve pink or rose colour; class 8, twelve new varieties, distinct; class 9, twenty-four distinct Tea or Noisette; class 10, thirty-six bunches of cut Roses, distinct varieties, not less than three trusses of each, Hybrid Perpetuals, except single flowered varieties excluded. The varieties exciting most admiration among the visitors to the show included the following: Mildred Grant, the winning exhibit in class 5, being an exceedingly fine lot; Her Majesty, Mrs. Edward Mawley, Triomphe de Caen, Oscar Cardel, Ulster, Bessie Brown, Duchess of Portland, &c. I noticed two very fine blooms of that lovely white Frau Karl Druschki, which seemed to catch nearly everyone's eye, and undoubtedly it deserves all the expressions of admiration lavished on it.

Messrs. Dickson's stand of bunched Roses was very striking, and included some very pretty seedlings, of which we shall no doubt see something in the future. Liberty, Killarney, and Mrs. W. J. Grant in bunches formed part of a most excellent exhibit. In the amateurs' section Mr. H. Vesey Machin, of Gatford Hill, secured a fair number of prizes, but was beaten in the class for twenty-four blooms by Dr. Campbell Hall, of Monaghan, who put up a fine stand, ousting the English amateur, who in previous years has generally won in this class. In the other classes Mr. Machin staged some magnificent lots.

Non-competitive exhibits were put up by Messrs. B. Hartland, Lough Nurseries, Cork, who showed some very fine blooms of single and double Begonias and single and double Geraniums. Messrs. A. Dickson and Sons, Ltd., a stand of herbaceous stuff. Mr. T. Smith, Daisy Hill Nursery, Newry, in a well arranged stand of herbaceous plants, showed some striking bunches of *Verbascum Chaixi*, *Spiraea lobata*, *Heuchera chrysoides*, *Silene orientalis*, *Cytisus elongatus*, and *Anthemis E. C. Buxton*. Some Pansies were exhibited by Mr. Thos. Hughes, Dalcloolin, Craigavad. A very successful show was the satisfactory result, concluding with a visit from Their Majesties the King and Queen on the last day.—OSWALD TREE.

### Bishop's Waltham, July 29th.

The annual exhibition was held in Swanmore Park by the kind permission of W. H. Myers, Esq., M.P., on Wednesday in last week, and was, from a horticultural point of view, a great success. The weather, though, was very bad, which must have militated against a satisfactory attendance.

Specimen stove and greenhouse plants, Ferns and table plants were best shown by Mr. F. Cawte, gardener to Mrs. C. Wyndham, Corhampton House. Begonias were quite a feature, so well were they staged, the premier award being won by Mr. Cooper, gardener to the Misses Gladstone, Hampton Hill, Swanmore. Cut flowers were staged numerous and well. For twelve distinct Mr. E. Ellwood, gardener to W. H. Myers, Esq., M.P., Swanmore Park, was first with a choice assortment of stove subjects. This exhibition also won the premier award for eighteen varieties hardy border flowers, with a nice assortment of Phlox, Campanulas, Delphiniums, Stenactis, &c. For six bunches Roses, distinct, he also staged a nice set, consisting of such varieties as *Gustave Regis*, *Crimson Rambler*, *Papa Gontier*, *Caroline Testout*. Sweet Peas and Carnations in bunches were numerous and good. For the best collection Mr. Cooper staged two dozen bunches of clean, bright flowers, and secured the coveted award. Mr. Ellwood won Mr. H. Eckford's prize for twelve bunches with a characteristic display of popular varieties. He also had the best Carnations well set up.

Table decoration was an undoubted feature of the show. Four competed in the open class for the best decorated table,

5ft by 3ft. Miss Molyneux, Swanmore Farm, was an easy first, with a charming arrangement of pink Carnations, Lily of the Valley, with Gypsophila, Smilax, &c., all lightly and tastefully displayed. Mr. Cooper was second with a pretty combination of two shades of yellow. Miss B. Dupuis, Summerlands, Curdrige, Botley, was third. In the class devoted to ladies only Miss Williams, Jervis Lodge, Swanmore, won with a tastefully arranged table. Miss Adnams second with *Plumbago capensis*, quite effectively displayed. Miss Williams also had the best arranged vase or epergne.

Fruit was numerous and good. Mr. Ellwood won for six dishes, staging Black Hamburgh Grapes, Pineapples, Nectarines, Melons, &c. Mr. J. Heath, gardener to Sir Nowell Salmon, Curdrige Grange, Botley, was second. The best two bunches of black Grapes were staged by Mr. Ellwood, really good samples of that popular Grape, Black Hamburgh. Mr. C. H. Holloway, gardener to Lord Aberdare, Longwood House, Winchester, was a close second, with *Madresfield Court*, only wanting a shade more colour to make them perfect.

Vegetables were numerous and good. No fewer than eight competed for eight dishes distinct for Messrs. Toogood's prizes. Mr. Holloway won with a capital collection of Potatoes, Onions, Carrots, Peas, and Tomatoes. Mr. Barnes, gardener to Mrs. Austin, The Thicketts, Bishop's Waltham, was second, with Mr. Cawte a close third. Mr. Ellwood won the premier award in the class where the prizes were provided by Messrs. Sutton with a collection of choice dishes. Mr. Barnes second, Mr. Cooper third.

### Boston, July 29th and 30th.

This exhibition, which has been continued over many years, was held in the People's Park, South End, Boston, the main approach to which is through a charming flower garden, admirably planted and kept, which reflects great credit to the gardener who keeps it in such excellent condition. The display held this year was universally acknowledged to be the best ever held in Boston. There was a good competition in most of the leading classes, while the contributions in the classes open to all, as well as from amateurs and cottagers, were remarkably good.

Groups arranged for effect were shown in the leading class for plants. They were arranged on spaces of 100 square feet, the first prize being taken by Messrs. Artindale and Son, nurserymen, Sheffield, who had a bright and pleasing arrangement of well-coloured foliage plants, nicely blended with flowering subjects. Mr. W. A. Hervey was second, with a well arranged group. Mr. Hervey came first with six stove and greenhouse plants. He had three good Palms, a Croton, and two good specimens of *Caladiums*. A second prize was awarded to Mr. Hervey. The best specimen stove and greenhouse plant in flower was a good piece of *Hoya carnosa* from Mr. H. Bothamley; the best foliage plant a fine Palm. Several excellent specimens of *Kentias* were staged in this class. Some very good Ferns were shown by Mr. W. A. Hervey, and awarded the first prize. *Coleus*, *Fuchsias*, *Zonal Pelargoniums*, *Gloxinias*, and table plants were shown in general good character.

Roses are a leading feature at Boston. With twenty-four blooms Messrs. G. and W. Burch, nurserymen, Peterborough, were placed first, their Hybrid Perpetuals being bright and good. Their leading blooms were Prince Arthur, Fisher Holmes, Comte Raimbaud, Liberty (H.T.), very bright; Duke of Fife, Horace Vernet, Bessie Brown, Charles Lefebvre, Her Majesty, Mrs. J. Laing, Helen Keller, La France, &c. Second, Mr. F. M. Bradley, nurseryman, Peterborough. With twelve Tea and Noisette Roses Messrs. G. and W. Burch were again placed first, and also with twelve blooms of Roses. Of the former they had Maman Cochet and its white form, Madame Lambard, Madame Hoste, Mrs. E. Mawley, &c., the blooms rather small, but fresh and clean. In their twelve the chief varieties were Her Majesty, Marchioness of Londonderry, Mrs. J. Laing, Star of Waltham, Dr. Andry, &c. Mr. F. M. Bradley was second.

Herbaceous and bulbous cut flowers were shown in good character. The best twenty-four bunches came from Messrs. Artindale and Sons, who had a very good assortment; Messrs. W. and J. Brown, nurserymen, Stamford, were second, and these firms held the same positions in the class for twelve bunches. Messrs. Artindale and Son had the best twelve bunches of stove and greenhouse cut flowers, staging *Anthurium Andreanum*, *Tuberoze*, *Lapageria alba*, *Ixora coccinea*, *Trachelium coeruleum*, &c.; Messrs. W. and J. Brown were second. Fine trusses of *Zonal Pelargoniums* were staged in the class for twelve, and creditable Sweet Peas were shown in the class for twenty-four bunches. There were good bunches of hardy annuals, but twenty-four distinct varieties is too many to ask for when the prizes are small. Carnations and Picotees, in twelve varieties, three blooms of each, made a good feature, some fine blooms of Fancy and yellow ground varieties being staged by Messrs. Artindale and Son, to whom the first prize was awarded. Chief among their blooms were Charles Martel,

Aleinous, Stanley Wrightson, Pantia Ralli, Mrs. E. Hambro', Perseus, Euryalus, and Alberta, a refined yellow ground Picotee. Mr. F. M. Bradley was second with good blooms, but unnamed. Herbaceous Phloxes and Pentstemons of good quality were shown, and Lilies also. There were classes for Dahlias, but only some Cactus varieties and Pompons were staged; it was too early to have them in good character.

There was a class for the most attractive trade exhibit, the society's silver medal and a money prize being offered. Messrs. Artindale and Son were again the winners, setting up a bold and attractive table group, having Palms and other foliaged plants at the back, wreaths, crosses, and other floral designs, various cut flowers, including some 150 blooms of Carnations. Messrs. W. and J. Brown, Stamford, and F. M. Bradley also had attractive groups.

In the way of floral decorations there were some pretty tables adorned with flowers, and, what is unusual, there were two classes for them, in one of which the exhibitors were married, and in the other single ladies; all the competitors acquitted themselves admirably. There was a valuable prize for a championship bouquet, which was won by Messrs. Perkins and Son, florists, Coventry, who had a most artistic shower bouquet, composed of white Orchids and Roses, Pan-cratiun, and appropriate foliage. The same firm was also first with a very handsome hand bouquet, Messrs. W. and J. Brown taking the first prizes with ladies' sprays and buttonholes.

In the division from which nurserymen were excluded some good Roses were shown by amateurs, also hardy herbaceous and bulbous flowers. Among these the brilliant *Tropæolum speciosum* was very conspicuous. It is said to do well in this district. Sweet Peas, annuals, Carnations, Dahlias, Delphiniums, &c., were all good features, and there were pretty combinations in wild flowers.

Some good fruit was staged. With a collection of not less than six dishes Mr. Barson, The Gardens, Hinchinbrook, Huntingdon, was first, having well finished Black Hamburgh and Gros Maroc Grapes, Peaches, Nectarines, Figs, Melons, &c. Mr. J. Drakes was second, with good fruit also; he had Muscat of Alexandria and Black Hamburgh Grapes, Peaches, Nectarines, &c. Mr. Barson came in first with black Grapes and also with white, and there were good Peaches and Nectarines, also Melons and bush fruits. Vegetables were shown in many classes, and their clean, smooth, and refined character demonstrated what good soil there is for the culture of vegetables about Boston, and what very fine stocks they grow.

The special prizes offered by Messrs. W. W. Johnson and Son for Sweet Peas, hardy annuals, and vegetables brought excellent exhibits, of vegetables especially, and there were very good collections staged in competition for the special prizes offered by Mr. Geo. Wood Ingram, seed grower, Boston. Miscellaneous collections of plants, flowers, and floral decorations were contributed by Messrs. Dolby Bros., Hope Nursery, Boston; John Haynes, Boston; W. H. Killingworth and Co., West End; A. W. Edwards, florist, Spalding; and H. H. Small and Co., Skirbeck, Boston.

### Prescot, July 30th.

For several years past the energetic committee of this useful society have met with rather severe reverses owing to inclement weather, but perseverance in the form of concerts, lectures, &c., during the winter months had enabled them to again hold their annual show. Lord Derby, with his usual kindness, had offered the society a new home, this time near the Eccleston Lodge entrance, a charming spot in every way. The exhibits throughout were of very fine quality, and an increase of some 100 over previous years. They were well staged, but in many instances unnamed, which is most misleading from an educational point and a loss to the general public who visited the show.

The open classes contained a capital assortment of plants, several new exhibitors putting in an appearance. The chief prize for a group arranged for effect had a substantial money addition to the valuable challenge vase presented by the Hon. Arthur Stanley, M.P., the winner proving to be Mr. J. George, gardener to T. Henshaw, Esq., Whitefield House, Roby, who wrested the vase from Mr. W. Lyon, gardener to A. Mackenzie Smith, Esq., Bolton Hey, Roby, last year's winner, with a group of high class plants, well arranged; a centre of *Cocos Weddelliana*, central mounds of *Crotons*, dot plants of *Oncidium flexuosum*, Roses, Caladiums, and Francoas, and a groundwork of Fern and *Panieu* were used most judiciously. Mr. H. Ogden, West Derby, and Mr. A. M. Smith were second and third respectively with plants of genuine quality.

Mr. J. Hare, gardener to G. H. Nisbett, Esq., Huyton, repeated his successes of the previous week at Huyton in stove and greenhouse plants, Fuchsias, and Caladiums. *Ixora Pilgrimi* was in excellent form from Mr. Smith, and a bold *Hydrangea* was noticeable in the four greenhouse plants from Mr. G. Osborne, gardener to Dr. Cooke, Tue Brook Villa. Mr. J.

Rose, gardener to Mrs. Kitchen, West Derby, gained a well deserved victory for Ferns, Coleus, and Lilliums. Three very charming Orchids came from L. Cookson, Esq., in which conspicuous was a handsome *Cattleya Mendeli*. Table plants from the same source were extra well coloured, and Gloxinias from Mr. Smith grand in every point.

Cut Roses form an attraction here, Mr. P. Greene, gardener to Col. T. Gee, Greenhill, Allerton, winning each of the three classes with superior flowers attractively staged, the better blooms being Gustave Piganeau, Baroness Rothschild, Caroline Testout, and Mrs. Sharman Crawford. Herbaceous flowers caused a great sensation, and were superb, Col. Gee and Mr. T. Henshaw being first and second. The Sweet Pea class was well fought out, Mr. Ogden and Mrs. Harding staging the best examples, but unnamed. Cactus Dahlias and Carnations were admirable from Dr. Cooke.

Fruit classes created much interest, so good were the samples. Mr. B. Ashton, gardener to Lord Lathom, Lathom House, Ormskirk, won the four dishes; Black Hamburgh Grapes and Royal George Peaches were excellent. Mr. McKelvie, gardener to J. Stone, Esq., Roby, a good second, and Mr. W. Oldham, gardener to J. Beecham, Esq., J.P., third. Mr. Beecham had the best Black Hamburghs. Mr. Gaunt, gardener to Peter Walker, Esq., West Derby, highly coloured Muscats; Mr. Stone the best Madresfield Court, and Mr. Beecham superb Buckland Sweetwater. Throughout the fruit classes Mr. Ashton was magnificent, winning for Nectarines, Cherries, Currants, and Raspberries; Mr. J. C. Gamble had Royal George as the leading Peaches, and Mr. Stone the best Melon.

Vegetables here are up to the highest standard, the silver medal and first prize falling to Mr. Ashton, with perfection stamped on every one. His three dishes of Tomatoes were Eclipse, Perfection, and Duke of York. The cottagers' section was more than maintained.

Messrs. Dicksons, Ltd., Chester, had a rich selection of Roses, and Mr. H. Middlehurst his well known Sweet Peas. Mr. W. Case, the young secretary, is to be greatly complimented for his work.—R. P. R.

### St. Ives, July 30th.

A society which has carried out an annual exhibition for the space of twenty-eight years has about it the elements of vitality, and in addition it is financially sound. But it had the untoward experience of a very stormy day, which it is to be feared prevented a large number from attending the show, though the weather improved somewhat towards the end of the day. The entries were unusually large, especially in the amateurs' and cottagers' classes; and they were up to the average in the open division. The soil about St. Ives must be greatly favourable to the production of quality of vegetables, and especially so in the case of Potatoes, Onions, Carrots, Peas, and Broad Beans. The competition was generally keen throughout, and the task of selecting the best dish of Peas from, say, twenty dishes of really good ones is not an easy matter. Judging was not completed until quite late, and notes of the show are necessarily brief.

The best group of plants in the open division, the space too limited to admit of much artistic taste being displayed, came from Mr. Barson, gardener to the Earl of Sandwich, Hinchinbrook, Huntingdon, who had a judicious mixture of flowering and foliage subjects. Mr. E. A. Ebsworth was second, and Mr. Johnson third. With six stove and greenhouse plants, three in flower, Mr. Ebsworth came first, and Mr. Barson second; the latter had the best foliage, but weak flowering plants. Mr. W. W. Warner had the best six Coleus, and he had the best plant in bloom, a good piece of *Hoya carnosus*; while Mr. Barson had the best foliage plant in a good Palm. Mr. Ebsworth took the first prize for six small but well grown Ferns. Cannas were going out of bloom. A leading feature was the Tuberous Begonias shown in sixes. There were three very good half dozens. Mr. G. D. Day was first, Mr. W. W. Warner second, and Mr. H. Goodman third. Gloxinias (six) from Mr. T. Lockie, gardener to A. J. Thornhill, Esq., Diddington, Huntingdon, were very good; Mr. H. Goodman was second; the latter had the best six Balsams; and Mr. Ebsworth the best six *Streptocarpus*. Mr. Barson was first with six table plants, and Mr. Lockie second, both remarkably good, and well suited to the purpose.

Cut Roses were as good as could be expected; Mr. C. Lamplough was first with twelve blooms, and Mr. R. M. Copley second. Gladiolus, in collections of six spikes, were shown by Messrs. Day and Goodman, the first named having the best. Mr. Day was also first, and Mr. Goodman second, with twelve varieties of annuals, some pretty well-grown subjects being staged. Mr. Lockie came in first with twelve varieties of stove and greenhouse cut flowers; Mr. H. Gilliat was second. Mr. Day was also first with twelve bunches of hardy flowers; good subjects were staged; Mr. H. Goodman was a close second. Sweet Peas were shown in two classes; one for twelve bunches, in which Mr. C. Lamplough was first, and Mr. H. Goodman second;

and the other for six bunches, in which Mr. Ebsworth was first, and Mr. H. Gilliat second. Zonal Pelargoniums, both double and single, and also Ivy-leaved varieties, were in good character; also Carnations in bunches.

Of floral decorations there were furnished tables 6ft. by 3ft., in which Mrs. Galloway was placed first, and Mrs. Ebsworth second. Hand bouquets, centrepieces, &c., were also shown, and children contributed pretty arrangements in wild flowers.

FRUIT.—There was a class for a collection, in which Mr. Barson gained the first prize for good Grapes, Peaches, &c.; Mr. H. Gilliat was second. Outdoor fruits were shown by amateurs and cottagers; the Cherries, Gooseberries, Currants, Raspberries, &c., were excellent.

Vegetables constituted a considerable part of the show; they were very fine in many instances from amateurs and cottagers; the competition good throughout. The quality of not a few of the dishes of Potatoes recalled the International Potato Exhibition of years ago.

Special prizes were offered for collections of vegetables by Messrs. Sutton and Sons, Reading, for six dishes, which Mr. Lockie won with Cauliflowers, Peas, Potatoes, Tomatoes, &c., all of very good quality; Mr. Barson was a close second, and Mr. H. Goodman third. Messrs. Webb and Sons, Stourbridge, also offered prizes for six dishes. Here Mr. Barson was first with a very good collection, and Mr. C. H. Coote second. The first of the special prizes offered by Messrs. Daniels Brothers, seedsmen, Norwich, was won by Mrs. Johnson. Messrs. Wood and Ingram (Jno. E. Perkins), Huntingdon, offered special prizes for eight of their novelties in vegetables. Mr. Lockie was first with excellent quality; Mr. G. Day second, and Mr. Goodman third.

Contributions not for competition came from Messrs. Wood and Ingram, who had Roses, charming cut Carnations, &c.; from Messrs. W. and J. Brown, Stamford and Peterborough, who had plants and cut flowers; from Mr. J. Wood Ingram, Huntingdon and St. Neots, who had various cut flowers of good quality; and from Messrs. G. and W. Burch, nurserymen, Peterborough, who sent some boxes of Roses.

### Basingstoke, August 3rd.

The twenty-seventh annual show was held in Golding's Park, and was in every respect a great success. In the plant classes there was a distinct improvement in several ways. Fruit was exceptionally fine for the season. Vegetables were not so numerous as in the past, but the quality was not in any way lacking. The classes set apart for ladies were, as usual, well filled, while great interest was, as usual, taken in the various items. Mr. Bonnington, as usual, had the secretarial details well in hand, so ably assisted as he is by an efficient committee of willing workers.

Plants were numerous and good. For nine specimens in or out of bloom Mr. W. Hunt, gardener to D. Moss, Esq., Fern Hill, Blackwater, Farnborough, secured the leading award with handsome plants of *Allamanda Hendersoni*, *Acalypha Sanderiana*, with at least twenty shoots each furnished freely with its showy blossoms; *Kentia Belmoreana*, *Alsophila excelsa*, and *Acalypha Macafeana*. Mr. J. Wasley, gardener to J. B. Taylor, Esq., Sherfield Manor, Basingstoke, second, with capital specimens of *Kentia Fosteriana*, *Microlepis hirta cristata*, and an exceedingly fine pot of *Lilium lancifolium album*. For four flowering plants Mr. Hunt was again successful, showing *Allamanda Hendersoni*, *Acalypha Sanderiana*, *Lilium lancifolium roseum*, and *Cassia corymbosa*. Mr. Wasley second. In the class for four foliage plants, distinct, Mr. Wasley secured the premier place with healthy medium-sized specimens of *Kentia Belmoreana*, *Adiantum Farleyense*, and *Woodwardia radicans*. Mr. Hunt second. Mr. Wasley staged a fine plant of *Kentia Fosteriana* for the premier position for one specimen foliage plant. Mr. W. Tamplin, gardener to W. R. Mitchell, Esq., Down Grange, Basingstoke, was second with the same variety, Mr. Hunt following with *Latania borbonica* in a healthy condition. Exotic Ferns were well shown. For six Mr. Wasley won with healthy examples of *Microlepis hirta cristata*, *Davallia bullata*, *D. Fijiensis*, *Adiantum Farleyense*, and *A. cardiophyllum*. Mr. Hunt second with *Adiantum cuneatum* and *gracillimum* in capital condition.

Coleus were exceedingly well staged. For four pyramids Mr. Best, gardener to F. D. Leyland, Esq., The Vyne, Basingstoke, was an easy first with highly coloured examples 5ft high. Mr. W. Green, gardener to S. E. Bates, Esq., Manydown Park, second. Fuchsias were grandly staged, which is an unusual feature nowadays. For four, Mr. T. Russell, gardener to R. Blencome, Esq., Shippets House, Basingstoke, was an easy first prize winner with plants fully 7ft high, quite shapely and grandly flowered, the varieties being *Rose of Castille*, *Elegans*, *Marginata*, and *Charming*. Mr. C. Kew, The Common, Basingstoke, second. Begonias, Caladiums, Liliiums, and Geraniums were well staged. Messrs. Hunt, Green, and Perry, gardener to C. J. Steevens, Esq., Sherborne House, were the principal prize takers. For a group of miscellaneous plants arranged in a half circle, 10ft by 7ft, there was but one entry, Mr. Best.

This was good in every respect, that the judges had no alternative but to award it first prize.

Cut flowers were numerous and good. For twenty-four Roses, distinct, Mr. Neville, gardener to F. W. Flight, Esq., Cornstiles, Twyford, Winchester, was an easy first with medium sized well coloured blooms; especially good were Alfred Colomb, A. K. Williams, Earl of Dufferin, Sir Rowland Hill, White Lady, and Le Havre. Mr. Hunt third, the second prize being withheld. For twelve Mr. Neville was also first, as well as for a dozen Tea-scented, staging really good blooms of *Caroline Testout*, *Charles Lefebvre*, *Comtesse de Ludre*, Mrs. M. Cochet, Anna Olivier, Catherine Mermet, and Mrs. E. Mawley. Carnations and Picotees were not numerous, but some were of excellent quality. For twelve Mr. Neville easily secured the leading award with beautifully finished blooms of Mrs. F. W. Flight, Mrs. B. Burdas, Alberta, Countess Verulam, Myrab, Gromow, Argosy, Amphion, Alcinos, and Guinersse. Mr. T. Tucker, gardener to Dr. Maples, Kingsclere, second. For Carnations in trusses of three Mr. Neville staged Gladys, Gromow, and Mrs. Burdas, and won easily. Mr. W. Tamplin second. For six bunches of Sweet Peas, distinct, Mr. C. W. Breadmore, Winchester won easily with Lady Ormsby Gore, Countess Cadogan, Duke of Westminster, and Dorothy Eckford as his best. Mr. S. Clifton, Winchester, second amongst five competitors.

Hardy herbaceous plants were a feature, as they always are here. For twelve distinct Mr. Hunt was first, staging huge bunches of *Pentstemon Newbury Gem*, *Platycodon grandiflorum album*, *Coreopsis Eldorado*, *Chrysanthemum maximum*, and *Aconitum napellus bicolor*. Mr. Wasley second, with Mr. Tamplin a good third.

Messrs. Ladhams, Shirley, Southampton, offered prizes for a collection of cut flowers grown out of doors. Here Mr. Hunt again secured the leading award with a distinctly creditable display of popular varieties, which well illustrated the value of this section of plants for cutting. Mr. Tamplin second. Mr. Wasley was first for twelve cut flowers, any kind distinct, *Ixora Williamsi*, *Allamanda Hendersoni*, *Gloriosa superba*, and *Bougainvillea glabra*. Mr. Hunt second.

Fruit was plentiful and good. For six dishes distinct Mr. Wasley was first, with very fine Madresfield Court Grapes, Hero of Lockinge Melon, Barrington Peaches, Rivers' Royal Orange Nectarines, Brown Turkey Figs, and Oullins Gage Plums. Mr. Hunt followed closely with capital Foster's Seedling Grapes and Rivers' Nectarines. For two bunches Black Hamburg Grapes Mr. Tamplin won first prize with medium sized bunches and berries capitally coloured. Messrs. Hunt and Green second and third respectively. In the class for two bunches, any other black Grape, Mr. Wasley, with huge bunches of Madresfield Court, requiring but a little more colour to make them perfect, won first place quite easily. Mr. Hunt, with Muscat Hamburg, was second; Mr. Best, with Gros Maroc, third. In the class for two bunches any Muscat Grape Mr. Wasley was again first with grandly berried bunches of Madresfield Court, Mr. Hunt second with Muscat Hamburg, Mr. Green third with Muscat of Alexandria. Melons were few in number but good in quality. Windsor Castle won for Mr. Tamplin first place in the green flesh section, Mr. Hunt occupying a similar position with Sutton's Scarlet in that division. Mr. Wasley, with Exquisite, won for a dish of Peaches, also for Nectarines, with Pineapple. Mr. Wasley also had the best three dishes of Plums, really good fruit of July Green Gage, Czar, and Angelina Burdett.

For Messrs. Sutton's prizes for six dishes of vegetables there were but two entries. Mr. Kneller, gardener to Sir Wyndham Portal, Malshanger Park, was an easy first with magnificent Perfection Tomatoes, Autumn Giant Cauliflowers, Intermediate Carrots, Sutton's Masterpiece Pea, Ailsa Craig Onion, and Adam's Glory Potato. Mr. Best was a good second. For eight varieties these two exhibitors occupied similar positions with similar produce.

For the best decorated table for six persons, open to ladies only, there was a spirited competition and a satisfactory display. Mrs. Thorne, Winchester Street, Basingstoke, won the premier award with an arrangement of mixed flowers quite elegantly arranged. Miss Nellie Wadmore, Brook House, Basingstoke, was second, with a rather heavy centrepiece, otherwise an elegant combination in pink, of Roses, Carnations, and Sweet Peas. Miss Ethel Middleton, Red Lion Hotel, Basingstoke, was third, with *Bougainvillea glabra* very prettily arranged. For the best arranged stand of wild flowers, grasses, and berries, Mrs. Thorne also won with a pleasing combination, not too heavily arranged. Mrs. W. C. Selby, Winchester Road, Basingstoke, second. Miss Kate Wadmore had the best pair of stands or vases arranged for table decoration. Mrs. Thorne second. Miss N. Wadmore was an easy first for a floral basket arranged for effect, really a charming display.

Non-competitive exhibits were numerous and interesting. Messrs. B. Ladhams, Ltd., Shirley, Southampton, had a capital selection of herbaceous flowers, consisting of *Gaillardias*, *Rudbeckia conspicua*, *Lobelia cardinalis*, Andrew Barlow Phloxes, and *Pentstemons* in variety. Amongst the latter were George

Home, Joseph Kent, Newbury Gem, James Hamilton, and Her Majesty. Mr. Maurice Priehard, Christchurch, had also a similar group, consisting of Inula Roezlei, Tritomas Rufus and Lemon Queen, Dianthus Napoleon III., Veronica subsessilis, and Gladioli in variety. Amongst the latter were fine spikes of Mrs. Beecher, Baron Joseph Hulot, a very fine rich purple; Lafayette, cream, with crimson throat; Bondon, and Com-mandant de Gerlache, blue. Mr. C. W. Breadmore, Winchester, had two dozen bunches Sweet Peas in popular varieties. Messrs. E. Hillier and Sons, Winchester, had Roses in quantity; especially good was Madame Abel Chateauay.

### West Derby, August 3rd.

In the midst of delightful weather this popular annual event was held in a field adjoining the vicarage kindly lent for the occasion by the rector, the Rev. Percy Stewart. At the luncheon presided over by the energetic chairman, Mr. C. A. Young, of the Floral Nurseries, the speeches delivered by Mr. Geo. Haigh and Mr. R. Pinnington dealt chiefly with the beneficial results accruing from allotments, and C. Crosthwaite, Esq., the esteemed hon. treasurer, fully supported the remarks, and spoke of the far reaching effects such shows had. The latter gentleman, by his standing in the neighbourhood, will, I feel sure, further the cause of the society very much, and with Mr. Rose and Mr. Young as colleagues a higher position is certain to be maintained.

The show itself was a tribute to this aristocratic neighbourhood, the groups especially denoting real improvement. The first position was worthily taken by Mr. G. Osborne, gardener to Dr. Cooke, with a high central mound and four corner ones beautifully furnished. Crotons of rich hues and a most judicious selection of flowering plants, and a cool groundwork almost composed entirely of Maidenhair Fern was refreshing. The second, from Mr. J. Knowles, gardener to Mrs. H. Bright, had charming light foliage effects and a capital foreground. Mr. H. Ogden a close third. Dr. Cooke had the lead with two foliage and flowering plants; Ixora Pilgrimi, Bougainvillea Sanderiana, and well coloured Crotons Chelsoni and Reidi, Allamanda nobilis (fine), and a huge Croton Chelsoni were his prize single specimens, his Liliun speciosum Melpomene being a show, and Palms healthy. Mrs. Bright showed choice table plants. Dr. Cooke led somewhat easily in H.P. and Tea Roses with Ulrich Brunner, Mrs. J. Laing, Catherine Mermet, Kaiserin Augusta Victoria, and The Bride in good form. Mr. J. Ashcroft, gardener to W. Leeming, Esq., easily led with Gladioli and Sweet Peas, and Dr. Cooke with a most useful lot of herbaceous flowers. Cactus Dahlias were moderate, and one regretted to see the almost entire absence of show and pompon varieties.

There was not a heavy competition in fruit, but a special word is due to Mr. Gaunt, gardener to J. Walker, Esq., for superb Muscats, and to Mr. Leeming for similar quality in Black Hamburgs and Buckland Sweetwater. A certificate was given to Mr. J. Skitt, gardener to Mrs. A. H. Bright, Knobby Ash, for enormous bunches of Black Hamburg.

Vegetables, notably the twelve distinct, showed the standard judges aim at every sample free from every trace of coarseness and age, Mr. J. Ashcroft winning with splendid Ailsa Craig Onions, Model Carrots, Duke of York Potatoes, Egyptian Beet, and Lyon Leeks. Dr. Cooke second with good Peas, Beans, and Potatoes. Mr. H. Spencer, gardener to A. H. Jones, Esq., first for six, ruined in appearance by untidy staging.

Under gardeners and cottagers made a record display, the highest marks of perfection were noticeable, particularly in the vegetables.

From R. F. Le Doux, Esq., Marlfield, came a most welcome table of Orchids composed of handsome forms of Odontoglossum crispum Harryanum and Kramerii, Tomatoes, Early York Peaches, and Lord Napier Nectarines. Mr. C. A. Young, Floral Nurseries, West Derby, is in addition to Carnations, specially dealing with Dahlias, and a certificate was granted for a beautiful arrangement in bamboo stands, with a background of Silver Accers.

The special prizes offered by Messrs. Fishlock Bros., florists, was won with a neat basket of Sweet Peas, but here, to give satisfaction to all exhibitors, the committee should certainly limit the size of the baskets.

During the afternoon the Earl and Countess of Sefton, Croxteth Hall, paid a visit to the show and evinced the greatest interest in the exhibits.—R. P. R.

### Leicester, August 4th and 5th.

The morning of the 4th opened at Abbey Park with every appearance of coming rain, and a slight shower happened just before noon. Happily, it was of very short duration. The weather broke beautifully fine soon after, and thousands of visitors wended their way to the park to see one of the finest displays ever seen in Leicester. One principal feature was the large number of trade exhibits, which furnished many varied and peculiarly interesting features. The Abbey Park was seen at its best; Mr. John Burn, the superintendent, does his

utmost to make the park attractive, as, indeed, he does in the case of all the open spaces he has under his control, and he succeeds in a remarkable degree. There are some features of gardening in the Abbey Park of a very high order of merit.

**PLANTS.**—Turning to the details of the exhibition, the principal class was for a group arranged for effect, covering a space of 160 feet, and here Mr. James Cypher took the first prize with one of those artistic and rich arrangements he is in the habit of setting up with so much skill. The beauty of the flowers employed harmonised well with the rich colouring of the foliated plants. Mr. Thompson, Little Over House, Derby, was second, and Mr. W. Finch, Coventry, third, both with attractive and well-finished groups. With six stove Mr. Finch was first; he had a very fine Ixora Williamsi, a Bougainvillea, and an Erica, a Palm, and two Crotons. Mr. H. Blakeway, gardener to Sir A. Muntz, Bart., was second; he had a good example of Allamanda Hendersoni, a Statice, &c. Mr. Blakeway was first with six exotic Ferns, staging good even, well-grown examples unnamed. Mr. H. Rogers, Gipsy Lane Nursery, Leicester, was second. The best plant in bloom was a fine Ixora Williamsi from Mr. Finch, and this had a silver medal awarded to it also.

**ROSES.**—Cut Roses came next in the order of the schedule, and deservedly so, for it is one of the leading features of the show. The best thirty-six blooms dissimilar came from Messrs. Alex. Dickson and Sons, Newtownards, Belfast, who had very fine blooms indeed, among them George Dickson, a grand new Irish Hybrid Tea, something of the colour of Liberty, but large, shell-petalled, full, and very fine; Duchess of Westminster, a highly promising new pale Rose; Le Duc de Morney, Mrs. J. Laing, Horace Vernet, Marchioness of Londonderry, J. S. Mill, Bessie Brown, Ulster, Her Majesty, Alfred Colomb, La France, Mildred Grant, Charles Lefebvre, &c. Messrs. D. and W. Croll, nurserymen, Dundee, were second, they having very good blooms of Horace Vernet, Bessie Brown, Caroline Testout, Mildred Grant, Frau Karl Druschki, Mrs. E. Mawley, Gustave Piganeau, Marchioness of Londonderry, Alice Lindsell, White Lady, Dr. Andry, &c. Messrs. Harkness and Co., Hitchin, were third. With twenty-four varieties Messrs. Dickson and Sons were again first. They had in very fine character Le Duc de Rohan, Helen Keller, Bessie Brown, Oscar Cordel, Captain Hayward, Alfred Colomb, Her Majesty, Mrs. J. Laing, Alan Cheales, Louis Van Houtte, Rosslyn, Alice Lindsell, &c. Second Mr. J. Barron, Leicester; and third Messrs. Harkness and Co. With twelve Teas and Noisettes Messrs. Dickson and Sons were once more first, having very fine blooms of Madame Jules Gravereau, Golden Gate, Lady Derby (new), Madame Vermorel, White Maman Cochet, Souvenir de S. A. Prince, and George Prince, a new Tea. Messrs. D. and W. Croll were second, and Messrs. Harkness and Co. third. With twelve blooms of one variety Messrs. Dickson and Sons led the way, having Mildred Grant in very fine character. Messrs. D. and W. Croll came second with Mrs. W. J. Grant, and Messrs. Jarman and Co., nurserymen, Chard, third, with Mrs. J. Laing. With twelve Teas, one variety, Messrs. Dickson and Sons again took the first prize with very fine blooms of Mrs. E. Mawley. Messrs. D. and W. Croll were second with the same variety, and Messrs. Harkness and Son third with White Maman Cochet. The best Rose in the show was the new H.T. George Dickson, shown by Messrs. Dickson and Sons.

Roses were also shown in a few classes by amateurs, and by gentlemen's gardeners. Some very creditable blooms were staged, but the crowded state of the tents, which were filled to overflowing as soon as they were opened to the public, prevented any notes from being taken. The principal prizewinners were Messrs. H. W. Machin, R. Parks, and the Rev. J. H. Pemberton. Mr. Machin had the best twelve blooms of one variety, staging White Maman Cochet (very good); Mr. R. Parks was second with Her Majesty.

Begonias, double, were very finely shown by Messrs. Blackmore and Langdon, Twerton Nursery, Bath, who had varieties of the highest quality. They took the first prize for twenty-four blooms and also for twenty-four singles, equally fine in development. Messrs. Jarman and Co. came in second with doubles, and Mr. C. Burditt, Great Bowden, third. Cut Begonias were also shown by amateurs, but they were of indifferent quality.

Carnations and Picotees were a very fine feature, especially the selfs and yellow grounds. With twelve flakes and bizarres Messrs. Thomson and Co., nurserymen, Birmingham, were first, having well developed blooms of Gordon Lewis, J. S. Hedderley, Master Fred, Robert Houlgrave, George Rudd, Guardsman, Merton, Sportsman, &c. Mr. A. R. Brown, Handsworth, Birmingham, was second, also with good blooms. With twelve selfs Mr. G. Rudd, Cotteridge, was first, having fine flowers of excellent varieties, but unnamed. Messrs. Thomson and Co. were a close second. They had in capital character Mrs. Eric Hambro', Lady Hermione, Sir Bevy's, Germania, Her Grace, Barras, &c.; third Mr. A. R. Brown. With twelve yellow

grounds Mr. Rudd was again first with large full blooms of Argosy, Pagan, Euryalus, Voltaire, Queen Bess, Hidalgo, Golden Eagle, &c. Messrs. Thomson and Co. were second, and Mr. A. R. Brown third. With twelve Picotees, white grounds, Messrs. Thomson and Co. were placed first and Mr. A. R. Brown second. There were classes also for the best bizarre, the best flake, also self and Picotee. In the amateurs' division, in which the competition was very good, Mr. J. Grumley was first with six Carnations and Mr. W. C. Baker was second. Mr. J. Grumley was first with six Picotees and Mr. H. Grumley second. With six yellow grounds Mr. J. Ward was first and Mr. H. Grumley second; and these two occupied similar positions with six self Carnations. With six bunches, six flowers of one variety in a bunch, Mr. H. Yeomans was first. There were classes also for single blooms, in which the competition was very keen.

Hardy annuals shown in bunches, one class being for twelve, made a pretty display. Mr. M. Firth was first with such things as Zinnias, Lavatera, Stocks, White Spiral Candytufts, Salpiglossis, &c. Mr. H. Blakeway had the best twelve bunches of stove and greenhouse cut flowers, staging in fine character Bougainvillea glabra, Eucharis amazonica, Gloxinia, Ixora, Tuberosa, Pancratium, &c. Zonal Pelargoniums were shown in bold trusses. Mr. J. Hudson was first. Mr. P. Newbold had the best six blooms of Fancy Pansies, and Mr. Hill the best twelve bunches of Violas, Mr. W. Wright being a close second. Messrs. Jarman and Co. were first with twelve Show or Fancy Dahlias, staging good blooms for the season. Mr. H. Frettingham had the best twelve blooms of Cactus Dahlias; Messrs. Jarman and Co. were second.

Messrs. W. and J. Brown, Stamford, were first with a hand bouquet, and Mr. H. Rogers second. Mr. H. Carnall, London Road, Leicester, had the best basket of cut flowers, several charming arrangements being shown.

Bunches of hardy herbaceous and bulbous flowers were very finely shown by Mr. W. B. Child, Acock's Green, Birmingham, who made a really grand display. They were also in fine character in other classes.

Fruit was remarkably good, and the judges in this department spoke highly of it. With eight dishes, Mr. J. H. Goodacre, The Gardens, Elvaston Castle, Derby, was first, having two bunches each of very fine Black Hamburg, Muscat of Alexandria, and Madresfield Court Grapes, Barrington Peaches, Elrue Nectarines, Figs, Melon, and a Queen Pine. Mr. J. Read, The Gardens, Bretby Park, Chesterfield, was second with Buckland Sweetwater and Black Hamburg Grapes, and other good subjects. Mr. J. Swanwick, Nottingham, was third. Mr. Goodacre was also first with eight dishes, including two varieties of Grapes, Pine excluded. He had Black Hamburg and White Muscat Grapes, Raymacker Peaches, Elrue Nectarines, Dr. Jules Guyot Pears and Lady Sudeley Apples, both very fine, Negro Largo Figs, &c. Mr. Read was again second. Mr. Goodacre had the best four varieties of Grapes, staging very good Madresfield Court, Black Hamburg, Muscat of Alexandria, and Muscat Hamburg Grapes. Mr. Read was second; his best bunches were Muscat of Alexandria and Madresfield Court. Mr. Goodacre was first with two highly finished bunches of Black Hamburg Grapes, and Mr. J. Swanwick was second. With two excellent bunches of white Muscat of Alexandria Mr. J. Goodacre was first, and Mr. J. Duncan, Bosworth Hall Gardens, Rugby, second. With any other black Grape but Black Hamburg Mr. Goodacre was first with two finely finished bunches of Muscat Hamburg. Mr. Duncan was second with Madresfield Court. Mr. H. Blakeway was first with six Peaches and also with six Nectarines, and Mr. J. Goodacre second in both classes. Melons were shown in two classes. Mr. Goodacre was first with Cherries in two classes. Gooseberries and other hardy fruits were also shown in their respective classes.

Mr. J. Hudson had the best collection of twelve dishes of vegetables, showing fine produce, and Mr. Read was second. Mr. Hudson was also first with two dishes of Potatoes. Peas, Vegetable Marrows, Onions, spring and autumn sown, Carrots, &c., were also shown in single dishes. In the cottagers' tent there was quite a display of cut flowers, hardy fruits, and vegetables, all generally of fine character.

The special prizes offered for vegetables by Messrs. Sutton and Sons, Reading, Harrison and Sons, Leicester, also for Sweet Peas, by Mr. R. Sydenham for Sweet Peas, by Mr. R. Pringle for vegetables, Messrs. Yarde and Co., Northampton, for Sweet Peas, &c., and others brought a variety of good exhibits.

Miscellaneous exhibits were dealt with in a liberal manner. Gold medals were awarded to Mr. W. Bentley, Leicester, for a very fine display of Roses tastefully set up in bunches; Messrs. Blackmore and Langdon, Bath, for an exceptionally fine collection of double and single Begonias; to Mr. W. B. Child, Acock's Green, for hardy flowers, forming a superb bank; to Messrs. W. and J. Brown, Stamford, for plants and flowers, Verbena Miss Willmott being in very fine character; and to Mr. F. M. Bradley, Peterborough, for decorative Sweet Peas, Carnations, &c. Silver medals were awarded to Messrs. Carnall, Holden,

Warner, Deverill, Pattinson, Harrison and Sons, Barron, The Ranelagh Nursery Co., E. Harris, and Mrs. Hodgkins, all for meritorious exhibits. Certificates of merit were awarded to Asparagus myriocladus, from the Ranelagh Nursery Co., Leamington; and to two new Sweet Peas from Messrs. W. W. Johnson and Son, Ltd., Boston, viz., Gladys Deal, a delicate blue-lavender, and Elfrida, creamy white striped with rose.

### Bristol Gardeners'.

By the kind invitation of the Rev. G. F. Whidborne, this society held its monthly meeting at the Priory, Westbury-on-Trym, on Thursday last. About sixty members were entertained to tea by Mr. Whidborne, after which the company were afforded the opportunity of viewing the picturesque grounds and greenhouses, so admirably kept under the able management of Mr. Whitlock, the head gardener. The visitors were much struck with the cleanliness of the garden, lawns and pleasure grounds alike being well kept, while the absence of weeds was remarkable. Notwithstanding the bad season, the summer bedding looked exceptionally well, while the visitors took special notice of several rows of Sweet Peas showing good bloom. The greenhouses, too, were much admired. Amongst the plants in bloom were noticed some beautiful Torenias, Anthuriums, Begonias, while several Orchids lent a charm to their appearance with Cattleyas, Dendrobiums, &c., in excellent condition. Probably the most interesting to the visitors was a corridor wall 100ft long and 30ft high, covered with Zonal Geraniums, which is certainly not a sight seen every day. These, planted some thirty years ago, have thrived wonderfully, and are now one mass of bloom, which would puzzle the artist to paint, while the trusses of bloom are exceedingly large.

After the visitors had feasted their eyes on this sight of sights, the members adjourned to a large room in the garden, and proceeded with their meeting, when Mr. J. T. Curtis, gardener to Mr. W. Howell Davis, read a most practical paper on the Eucharis, he being the successful competitor for the prize offered by Messrs. Parker and Sons for the best essay on the subject. He dealt in an able way with the cultivation of these useful plants, composts, watering, feeding alike having his careful attention. His paper was an excellent one, and on the motion of the Rev. G. F. Whidborne he was accorded the congratulations of the society and himself. Mr. Whidborne then presented five R.H.S. medals for five members for regular attendance. Mr. Ellis Groves then proposed a hearty vote of thanks to Mr. Whidborne for his great kindness and for the utmost interest he has taken in the society, which was heartily received. This brought to a close a most enjoyable evening. Prizes for two bouquets of hardy flowers were awarded to Messrs. Ambrose (first) and Coombs (second).—H. K.

### The Pith Moth.

(LAVERNA ATRA, Haw.)

Much damage is caused to fruit trees by the larvæ of the pith moth, but as the moth is not often seen, it is probable that few people are acquainted with it; although it occurs over a large area of England.

The damage done by the larvæ is particularly noticeable in nursery stock. They burrow up the terminal shoots and kill them, the result being deformed and stumpy trees. The attacked shoots flag and then die and turn brown, the dead masses varying from two to four inches in length. These dead shoots may remain for some time on the tree, or they may fall to the ground naturally, or be beaten off by heavy rain. The attack may readily be told from that of Red Bud Caterpillar by the absence of leaves spun together, and the absence of damaged buds and blossom; but the whole shoot dies away. Apple trees are chiefly attacked, but reports of its ravaging Pears have also been received. The larvæ are also found on Hawthorn and other wild Rosaceæ.

#### LIFE HISTORY.

This moth belongs to the group of small moths known as Tineinæ and to the genus Laverna. Its wing expanse is a little less than half an inch when fully expanded; the front wings are almost entirely black with white bars, but may be mottled with black, dark brown, and rusty brown; the hind wings are grey, and, like all Tineinæ, have long fringes. The head is almost entirely white. The colour is subject to much variation, some specimens being almost black. The moth appears in June according to Stainton, but all those that have been bred or observed appeared in July; and difference of locality no doubt accounts for a difference in the time of their appearance.

The eggs are apparently laid on the leaves; no definite observations have, however, been made. The larvæ feed first on the leaves; but, as winter approaches, and while they are still quite small, they bore just under the bark of a twig, or into the tip of a shoot, and remain there most of the winter. During January and February the larvæ tunnel right into the young shoots and

work up the pith (Fig E). In this tunnel the caterpillar lives until June; its presence does not prevent the leaves and blossom from unfolding, although later on they flag, turn brown, and die right off (Fig. B). These dead shoots if broken off will be found to contain the pith moth caterpillar or pupa, usually situated near the tip of a shoot.

The larva (G) is dull reddish-brown with a deep brown head and first segment; the other segments show more or less traces of pale brown spots, four in a row on the second and third segments, and four placed in a quadrangle on the remaining segments. The two front segments have two lateral spots, and the remainder a single lateral spot. The tip is deep brown. When mature the larvæ reach one-third of an inch in length and then pupate near the

be done, however, where small trees are attacked, and the attack is generally confined to such trees.

Late spraying with Paris green would probably prove beneficial, as it should kill the young larvæ, which seem to feed first of all on the leaves. The trees should be washed not less than four weeks before the fruit is gathered, but as soon as it is harvested a heavy spraying may be given. The time to spray, therefore, must depend on the variety of Apple concerned. This is certainly worth giving a fair trial, as beyond hand-picking nothing else can be suggested to check the increase of this pest, which has been so noticeable during the past few years.

Copies of the above in leaflet form may be obtained free of charge and post free on application to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. Letters of application so addressed need not be stamped.

## THE BEE-KEEPER.

### Re-Queening.

Success in bee-keeping depends largely upon good stock and plant, more particularly upon the former, and bee-keepers cannot fall into a greater error than that of tolerating old queens. It is all very well to harp upon the fact that it is only from the most powerful colonies that the best results are obtained, but the salient point is overlooked, i.e., that young prolific queens are essential to the production of such stocks. Every practised apiarist will admit that stimulative feeding in order to worry a failing queen to lay rapidly is utterly useless, as the bees will simply store the syrup in the brood nest, because the queen fails to respond to the stimulation and fill the cells with eggs. It is impossible to get a strong colony from a failing queen by any device. If a queen is laying well in the autumn of her second year, and has maintained a large population throughout the season, to purchase a queen to supersede her is apparently a nonsensical waste; but is it?

For 5s. or thereabouts a specially bred young and prolific queen may be bought in the autumn, and if she is introduced prior to feeding up for the winter she will generally fill the brood nest with eggs.

These are the bees which winter well, and the inhabitants of the hive being more numerous maintain the heat of the cluster better; consequently the consumption of food is reduced, and in proportion to the space the young bees can cover in the spring, so will the young queen lay eggs and extend the brood nest. The quantity of brood raised will be greater, the colony will thus be ready for supering earlier, and if there is sufficient food given in the autumn will not require feeding, and in most cases will yield double the quantity of honey. There is thus economy of labour and food, and the increased harvest pays for the queen over and over again.

On the other hand, if the old queen is left to pass the winter at the head of the colony, it often happens that, although she was accomplishing so much the previous year, she will not survive the winter. If she does, she will be found the following spring with a very meagre population, having been unequal to the task of rapid ovipositing in the early part of the year, and unfit for anything further. This can have but one result, viz., the loss of part, or all the season's honey; as the bees, finding the queen failing, naturally attempt to supersede her. In the meantime the population is rapidly dwindling away, having no hatching brood to replace the heavy mortality in the spring. Should the apiarist find out the state of things, he remedies it by purchasing a queen at a higher price than would have been the case the previous autumn, or the stock dies out altogether.

Now that it is understood why it is necessary to re-queen some colonies at least in an apiary each year, a little advice is necessary as to purchasing queens. The qualities of the different strains must not be overlooked, as breeding intensifies and concentrates good and bad points. The more observant will have formed an opinion as to what kind of bees they require, which will be the most profitable from all points of view. By procuring them from good breeders the best of stock can thus be obtained at a minimum cost. Most queen breeders, when asked, will give advice as to what kind they recommend. There is necessarily discrimination required in selecting queens and drones with reference to the qualities they possess, and which it is desired to perpetuate in the progeny.

It is by hybridisation and acclimatisation, or what Mr. Darwin calls natural selection, that we have undeniably improved our natives. Nature, however, does not produce the Durham ox or the racehorse; but science, by imitating Nature, may bring about similar modifications in bee life. The necessary qualities are uniformity of temper, energy, prolificacy, and hardiness.—E. E., Sandbach.

**The Pith Moth (*Laverna atra*).**

A, Moth (magnified, line showing natural size); B, attacked Apple shoot, the upper portion shrivelling up and dying away; C, processes on pupa (magnified); D, pupa (magnified) in a shoot; E, larva (natural size) in a shoot; F and G, larvæ (magnified).

apex of the shoot they have tunnelled. They reach their full-fed stage during the last two weeks in June.

The pupa (D) is of an ochreous hue; the head and front of the thorax and tip of the body mahogany red. It is cylindrical in form and about one-fourth of an inch long. On the under surface of the last segment but one are two blunt processes, separate and diverging outwards, hairy at their tips (Fig. C); the eyes are black and the wing cases and legs long, the former pointed. This stage lasts from two to three weeks, the moths emerging at the end of June or in July. The pupæ may sometimes be seen projecting from the dead shoots. Stainton says the larvæ also occur in Hawthorn berries in September, and that the black variety only is found in Apple shoots in February and March.

### PREVENTIVE MEASURES.

It is quite obvious that there can be no remedy for this pest, but much can be done in the way of prevention by hand-picking the dead shoots before the moths emerge in June. This can only

### Hardy Fruit Garden.

**STRAWBERRIES: PLANTING.**—Early rooted runners may now be transferred to permanent positions where they can soon take root and make progress, forming bold crowns by the close of the autumn, or the end of the growing period. These will thus stand a fair chance of fruiting well next season. This is the main object of early planting, but it cannot be achieved unless the runners have been specially prepared by taking them in hand some weeks since, and inducing them to root into small pots, from which they may be readily turned with a good ball of roots and soil, which should not be so pot-bound as to need much disturbance, other than loosening some of the lower rootlets. Previous to planting the soil must be kept moist; indeed, from the time of securing the runners on the soil surface, moisture must never be wanting. The ground must be well prepared by digging deeply and enriching with manure, well incorporated, finally making it firm previous to placing out the plants. Plant in rows not less than 2ft apart, the plants being 15in to 18in asunder. Insert them, if possible, when the surface soil is dry; the work is then carried out much more readily and the soil made firm about them. A few applications of water, as necessary, must be supplied until the plants are established.

**TREATMENT OF ESTABLISHED BEDS.**—Having made provision for securing all the runners required either by layering into small pots or into the soil between the rows, the rest should be regarded as superfluous, and the sooner they are cut off the better. With the presence of runners it is impossible to keep down weeds. The removal of both may be effected, thus affording plenty of light and air to the main plants, and the soil freed of growths, which tend to exhaust the nutriment in it. Beds of plants which have been longer than three years on the ground ought not to be retained. Spring planted beds ought to have the runners removed early.

**SUMMER PRUNING.**—Many fruit growers favour the present time rather than an earlier period for the work of shortening the side or foreright shoots of trained trees. The advantages of early August pruning are the more mature condition of the shoots, whereby, after the shortening, there is not the possibility of secondary growth from the lower buds. Should there be any it will take place from the upper buds, a length of shoot containing four to six leaves being left. The leading shoots of bush and pyramid trees must not have more than one-third removed. Bush and pyramid, wall and espalier Apples, Pears, and Plums may be dealt with. Besides shortening, summer pruning may consist of thinning out, for where shoots are crowded it is obviously of advantage to give relief by removing the least necessary. After crops of fruit have been gathered there will be on trees that bear fruit on the annual wood shoots to be dispensed with. These may usually be cut out, their place taken with successional shoots, while weakly or any for which room cannot be found may be cut out also. Peaches, Nectarines, and Morello Cherries may be dealt with in this manner. Sucker growth of any kind springing from the roots of wall or trees in the open must be cut out.

**THINNING FRUIT.**—The advantages following on the thinning of fruit are usually on the side of larger fruits of superior quality on the one hand, while on the other the trees are afforded a welcome relief from carrying an overburdening crop should they be at all old or tending to lessened vigour. The developing and perfecting of a crop of fruit tells largely upon all trees, and the aim of the grower must be to balance as equally as possible the production of healthy wood, at the same time benefiting the fruit. Trees or bushes in the first flush of vigour may be allowed to carry more fruit than an older specimen, because they are able to do justice to a larger number, and at the same time curb the exuberance of wood production. There is still time to lessen the number of fruits on all trees which ripen their crops in autumn. Stone fruits are especially benefited by judicious thinning, leaving, as a rule, one fruit to each square foot on Peaches and Nectarines. Heavy bunches of Plums should have the fruits reduced in number, while to have fine and well coloured Apples and Pears one fruit to a spur is sufficient. Ill-placed or deformed fruits should be noted at an early stage and removed.

**SUMMER THINNING RASPBERRIES.**—Raspberry stools usually produce a larger number of canes than it is desirable to retain. A selection, therefore, ought to be made of the most suitable young canes for future fruiting. Four to six will be found to be ample, these being of medium to strong vigour, the rest being cut out. The crop of fruit from the old canes

having also been gathered, these are of no further use, and must be removed. Short sucker growths round the stools fork out, but those at a distance away may remain, if canes are likely to be wanted for new plantations. At present train in no canes to the wires or stakes, as they will ripen much more readily by hanging free, so that sun and air can circulate among them.—EAST KENT.

### Fruit Forcing.

**CHERRY HOUSE.**—The trees are now ripe in wood and plump in bud. The leaves, too, will not be capable of much further effort in elaborating the sap and storing food in the adjacent buds and wood, therefore any undue excitement will cause the trees to start into growth, which must be guarded against by exposing the trees to atmospheric influence as far as the house will admit. The border must not be allowed to become dry, but have copious supplies of water, and if the trees are weak afford liquid manure. To subdue red spider give an occasional washing with the garden engine or syringe, but by all means remove the roof lights, the cleansing influence of rain and invigorating tendency of dew, with the thorough moistening of the border, having a beneficial effect. Black aphides are very troublesome on the young growths of Cherry trees, but the leaves and wood of this season, from their hard texture, are not inviting to them; yet if they appear promptly use tobacco water, the narcotic being fatal to these hard-to-be-killed insects. Cherry trees in pots are the most interesting of all fruits grown that way, and offer a variety and afford fruit over a long period, that it is remarkable they are not more generally grown. With slight forcing they ripen to fruit in May; in unheated houses the fruit ripens in June. Trees in pots must be regularly watered and syringed to maintain them in health.

**PEACHES AND NECTARINES: EARLIEST FORCED TREES.**—In houses started in December or January the trees will soon part with some of the foliage, but it must not be accelerated by the roots being deprived of moisture, for it is imperative that the soil be kept moist, yet not saturated. Dryness will cause the buds to drop, and soddenness of soil induce premature growth, both of which must be guarded against. As a safeguard against starting the buds, allow such lateral extension as is necessary to appropriate any excess of sap, a few green laterals doing that perfectly. Early forced trees do not usually make strong growths, and they form far too many blossom buds; therefore the pruning needs to be carefully performed, as many shoots are mainly studded with that description of buds, with wood buds at the base and extremity only, and it is necessary to retain a wood bud at the latter point, not cutting back next year's bearing wood unless the shoots are of great length, and then to a wood bud.

Where disbudding has been properly attended to, no more wood being retained than is required to replace the bearing shoots of the current year and to renew worn-out growths, as well as to supply the wood for extending the trees, very little pruning will be needed. Weakly trees require the smaller growths cut out, so as to impart more vigour to those retained, for the weak shoots afford much smaller fruit than the moderately vigorous and well-ripened growths. Some trees grow too vigorously, and must be lifted to induce a sturdy fruitful habit. Weakly trees should have the old soil carefully removed from amongst the roots, supplying loam of a calcareo-argillaceous nature. Give a good watering both to the lifted trees and to those that have had the soil renewed about the roots. These operations require to be performed as soon as the leaves are mature, and before they fall from the trees, syringing the latter and shading whilst the work is in progress, and for a few days afterwards if the weather is bright.

**SUCCESSION HOUSES.**—As the fruit is cleared from individual trees cut away the shoots that have borne fruit unless required for extension, and all the shoots where the growths are too crowded should be thinned. This will allow of cleansing operations being more effectively performed, it being imperative that the foliage be kept clean and healthy. With the free access of light and air the buds will form perfectly, and the wood ripen thoroughly, provided attention is given to a due supply of water at the roots. The house will need ventilation day and night, and where the roof lights are movable and the trees not very vigorous they may be removed when the buds are plumped. Where the fruit is ripening a free circulation of air will enhance the quality considerably, supplying sufficient water to keep the foliage in good condition, and securing air moisture by damping the paths and border in the morning and afternoon, as an arid atmosphere favours thrips and red spider and the premature ripening of the foliage. Dryness at the roots also favours these pests, tends to the fruit ripening unduly, and may render it mealy and flavourless. A slight shade is sometimes beneficial when the sun is powerful and the apex of the fruit fully exposed to its rays beneath large panes of glass, to prevent the fruit ripening too quickly and becoming discoloured at the apex, or when it ripens in excess of the demand. Ants are sometimes very troublesome on such fruits, especially Nec-

tarines, eating into the choicest at the apex. Poisons are not safe to use at such times. The only suitable means of riddance is to take small pieces of dry sponge between the fingers and dip them thus held in treacle, relaxing the pressure so that this will be absorbed by the sponge, then remove and with a gentle squeeze free the sponge of the excess treacle, placing the bowls or saucers level with the edge in the soil in their runs, or near their haunts; and when the ants are feeding lift and drop the sponge into boiling water. Another plan is to place some partially picked bones, such as come from table, in their haunts, and when they are feeding on the meat place them in boiling water. The bait should be dried before using again, and this persisted in will soon clear a house of the ants.

LATE HOUSES.—The wood should be laid on thinner than is customary with trees in earlier houses, so as to give it a better chance to ripen, and the foliage advantage to assimilate food and store it in the wood; whilst the buds are perfectly formed. Attend, therefore, to thinning and regulating the growths. Gross shoots tend to impoverish the weaker, appropriate an undue amount of sap, prevent an equal distribution of the nutriment, and are seldom fruitful. They mostly fall a prey to gum disease, and are best removed in favour of less exuberant growths, striving to secure an even spread of moderately strong short jointed wood. Ventilate freely in the early part of the day; allow a good heat from the sun during the day, and close in good time, so as to run to 85deg or even 90deg. This will only be necessary where the fruit is required accelerated in ripening. Sun heat will not do any harm after evaporation has been going on for some time, but it is desirable to admit a little air before nightfall, to allow the pent up moisture to escape, and the gradual cooling of the house will insure rest. Early ventilation and consequent elaboration of the sap is necessary for the solidification of the growths. Forcible syringings will keep the trees free from red spider, and should be continued until the fruit commences to ripen. Keep the borders well, but not excessively, supplied with water or liquid manure, mulching the surface with short sweetened manure.—ST. ALBANS.

Meteorological Observations at Chiswick.

From July 19th to 25th. a week of dull weather, with rain on six days; and also from the 26th to August 1st. the weather has been dull and cool, with rain on six days. Total rainfall for July, 3.95 inches.

Trade Catalogues Received.

T. Methven and Sons, Leith Walk, Edinburgh.—Bulbs.  
John Peed and Son, West Norwood, London.—Bulbs.

TRADE NOTICE.—The contract for supplying the whole of the parks and cemeteries of Bradford with bulbs, forcing plants, herbaceous plants, sundries, &c., for the ensuing twelve months has been given to Mr. F. C. Edwards, nurseryman and seedsman, Leeds.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

GRUBS ON STALKS AND ROOTS OF CABBAGES (N. H. S.).—The reply to your query will be found on page 121.

DURATION OF FRENCH RANUNCULUS (Hortus).—The roots will endure indefinitely if taken up as soon as the leaves ripen and turn yellow after flowering is over, drying and storing away in a dry airy compartment, in drawers, or suspended in paper bags until planting time again arrives. This is best done towards the end of February, should the weather permit, and being properly planted and well attended to, there is practically no limit to the duration of the roots, the plants being given fresh soil or new beds from time to time.

PEACHES AND NECTARINES FALLING OFF (E. G.).—The two fruits each of Peach and Nectarine have been east through defective stoning. Though the stone in all the four samples was completely formed and hard, the kernels were very small, shrunk, and defective, and this is the real cause of the fruit falling off. One of the Nectarines had also split, a matter that has not been satisfactorily explained, being attributed to imperfect fertilisation, which is somewhat confirmed by the defective state of the kernels, which are devoid of embryos; hence, useless as means of continuation by seed, this being Nature's definite law, not man's sole or chief concern about flesh. The best aids to avoiding stone splitting and casting of the fruit in stoning, or at its should-be completion, is carefully lifting the trees and replanting them in rather strong loam, to which has been added a sixth of old mortar rubbish, keeping the roots well up to the surface, and making the soil firm under, about, and over them. This should be done as soon as the leaves give indications of falling, and done carefully. The trees not being very old, this will not prejudice the next year's crop. It would also be well to have recourse to fertilising the blossoms, especially cross-fertilisation.

TOMATOES NOT SWELLING (J. C.).—The fruits, a quarter to half-swelled, are seedless, which is the only cause of their not swelling that we can discover. In the United States it is said that Tomato cultivators have succeeded in growing Tomatoes without seeds, greatly to the increase of the quality of the fruit in sugar, and as a safeguard against appendicitis; but if like yours we question their utility, and it is difficult to see how the supply of plants is to be maintained. All the fruits in your case are without evidence of seed, and to insure their further swelling it is likely that phosphate of potash, ½oz to a gallon of water, would be the most serviceable, increasing as we suspect the quantity and quality of the fruit. This may be supplemented about once a week with nitrate of soda, ½oz to a gallon of water, or the two substances may be used together in the proportion of three parts phosphate of potash and one part nitrate of soda, using ½oz. of the mixture per gallon of water. Or form a mixture of three parts superphosphate, one part sulphate of potash, and half a part nitrate of soda, using ½ to 1oz of the mixture to a gallon of water. In order to have the fruit swell properly, it would be advisable to carefully fertilise the blossom, having recourse to cross-fertilisation in order to effect thorough fecundation.

USING KAINIT, SUPERPHOSPHATE OF LIME, AND NITRATE OF SODA FOR CELERY, CHRYSANTHEMUMS, AND VINES (F. L., Hants).—It is not, as a rule, advisable to use kainit during the growth of the plant, but is best mixed with an equal proportion of superphosphate, and applied some time in advance of cropping, or in autumn for Vines and fruit trees, following with nitrate of soda in the spring, or when the plants are starting into growth. Of the mixture of superphosphate and kainit 3½lb may be applied per rod, and dug in in autumn or early spring, and after the sown or set plants are up or established, or fruit trees starting into growth, apply finely crushed nitrate of soda at the rate of 1½lb per rod. As you have used farmyard manure for the Celery, you may sprinkle nitrate of soda alongside of the plants, not over them, in the trenches, about ½oz per yard run of trench, and repeat this occasionally, say at intervals of three weeks up to the time of first earthing. For the Chrysanthemums you may use the nitrate of soda in liquid form not stronger than ½oz to a gallon of water, and not applying oftener than once a week, commencing after the bloom buds have been thinned, not before. For the Vines it may be supplied also in liquid form and weak, as an aid to swelling of the Grapes; but the value of nitrate of soda is proportionate to the amount of phosphoric and potassic elements present in the soil in available form. If the kainit be of good quality you may form a useful mixture for most crops of three parts superphosphate, two parts kainit, and one part nitrate of soda, not applying more of the mixture than 4oz per square yard.

**WISTARIA DYING** (An Old Subscriber).—It is rather uncommon for large plants of this very handsome climbing deciduous shrub to die off; but they are sometimes attacked on the stem and at the roots with a cankerous affection not unlike canker in Apple trees, which girdles the stem, and the top, in consequence, collapses. Probably the disease is caused by the fungus gaining access through a wound, and then lives in the tissues between the bark and wood, and gradually extends circumferentially and girdles the stem or limb, and the part above collapses. A similar disease also attacks Virginian Creeper, but in the case of both Wistaria and that plant the occurrence is not common, there being very fine examples extant that are much older than thirty years, and covering very large areas of wall. Probably, if you examine the rootstock, you will find evidence of the cause of the mischief.

**TOMATOES DECAYED** (H. J. K.).—The fruits are affected by the Tomato rot (*Macrosporium tomato*), the fungus being often extremely destructive, both under glass and outdoors. The disease is usually first noticeable when the fruit is about half-grown, and commonly appears at the blossom end as a small blackish spot, though the disease appears in bad cases, such as yours, at the sides and almost all over the fruit. The tissues beneath the spot or spots are destroyed by the fungus, so that the affected parts become depressed or sunken, and the inside of the Tomato is blackened. The disease, in this instance, is evidently caused by spores that alight upon the fruit, the germ-tubes of the fungus penetrating through the skin, and the mycelium forming in the flesh. In many cases the infection can be traced to the blossom, the spores of the fungus alighting upon the bloom, either when expanded or after it has faded, and in the dead tissue the mycelium forms and spreads to the fruit. Doubtless the disease is favoured by the decayed bloom being left sticking upon the fruit, where spores are probably produced, and these find a favourable medium for germination in the moisture of the atmosphere condensed upon the fruit, as frequently happens from a rise in the temperature of the house after a cold night, air not being given sufficiently early to allow of its disposition before the sun acts powerfully on the houses. This moisture is unquestionably a contributory cause of black spot, as excess of moisture in the house favours the germination of the fungoid spores. The removal of the dead blooms from the fruit is a great help in preventing the disease, the bloom dropping readily the day after it has faded by tapping the plant, or its support, or the footstalk of the fruit, admitting air freely and maintaining a genial warmth in the hot-water pipes, keeping water from the fruit. All diseased fruits should be collected and burned, and to prevent further mischief the plants may be sprayed with potassium sulphide solution, 1oz of the sulphide to 3 gallons of water, in which 1oz softsoap has been dissolved, repeating at intervals of ten days or a fortnight.

**NAME OF FRUIT.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (H. D.).—Scarlet Golden Pippin.

## Notes.

In considering the events of the past week several topics present themselves to us as being of more or less interest to the farming community. Since St. Swithin came in we have had rather more than our share of rain. There are no little Apples this year ready for christening, and we can only lament that this good growing forcing season is of no interest to us who have Plum or Apple orchards. For the Raspberries the rain came too late, and now, just when we wish to gather, the small berries are saturated with moisture.

The belated haymakers have but a sorry prospect, and their expenses will be heavy and the value of their crop is lessened, so that they are losers all round. Professor Wrighton has had a high old time. Listen to what he says of doings at Downton: "Twenty days hay carting without any interruption from weather is an extraordinary achievement, but was accomplished this extraordinary year. Much of the hay was secured without a drop of rain, and only suffered, if at all, from being rather too dry. The bulk of the crop is uniformly heavy, and probably averages 1½ tons per acre." Whatever the Professor's feelings may be, we are thankful we are not responsible for the safe ingathering of nearly 200 acres of hay—i.e., grass and Clover. What the wear and tear must be in a catchy season is not calculable.

This droppy weather is all in favour of the Turnip crop, so we may hope to see plenty of good keep to land us through the winter months.

As reports come in from one part and another, it is curious to note how in the small area of this island the weather has varied in such a remarkable degree: floods here, drought or nearly so there; but whatever else has been irregular, cold nights have been pretty universal. We almost think we have got about enough rain for the Potatoes. These smudgy days are exceedingly favourable to baneful growths, and more than one up-to-date grower (we do not mean of that Potato in particular) has been busy with the sprayer. The Potato sprayer seems to have come to stay. We do not hear much now of spraying Charlock. The results were so divergent and the cost was apt to mount up. Charlock is tough stuff to deal with, and we still hold the belief of our younger days that nothing beats hand pulling; but where are the women and children? Yes, and this lack of children is blamed for another evil, the increase of the sparrow pest—no time for bird-nesting, all

time in school. At any rate, the birds have multiplied to an alarming extent, and one has only to visit any cornfields of early variety or contiguous to a village or homestead to see the utter ruin that sparrows will cause in a very short time. One farmer writes to the local press urging that some measures (stern ones) be taken for their extermination, but considers this a case for co-operation; all parishes in a district must unite. We are not quite sure of this ourselves, as we are doubtful if the sparrow is a migratory bird. We do not mean by this a summer visitant. We wonder if any naturalist can tell us how far a sparrow will go in search of food; we have never heard the question raised. Of sparrows in relation to the small fruit crops, we know of two gardens not a mile apart, where in one the trees, unprotected by wire, are absolutely bare of fruit, and in the other, under an immense cage, the fruit can be estimated by the stone. According to some authorities, the protected trees should be covered with filth, i.e., caterpillars and so forth. So far from this being the case (not only this year, but for many past), the trees are as clean and healthy and free from insect pests as possible. This goes a long way to prove that as insect eaters sparrows are a great fraud.

We are beginning to hope that this year will see us with a plethora of straw, a most comfortable and pleasing state of things. An old farmer, a man of many acres and great experience, was telling us last week that the lack of straw was the real reason of the outcry for allotments among the working men. It was not the extra work they wanted, but it was the comfort of clean bedding for pig and possible cow, and for the safe housing of their Potato crop. It had been his plan to give straw freely, and his labourers were not men who were for ever crying for a bit of the moon or its equivalent in the shape of the best field in the lordship.

We have just looked over the returns (Government) as they affect allotments and small holdings. A good many of us can remember what a stew there was when these Acts became law—how they were going to solve the great problem of "back to the land." How no man who was wishful for an acre or two should sigh in vain. How intensive agriculture was to be the fashion, and what a vast impetus would be given to the fruit, vegetable, and poultry industries. There was also another side to the picture, namely, the discomfiture of land-holders when compelled to "stand and deliver" their best and nearest (to the village) close. We remember the situation was very acute in our own village, where one John Hampden set his mind on two particularly good fields, quite the pick of the farm in which they were included. Party feeling ran high. That particular farmer was not popular, and we fear there was more than a latent hope that he would have to disgorge. However, moderate counsels prevailed, and a close of school land was eventually set aside for the purpose of further allotments, and the grumbler ceased from troubling. We may add, after all the pother several of the allotments were for a long time tenantless, and then were only cultivated by pluralists, just bringing about the same wicked state of aggrandisement with which the large farmers had been charged! Can we accept five years as a long enough period in which to test a movement? We think we fairly may do so, and when, therefore, we turn to the report and learn that during five years about 3,783 acres have been acquired for allotments out of all the broad acres of England and Wales, we begin to wonder why all the commotion was made.

The number of local authorities who took action for providing allotments was 324; the claims were allocated thus: Bedfordshire, 56; Berks, 4; Bucks, 178; Cambridge, 30; Cornwall, 27; Cumberland, 5; Devon, 77; Dorset, 123; Ely, 165; Essex, 51; Gloucester, 40; Hereford, 4; Hertford, 103; Kent, 61; Leicester, 24; Lincoln, 234; Middlesex, 82; Norfolk, 783; Northampton, 16; Oxford, 41; Shropshire, 9; Somerset, 88; Southampton, 122; Suffolk, E., 112; Suffolk, W., 7; Surrey, 57; Sussex, E., 20; Sussex, W., 24; Warwick, 52; Wilts, 119; Worcester, 131; Yorks, 212. We are surprised at the place Norfolk takes on the list as first. Possibly this is owing to the fact that the land is really most suitable for small cultivators, fairly light, and easily worked. We are surprised to see so small an acreage in Cambridge and Cornwall, for we thought both these counties were peculiarly adapted for the cultivation of Potatoes and flowering bulbs, both of which meet with ready sales. The land acquired for small holdings during the same five years is just 100 acres (!), of which

Lincoln (Holland division) takes 46; Sussex, 42; Plumstead, 8; Bristol, 4.

Local authorities have also acquired land for burial grounds, recreation grounds, and sewage farms up to 710 acres. We do not for a moment say the Act is unnecessary, but we do say we expected to see greater results. We heard only to-day of certain allotments belonging to the Dean and Chapter of —, which for years and years have been entirely devoted to the cultivation of Leeks. The rivalry is something tremendous, and so are the Leeks, and the growers are kept up to the mark by annual exhibitions, where honours are dearly sought.

Just in this immediate neighbourhood our allotment holders are more for Potatoes than any other product, and are most enterprising in their endeavours to get good new varieties, and they expect to pay, and do pay, some very stiff prices for a novelty. One novelty, an expensive one, has proved its value in rather an unexpected way. On June 29 a very sharp frost visited this district, and all Potatoes save this one were blackened. It is to be hoped we shall not often have a frost so late as the end of June, but really nowadays the most unexpected things do happen. The mercury in the thermometer jumps up and down the tube as if bewitched. We had far warmer days last January than we had in April and May, and the frost that failed us at Christmas comes to us in June.

We notice some wise man has been suggesting that the Scottish deer forests should, in the face of our growing demands for meat, be again devoted to sheep and cattle. We fear if every deer forest were at once stocked with sheep there would be no very perceptible fall in the price of mutton. As deer forests, we are inclined to believe these practically sterile tracts of country are the cause of a very much larger circulation of the current coin of the realm than ever they were under the old régime.

There is just one other point: the Board of Agriculture is in the habit of publishing from time to time leaflets that treat of matters of moment. These leaflets are gratuitously distributed, but who gets them? We fear not the people who most need them. We doubt if the average small farmer knows of their very existence. Occasional mention is made of them in the columns of the local weekly paper, but we never see them in the homes of small occupiers. Could not some better means of distribution be devised?

### Work on the Home Farm.

We have been very fortunate to have got all our hay so well, for the weather is now thoroughly broken, heavy rain falling every day. Already the mown fields have assumed a green hue, and in many of them the aftermath has made considerable growth.

The root crops are romping away so quickly that the hoes can hardly keep pace with them. Weeds have been very difficult to kill, the land is so moist, and both weeds and small Turnips are far too numerous between the rows. There will be a good deal of horsehoeing before they can all be wiped out. Big weeds and Turnips, too, are very tenacious of life in showery weather. The rain is favourable to Turnips and Potatoes, but the best crops of corn are having sadly too much of it. Up to a week ago very little laid corn was to be seen, and the string binders were promised an easy task, but there has been a great alteration, and much Barley, as well as Wheat, is laid flat. Fortunately, it is not twisted about, but is laid nearly all one way, which will make reaping easier.

We are glad to see that the Sheep Scab Bill has passed through committee. A systematic and compulsory system of dipping is the only means whereby we can get rid of the scab. Outbreaks almost invariably originate where farmers are too shortsighted, and mean to spend money on reasonable safeguards. This is a sheep district, and dipping is seldom neglected. At the present date sheep which have not been recently dipped would be very difficult to find in farmers' hands. Not so with butchers and cattle dealers, who are very negligent. We know a butcher who leaves his sheep unseen for a week together. Such a man would never think of dipping.

As calving cows are not desirable articles about May day, the bull which has been grazing with the cows and heifers should now be brought up, and put in a small yard or loose box. There are plenty of Tares and Clover for him, and he will be fed on those green foods for the present.

Harvest will be very near in a fortnight, but there is plenty of time to get the harness and gearing looked over and repairs made good. Saddles, pads, and collars should be attended to, for it is bad management to have a necessary repair pointed out by a sore shoulder or back.

## Window Gardening.

WINDOW gardening as practised by the cottager is certainly conducive to real enjoyment. There is something pleasant and cheering in the sight that speaks of a thoughtful appreciation of objects of interest, and shows that amid the cares of daily life some little attention can be given to pets that vary the occupation of the day, as well as afford some little gratification as the result of successful manipulation. But when we come to think of the inhabitants of the close courts and narrow streets of crowded cities trying to emulate the cottager in this respect—and not only trying, but actually succeeding, in growing plants and flowers about their squalid homes, where every circumstance is as little favourable to the design as can well be imagined, it certainly looks as if the love of flowers were inherent in human nature, and too strong to be resisted under any circumstances. From what I have actually seen I know that window gardening is carried on to a large extent in some of the most densely populated parts of London, but should never have thought that there were exhibition plants grown in such places; but there is no disputing what has been done, and my only object now is to offer a few suggestions which may or may not be of use.

As a gardener, I have occasionally had to deal with men who were sent from various workshops of London—men that usually inhabit the crowded dwellings of the metropolis. Most of them, when thus sent into the country to build new houses or do up old ones, leave wives and families, mothers and sisters, in their homes in the crowded thoroughfares, to whom they return once a week; and if they can but get a small plant or two, a few cuttings, or a bunch of flowers to take with them, they are delighted beyond measure. I have

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

frequently by this means diffused as much pleasure among a number of workmen as though I had done them the greatest service in the world. There are those who would demur at thus giving away plants when there are many who have to get their living by selling them. But in reality it is a help to the trade; for by this means the foundation is laid for a love of flowers. Those who have had them once will not like to be without them, and will purchase many a plant in order to keep up the supply, especially when they have gained a slight knowledge of the way in which they should be managed. The gift of a piece of a Cactus, a few rooted pieces of Chrysanthemums, or a few offsets of any herbaceous plants are carried home with delight. And where is the garden where such would be deemed any loss? Thousands of slips and cuttings are annually thrown away; many gardeners prefer doing so to giving them away, even to the poor cottager, on the excuse that it is hurtful to trade. The sooner they are disabused of such reasoning the better, since the contrary is actually the case.

But what I have chiefly to suggest is, that some attention be paid to the kind of plants most suitable and best adapted to be grown in close courts and smoky thoroughfares. It is evident that all plants will not do alike, nor is it possible that plants will ever be grown in such localities as are shown in all the prime of perfect beauty at first-class flower shows. Specimen Heaths, Azaleas, and New Holland plants can never be grown on window ledges; and those plants that can be must necessarily be limited in number, for the reason that those who have the management of them are not experienced growers. In the hands of experienced cultivators very many plants are capable of being brought to a certain stage of perfection by window culture, but the chances are reduced in proportion to the unfavourable condition of the locality. Where it may be easy work in the country, it becomes difficult in the midst of dust, smoke, and draught, even in practised hands.

What, then, must be the difficulty with those who know little or nothing about the matter? I have often been shown a sooty-looking plant and been asked the cause of its present condition, why the leaves fall off prematurely, why it does not flower, and so on. In ten cases out of twelve the plant happened to be a scarlet Pelargonium, a plant little adapted to grow in a dusty place, the downy surface of the leaf being favourable to the lodgment of dust. A glance at the plant showed that the pores of the leaves were stopped and could not perform their functions, that the operation of potting was by no means properly understood, and that it was tortured to the extreme by being made to stand in water, and being subjected to a daily dose of the same whether it liked it or not. It is scarcely to be expected that such florists are going to exhibit good specimens of Pelargoniums, or compete with country growers. But even with such a beginning, knowledge may increase with experience, and practice may point out the best plants to grow, and the best method of growing them. It is too much to say that perfection has been attained when Ivy has been grown in an old box and trained over the window, or that Mustard and Cress has been grown in an old colander.

The Chrysanthemum is not of the most smooth-leaved plants, yet its adaptability to town culture is well known and fully established; and even the Pelargonium under fair treatment may present a creditable appearance. The Fuchsia and the Genista are rather smooth-leaved, and are very good town plants. The Pentstemon is sure to do well; and I think a great deal might be said for plants of ornamental foliage, especially the smooth-leaved ones, as *Farugium grande*. But, again, I think the chief dependence ought to be placed on herbaceous plants of close habit, which make very neat pot plants. How I should like to see some town grower giving all his spare time and attention to a collection of Saxifrages, than which nothing can be prettier or neater, or even better adapted for the purpose. And why not the commonest among them—the London Pride (*Saxifraga umbrosa*), a plant well adapted to spread over pots and boxes, hanging down and making a verdurous appearance on a window-sill? The Sedums and Sempervivums are both excellent subjects for town culture—that is, if a proper selection of them be made—the common Stonecrop and the common Houseleek, a sample of each often grows luxuriantly on the housetop and the window-sill. *Campanula pumila*, Alyssums, Arabis, Vincas, and Auriculas might be added to the list. Indeed, I have known the latter grown, if not to perfection, at least

very creditably at a garret window; and what has been done before may be done again, for the person who grew them knew very little of plants or plant-cultivation generally.

The advantages of having plants with hard or smooth leaves is that they are kept clean with very little trouble, as a sponging now and then will accomplish it, and does no injury; and that of ordinary herbaceous plants, that they are less subject to be infested with aphides or other pests, and when grown in the midst of town smoke they are not likely to be eaten by caterpillars or slugs, as such pests are not likely to travel so far out of their way in quest of food. There are still other plants that possess a wonderful property of resisting all the attacks of insects and other counteracting influences. I have known a plant of *Ficus elastica* which for many years kept its place in a window in the heart of London, and it always looked fresh and healthy.

I have another suggestion which, within certain limits, may be worth attention. In towns, where the light is obstructed by buildings as well as by a perpetual cloud of smoke, it is scarcely possible that plants which in their natural habitat enjoy the full light of the sun can be expected to do well. But happily there are plants that naturally seek the shade of woods. Among these we find the Oxalis, the Wood Anemone, the Lily of the Valley, the Woodruff, the Periwinkle; there are besides that neat and still pretty trailing, but rather neglected plant, the common Moneywort (*Lysimachia nummularia*), and many more plants that are in reality not the less attractive on account of being found in a wild state in this country. I have an idea that such are likely to be more attractive among the poorer townspeople than exotic plants, on account of their association with the scenes of their holiday rambles; at any rate, I have known a common Primrose prized and cherished with as much or even more regard than the well-to-do has for his choice collection of exotics.—T. C.

## Codiaeums (Crotons).

**PROPAGATION.**—The time will soon be at hand to commence propagating these popular and useful plants. Some gardeners prefer to do this in the early spring, but where serviceable young plants are required in April, May, and June it is advisable to propagate in September. Procure well-coloured tops, and insert them singly in thumb-pots filled with a mixture of loam, sand, and plenty of leaf soil; they root very readily in the latter.

Place the pots in a propagating frame, wherein a good bottom heat is maintained. Syringe them lightly every morning, and keep the frame closed during the day; at night remove the light. If bottom heat by means of hot water piping is not available, fill the frame half full with stable manure or leaves, place a layer of sawdust or cocoa-nut fibre on top, and plunge the pots into it.

When the cuttings are rooted, take them out of the frame and stand them in a shady position in the stove for a couple of days before potting them. A shift into large 60 or 54 size pot will be large enough to carry them through the winter. For potting use two parts fibry loam, one of leaf soil, and one of charcoal and broken crocks. In February shift them on into 48 and 32 size pots. Plants of a good size, and suitable for house and table decoration, can be grown in 48's.

**SUMMER TREATMENT.**—The plants should at all times be placed in such a position in the house that they will receive plenty of light and sunshine; the nearer the glass they can be kept the better. Use the syringe among them freely two or three times a day, according to the weather. Besides promoting a free growth this will keep insect pests down. To ensure freedom from the latter it is an excellent plan to syringe the plants once a week with some insecticide; 2oz of softsoap, and the same quantity of paraffin oil to every gallon of water, takes some beating for keeping Crotons clean if used properly. When the pots are full of roots stimulants may be given to them with beneficial effect. Diluted cowshed drainings is the very thing.

Endeavour to obtain as much growth as possible in the plants during the spring and early summer, and then direct attention to the colouring of them. The system I adopt to obtain a good colour is, when sufficient growth is made, to admit plenty of air, especially on calm days; at the same time maintain a good heat in the pipes, and keep the atmosphere of the house somewhat drier than usual. Further, leave a crack of air on all night when the outside temperature is above 58deg. This treatment will bring out all the bright and various colours—which are so much admired in a well grown batch of Crotons—to perfection.—GEO. RIMMER, Waddesdon Gardens, Aylesbury.

### Cattleya Rex.

This South American species (Andes of Peru) is of the labiata section, flowering in summer, and has creamy-white to yellow sepals and petals. The lip is crimson veined with yellow, shaded white and yellow, with a white fringe. It requires a warm house to succeed with it.

### The Week's Cultural Notes.

The Angulcas are now finishing their growth, and it is important that they are encouraged to do this well, strong, healthy pseudo-bulbs being always followed by fine flowers, provided the former are properly developed. Where recently repotted the roots will by now have sufficiently penetrated the new compost to take a full supply of water without injury, and this must be allowed. After the bulbs are fully grown the plants will be better for a week or two in the open air if the garden is sheltered. But they must not be exposed to the full sun at first, the tissue of the plant requiring to be hardened a little by slight exposure in a frame.

The shade of a fruit tree or shrub is sufficient protection if a frame is not at command, and the water supply must at first be quite as liberal as when under glass. Afterwards much less will suffice, until in winter only enough to keep the bulbs plump need be given. There are now many plants coming from the flowering house to be returned to the growing quarters, and these require a little more care than usual, not allowing the sun to shine fully upon them at first, and maintaining a moist atmosphere about them; a kind of convalescent treatment, in fact.

The deciduous *Calanthes* have almost finished growing, and will require plenty of room. The removal of some of the earlier plants of *Dendrobium* from the warm house will probably allow of the *Calanthes* being spread out a little, thus allowing the light to reach all parts of the foliage and the embryo flower spikes, to their benefit. Keep the water supply going fully to the roots until the foliage begins to turn colour, after which it is useless, as at this time the roots commence to decay also. This does not apply to *C. oculata gigantea* and similar late flowering sorts.

While allowing an increased amount of sunlight to most of the intermediate and warm house species, carefully screen those of tender foliage, instances that occur to mind being the *Paphinias* and *Promenæas*. It is just possible that some of the former may require attention to the compost, their fleshy roots simply refusing to enter sour or waterlogged soil. Green sphagnum tips and a sprinkling of loam fibre is very favourite compost for these sensitively rooted species.—H. R. R.

### A Beautiful Orchid in Aberdeen.

At present there is being displayed in the shop window of Messrs. Cardno and Darling, florists, Guild Street, a rare and beautiful Orchid, grown by Mr. Robert Walker, superintendent

of the Victoria and Westburn Parks, in the Victoria Park hot-house. The plant, which is of the genus *Stanhopea* (a large genus of handsome flowered epiphytes, named in honour of Earl Stanhope), and of the species *tigrina*, has two large pendant flowers, and it may be mentioned that there was a third flower, which, however, did not thrive as the others did. The following description of the plant is given in "Cassell's Popular Gardening": "*S. Tigrina*.—This species produces the largest flowers in the whole genus, often measuring 8 in across. Sepals and petals very thick and waxy, the ground colour a rich yellow, irregularly blotched and striped with rich brown. Lip tawny yellow, dotted with reddish-brown. It yields a very strong odour, somewhat between vanilla and melon, and very aromatic. Summer months, Mexico." The specimen on exhibition is an excellent one, very creditable to the skill of Mr. Walker and his staff as floriculturists, even with their limited hothouse accommodation.

### Earthing Celery.

This is an operation that requires considerable care if the gardener desires to secure finely blanched clean sticks, or heads, of good quality; but it is often done in a slovenly and careless manner, which cannot possibly give the best results. The time is now on us for attending to this most important operation. Some growers make a practice of earthing all at one time; but where the extra time and labour in giving more attention to it can be spared, the results are very much more satisfactory. It is far better to accomplish it in three different operations, with

Cattleya Rex.

intervals of ten days or so, before the final earthing up is complete. Some time during August the earliest Celery should be ready for the first earthing, which should only be slight. The greatest care is required to prevent any soil from dropping between the leaves into the centre of the plant. All suckers should be removed and the loose soil gently but firmly pressed round with one hand. Where possible it is much better to mix some sharp sand with the soil lying close against the plant, which acts as a preventive against slugs. On completion the tips of the leaves only should show above the top of the trench, the sides of which should be firmly made into a sharp slope. The old method of binding round the plants with paper, straw, large leaves, and other materials, which at best only harbour slugs and other pests having a taste for this esculent vegetable.

### Origin of Our Garden Fruits.

Like so much that is grown in our everyday gardens, be it fruit, flower, or vegetable, we are indebted for their origin in no small degree to some foreign clime which in their pristine form has given them birth. A few notes on the subject of the native habitat of our chief garden productions in the first-named class may therefore be of interest in the present season, now approaching its zenith and flush with a summer's growths. Alas! that the sum total of "small fruits" of this year of grace should be a singularly dismal tale of woe.

To begin, then, with that earliest and most useful little pioneer, the homely Gooseberry, welcome all the way along from early May to when the summer is dying hard (if netted latterly from the predatory blackbird), both for its excellence alike in the green state as in the condition of its many-coloured ripe maturity. A rather wide sphere seems to represent its proper home, ranging from many parts of Europe to Northern Asia. Probably, however, it is not a native of Britain, having apparently only been in cultivation here some two or three centuries. Its special culture has been chiefly taken up in one of our northern counties, viz., Lancashire, where several varieties have attained to such a height of perfection, or shall we say size, that exhibition specimens have been found to scale up to two ounces, a surprising weight indeed for so small a fruit. One gardener of the writer's acquaintance described with pride how by good culture the Gooseberries under his charge had become so gigantic that his mistress complained that she could not get them into her mouth, whereupon he obtained from a nurseryman a specially small kind which ever after went by the name of Mrs. —'s Gooseberry! The seed of the berry of this little shrub takes root in many an out-of-the-way and unexpected corner. Besides frequently springing up in woods well away from the abodes of men, it will confront one in the poorest and driest soil, right under some shrub or tree, where but a modicum of direct sunlight can reach, yet often, too, making a brave show of small fruits thereon.

As regards its sister product, the clustering Currant, perhaps this fruit derives its name from Corinth, where the small Grape for which it is famous is so largely grown. It is a denizen of the woods in Southern Europe, and may be said to be a naturalised native here, while its black confrère inhabits moist woods and banks of streams in Europe and Northern Asia; which latter haunt, too, the Red Currant seems fond of, as witness several seedling bushes right in the bank, and almost touching the water of my own stream here in Warwickshire, and bearing year after year quite respectably sized fruit, totally uncultivated and uncared for.

Next in order I think the Strawberry demands our attention, and I believe I am not incorrect in stating that many of our best kinds have their origin as regards pedigree from Chilian lineage. It flourishes, however, in very diverse climates, being a lover both of Alpine altitudes, where it seems to assimilate to itself somewhat the flavour of its Pine surroundings, and of lowland woods. Still, in its wild state its particular penchant is on sloping ground at a good height, and on very dry, well-drained soil, but much shaded. Judging by our British wild Strawberry, indeed, the cultivated kind seems to have not much in common with the former, requiring for successful growth a good stiff soil such as clay to root in, and plentiful supplies of liquid.

The Raspberry, besides being common in Britain, is found wild in its various kinds pretty well over the whole of Europe, as well as Northern Asia and other parts, delighting even more, perhaps, than the Gooseberry in its unreclaimed state in dense shaded copses.

And now we come to the Plum, that fruit which many regard with very mixed feelings. In years of plenty I fear the poor grower makes but a scanty thing out of the bounty. Time and again one hears the same dismal tale of the fruit

not paying to gather, and the waste which consequently takes place is deplorable; occasionally, indeed, the fruit being allowed to fall and rot on the ground. In a manufacturing town not a hundred miles from the Midland metropolis I came across the case of an aspiring cottager from a neighbouring village, who, like the costermonger in comic rhyme, "wheeled his wheelbarrow through streets broad and narrow," full of luscious Victorias, in his case some three miles to market, only to find a fine glut on; and, having no use for them at home, in despair cum a little temper, perhaps, he emptied his load out on the roadway, for which he was duly fined, poor fellow, for causing an obstruction! I wot the insult added to the injury sent him home a wiser though a sadder man. Beguiled from my proper theme by this digression, I may say that the Plum seems indigenous over Europe generally and central Asia, most, if not all species being derived from the Sloe (*Prunus domestica*), and being the wild Plum found in hedgerows and thickets over England and in parts of Scotland, while in addition there are the other varieties of wild Plum, such as the Damson, Bullace, Mussel, and Wine-sour.

A word here regarding the Cherry, that fruit which the birds of the air seem to consider as their own particular prerogative; though fortunately the kind termed Morello is not quite so much to their liking. Its birthplace has a very wide realm. In its wild condition, in fact, it is found in several continents and in many countries, the glorious wealth of blossom making it more than conspicuous whether in the hedgerows and woods of our own islands and continental lands, or in the Himalayas and temperate parts of Asia; while those who have seen the gorgeous display of bloom in the semi-cultivated parks of merry Japan, where the Cherry is so especially prized and grown, not indeed for the sake of the fruit, but for its pure white blossom, beloved by its inhabitants, and employed for decorative, social, and religious purposes, will not readily forget the feathery, cloudlike effect produced in such spots as the Ueno park in Tokio, and other special districts.

One other summer fruit must be touched upon—videlicet, the Apricot. A native of Armenia, this grateful delicacy has been cultivated in England since the sixteenth century. Very large numbers are grown and dried for home and export trade at Bokhara, while travellers in the near Orient will readily be familiar with what is partly a staple food, the mishmish of Arabia and other similar countries. That accomplished Eastern scholar Canon Tristram, if I mistake not, holds that the Apple of Scripture was de facto the Apricot, which version, other experts concurring, may probably be accepted as correct.

We come now to our later or autumnal products, and first of all the Peach. As its name somewhat implies, Persia is its godfather, perhaps, though for its real original home I trow we must go much further afield—indeed, to mystic Cathay, for presumably it came in the first instance from China, and, like the Nectarine, whose stone kernels are similar, it belongs to the genus *Rosaceæ*. As is well known, nowadays it is very largely grown in several of the Southern States of North America and in California. Being of rather a shy nature, and requiring a quantum of its natural element, the sun, it can scarcely be looked upon as a successful hardy fruit in the north of our own country, or even in the Midlands, as a rule; but in the South and West of England and Ireland, against a wall with a southern aspect, and a little protection by a top coping and herring nets to guard from frost, it succeeds remarkably well.

Next comes the Pear. This is found in many parts of Europe and temperate regions of Asia. It may still be seen in Britain in its wild state, possessing a very thorny and harsh fruit. It, too, is largely grown in Georgia and other Southern United States.

The invaluable Apple was probably introduced into Britain by those pioneers of empire-making and civilisation, the Romans, who cultivated it extensively, though it is from the Crab tree native of Britain that most of our modern Apples are produced. It would seem that the seeds of this fruit are as capricious as many other progenitors, whether of the animal or vegetable kingdom; for I have in my orchard a twelve-year-old stripling sprung from a Wyken Pippin seed (the Wyken is a local favourite in Warwickshire, and named from the adjoining parish, where apparently it was originally raised). Now, as all lovers of this little favourite know, the Wyken Pippin is a very small and firm bright yellow Apple, nearly round, with a flattish head, whereas the produce from its seedling is an enormous

brilliant red fruit, soft fleshed, and oval in form. This seedling appears to me quite good enough to introduce into commerce. For the nonce, however, its presence and fame are confined to the spot it emerged from, and its name is that of its sponsor in the flesh, the gardener who sowed it, "Atkins' Seedling."—J. A. CARNEGIE-CHEALES.

#### Figs under Glass.

**EARLY FORCED TREES IN POTS.**—Immediately the second crop of fruit is gathered examine the trees for red spider and scale, as keeping the soil and atmosphere somewhat drier encourages the pests. They are almost certain infesters of Fig trees in heated structures, and get ahead during the ripening of the fruit. When that is cleared off the trees, recourse must be had to cleaning. If, therefore, these pests have made undesirable progress, it will be advisable to syringe the trees with a paraffin oil solution, one part softsoap dissolved in eight parts boiling soft water, and to three gallons of this solution add a wineglassful of paraffin oil, and churn with a syringe until well amalgamated; then use at a temperature of 135deg, wetting every part of the tree, the under as well as upper side of the leaves, and all the wood. Paraffin oil emulsion diluted with ten parts hot water may be used for the purpose. To prevent the solution soaking into the soil a little dry moss may be tied round the stem, and then a sort of pyramid of the same placed about the plant and extending over the rim of the pot. In severe infection repeat this in the course of three or four days, afterwards syringing thoroughly with tepid water. The trees will only need water to prevent the foliage becoming limp, ventilating to the fullest extent day and night, but protect the trees from heavy rains.

**EARLY FORCED PLANTED OUT TREES.**—As the second crop is ripening a circulation of air constantly is imperative, more, of course, by day than at night. If dull weather prevail a gentle heat in the hot-water pipes is necessary to secure well-ripened fruit and prevent spot, a fungus disease attacking the Figs at the eye. Watering at the roots should be diminished and syringing discontinued; but a moderate air moisture may be maintained for the benefit of the foliage. If red spider is present heat the hot-water pipes to from 150deg to 200deg, and paint them with flowers of sulphur formed into a cream with skim milk, keeping the house closed for the night, but allowing the pipes to cool after about an hour. As soon as the fruits are all gathered the trees may have a good washing with the syringe or garden engine to clear the foliage of dust and red spider, otherwise a free circulation of warm, rather dry, air should be maintained in the house until the foliage commences falling naturally, which must not be accelerated by allowing the soil to become dust dry at the roots.

**UNHEATED HOUSES.**—The fruit is advanced in swelling, and ripening commencing. Admit air early, increasing it with the sun heat, maintaining through the day a temperature of 80deg to 85deg, with free ventilation, closing early so as to run up to 90deg or 95deg, even 100deg; and when the sun's power is declining a little air may be admitted at the top of the house, so as to allow the pent up moisture to escape, the temperature gradually cooling down. Water or liquid manure will be necessary for keeping the soil properly moist.—GROWER.

#### "White" Blackberry.

A "white" Blackberry is reported from Santa Rosa, California. It has been grown by a well-known breeder of new fruits, Mr. Luther Burbank, and is a cross from the Lawton Blackberry. It is called the Iceberg, and is quite hardy as well as prolific.

## The "Daffodil King" on Tour.—No. 8.

(Continued from page 78.)

#### MELBOURNE.

Melbourne has one of the finest botanical gardens in the world, and Mr. W. R. Guilfoyle, the superintendent, is an artist who has brought his abilities to bear in the laying out and planting of the grounds. These contain a large, ugly reservoir, which rises up to a peak like that of a small crater. He has treated this as it stands, by covering the surface with weather-worn stones to represent the flow of lava, and planted amongst these stones metallic-grey Agaves and similar plants. Melbourne has made a new entrance to their Botanic Gardens, and, in doing so, a large slice had to be taken from the elevated ground on which the Government house is built, and from the railway this looked from its smooth surface as if an immense slice had been cut from a gigantic cheese; the bad effect is being shrouded off by the planting of suitable shrubs and the building of an elegant temple. There is a good botanical collection of plants maintained, and

Mr. Barr says he knows of no finer public resort in any part of the world he has travelled in. The grass is in large expanses, and always kept in perfect trim. The garden is lacking in glass structures, but there is one conservatory with a goodly assortment of well-attended plants.

Mr. Guilfoyle suffers from the way in which his labour supply is provided. Instead of being allowed to have a staff of his own choosing, he has men supplied to him often from the public office—men who are simply messengers, and worthless as garden labourers, and frequently after he has had the trouble of training this raw material, back they go to indoor service. This, of course, handicaps him very much.

There are some parks in Melbourne all of considerable interest, while street planting is becoming a very important feature. Melbourne is far and away the finest laid out city in the southern hemisphere, and the citizens are determined, so far as that is practicable, to make it the most attractive city. Great progress in this respect was made even during Mr. Barr's stay in Australia.

The old horticultural gardens of Burnley are close to Melbourne, and are at the present time in the hands of a very efficient superintendent, a man likely to make his mark in Victorian fruit culture. This is Mr. Luffmann; Mr. Barr attended a number of his lectures to the students, and speaks in the highest praise of his ability to command the keenest attention of his audience.

The soil of Victoria is admirably adapted for agriculture, but the original gifts of locations have now, Mr. Barr thought, largely fallen into the hands of a few large holders. The irrigation scheme for capturing the water of the Goulburn river is a magnificent piece of work, and done quite irrespective of cost. Unfortunately, all the farmers will not use the water, with the result that the promoters cannot meet the interest on the outlay.

The Government of Australia have not yet settled on a Capital. Mr. Luffmann, their superintendent of horticulture, had made some useful suggestions, and was one of those who were chosen to select a suitable site.

Adelaide is unquestionably the most beautiful town in Australia. It is not very large, but it is so splendidly laid out, and the situation was well chosen in the midst of hills. It is seldom that the nights are warm in Adelaide, as there are cool breezes from the sea. The town has its botanic garden, containing some fine specimen trees, glass houses, and ruled by a clever director. A few miles out a large tract of land has been laid out as a fruit farm, and this also comes under the botanic garden director's care. If the people of Adelaide do not possess the bustle of those of Sydney and Melbourne, they are yet very hospitable, and Mr. Barr declared that there is more genuine horticulture in and around this city than in any other in the Island Continent.

Freemantle, in Western Australia, is a very primitive place, but Perth, where the Government House is, furnishes a really beautiful city, being admirably situated, and having a fine natural park, carriage drives are laid throughout. Here the "Kangaroo Paw" may be seen in its native excellence, and some of its varieties are of extraordinary beauty. This natural park forms a plateau—overlooking a wide expanse of water, "without exception it is the prettiest bit of landscape I almost ever saw"; and here the interviewer smiled, as the reader now smiles, and as Mr. Barr will smile, when he notices "a contradiction in terms" which his Scottish bump of caution has led him into. The slopes of the park are terraced and are nicely planted.

Here, at Perth, on the Swan river, the black swan can be seen in its native habitat, and large flocks sail up and down, it being a protected bird. The Swan river is a noble sheet of water, but is at present only deep enough for small vessels to navigate, and on one of these Mr. Barr sailed from Freemantle to Perth. Some large P. and O. steamers go as far up as Freemantle, but many of the Australian steamers take in or land passengers at Albany, on King George's Sound, in the south-west of the colony. The governor's garden is of considerable size, but not greatly attractive. Taken all in all, Mr. Barr classes Perth third among Australian cities of note for beauty.

Albany was a prosperous place till Freemantle became a port. It possesses a fine bay, in which ships of the largest size can safely anchor. Close to Albany there can be seen the *Boronia megastigma* in its wild state growing in marshy ground.

#### AUSTRALIAN NURSERIES.

Starting with Brisbane, Mr. Barr observed that this city is practically without a garden nursery. Sydney and Freemantle had had nurseries, but are almost extinct. Melbourne, however, is fairly well supplied, and Mr. Cheisman's is decidedly the finest. Adelaide possesses a nursery which is managed by an old English gardener who seemed to appreciate specimen plants rather than money, and our traveller considered this man's nursery unique amongst those of Australia. If Perth should ever take to growing Hyacinths and Tulips it should become the Holland of the Southern Hemisphere, the conditions being the most favourable of any place found during the Daffodil King's travels.

### Diseased Tomatoes.

Many thanks for your very kind reply to my query re Tomatoes, which I esteem a very great favour, and I beg you to accept my best thanks. I may say we have not been able to stamp out the disease yet, but I have little doubt it was introduced by buying a packet of seed from a nurseryman, as it appeared in four distinct places from two different sowings of their seeds before it appeared on any other sorts, which I think you will agree accords with your very full account.—A. W. R.

### The Celtic Element in Plant Nomenclature.

Some plant names, though in appearance Latin, are, in fact, Celtic. Linum, for instance, is derived from "lin," a thread, and Galium from "gal," white, and not from the Greek gala, meaning milk, as one would expect. "Gal" is in allusion to the prevailing colour of the flowers in the genus. Borage comes from "borr," or "borrach," meaning pride, probably because of its somewhat beautiful flowers. Beta, Beet, has its origin in the word "beadh," or "beathe," food or life, both of which in Celtic imply the same thing. Sium, a well known wild plant, takes its name from "siw," water, as also does Apium (Celery), from "apon," water. Sison, a wild plant of the same order, comes from "sizum," a brook. Allium, the generic name for the Onion tribe, is derived from "all," acrid. Alisma, the beautiful water plant, comes from "alis," water; and Pyrus, from "peren," a Pear.

Rosa does not look as if it were in the least of Celtic origin, yet it is said to be derived from "rhos" (?). Rubus comes from the Celtic verb "reub," to tear, and is very appropriate, at all events. Papaver comes from "papa," the paps, no doubt in allusion to the milky fluid which the capsule exudes. Betonica, the Betony, from "ben," good, and "ton," head, no doubt alluding to its lauded medical virtues.

Brassica, the Cabbage patronymic, comes from "Bresic," a Cabbage; Genista from "gen," a bush; and Ervum, the Tare, from "erw," a ploughed field. Alnus, the Alder, comes from two words, "al," near, and "lan," a river bank.

Betula, the Birch, appears to have the same derivation as Beta, namely, "beadh," or "beathe," and the latter is still the Gaelic name.

Pinus, the Pine, takes its name from "pen," or "ben," a mountain. Salix, the Willow, comes from "scilach," probably derived from "siw" on account of its water loving disposition.

The reason for this blending of Celtism with Latin appears to lie in the fact that Britain, at the Roman Conquest, was inhabited with a race or races whose language was some form of Celtic, probably Cymric. When a race is subdued it seldom happens that their place, or other outstanding names, suffer the fate of their country. These almost always are retained by the conquerors, but more or less modified in form, so as to become adapted to the idiom of the new language. I think this is exemplified in our own history as conquerors all over the world. We find the retention of the old names convenient, and evidently the practical Roman was also alive to this same thing twenty centuries ago.

This form of gilding one language by another is totally different from the complaint set forth in the *Journal of Horticulture* (page 77) by Mr. Fletcher. His objection would seem to be more against the introduction of Latinised personal names as descriptive terms. It certainly is not easy to see how a form of nomenclature could be maintained, with any pretension to accuracy, without adopting something after the manner in question. The first and chief aim of botanists is to make the descriptive name as nearly perfect as possible, and that in the language of the generic name. I think their efforts in this direction are worthy of the greatest praise, for, in consideration of the multiplicity of new names arising from cross-breeding and hybrids, their task is by no means an easy one.

The principle upon which they carry out this task is both simple and intelligent, and at once conveys to the gardener a description or history of the plant so named. It does not follow that the suffix "um," or even "us," is the only one used in such cases. As is well known to gardeners, this depends upon the gender of the plant, and on any other characteristic which it is desirable should be qualified. Our plant nomenclature, though far from perfection, is, I think, one of the finest examples of skill and learning that any science offers.—D. C.

### Co-operation in Horticultural Competitions.

The success of the movement which owes its inception to the enterprise and resourcefulness of Lady Algernon Gordon Lennox has shown clearly what can be done by combination among cottagers and amateurs. In the large tent in which the exhibits were staged at Broughton Castle on August 3 there were unmistakeable evidences of great cultural skill and painstaking effort in staging. Not only was the show a success from a cultural point of view, but judging from the vast crowds who flocked to see it, it is evident that what is generally designated as a "flower show" (even when consisting principally of vegetables) will still attract the multitude, provided those interested are distributed over a wide area, and also that such quaint and delightful places as Broughton Castle and its surroundings can be secured for holding the exhibition. Quiet Banbury became a perfect Mecca for one day only, and the roads between it and the "moated castle" resounded with the unceasing rumble of rolling wheels and the merry voices of city toilers and stalwart countrymen on pleasure bent.

Similar competitions will undoubtedly be arranged in other counties in the future; a new era in horticultural shows may, therefore, be said to have begun. We live in an age of combines, and it seems to me that this principle of co-operation may with advantage be developed in regard to shows at which professional gardeners compete. Why should we not have a great show every year at which the collective produce of each county in Britain could be staged in competition? The details of such a competition would require careful consideration, but the following suggestions may perhaps provide a crude idea from which a workable scheme could be evolved.

Each county intending to compete should form a union for that purpose. Trade growers should not be allowed to compete. The show should be held in a different county each year. Each competing county should guarantee an equal portion of the working expenses. The competition should be for a collection of cut flowers, fruits, and vegetables. The prizes ought necessarily to be large and numerous, as a good system of organisation would be imperative in order to secure the best produce in each county. In addition to money prizes a handsome challenge trophy should be provided, which would show in a tangible way the horticultural superiority of the county holding it.

The thought which at this stage will naturally rise to the mind of readers is, Could such a competition be made a financial success? I for one think it could, because the horticulturists of every county would become keenly interested in the success of their own union, and the competitive spirit thus engendered should lead to progress by imbuing all true cultivators with the desire to grow something well enough to form a part of the "county collection." I trust the above remarks will have the effect of eliciting the opinions of various readers of the *Journal of Horticulture*, and of securing the co-operation of prominent horticulturists in many parts of the country.—WANDERER.

### The Carrot Crop.

Being but a "mere gardener," and not one of those appointed to instruct an enlightened peasantry in the art of growing Potatoes and Cabbages, it is with some slight trepidation that I venture to pen a few remarks in reference to the dismal tales of the failure of Carrot crops so recently published from *Journal* correspondents.

I am firmly convinced that culture has a great deal to do with the troubles recorded. One has only to notice the difference in the crop raised from a given piece of land by different men to feel sure of the truth of this; for where one fails ignominiously the other will as signally succeed. Give one of our first-rate exhibitors of vegetables the poorest of land in the worst possible condition on which to produce these roots, and though he may not be successful the first season, he will by his methods in the succeeding year, in nine cases out of ten, draw Carrots fit for the show table.

As is well known, deep soil culture is a great factor in the ultimate gain or loss in respect to this crop. Different times for sowing the seed have, as I well can prove, an important bearing on the subject. In some localities early seeding is advisable; in others a later period must be chosen. Above all, the plants should be kept growing without a check from the commencement to the end of their career. Drought, which is such a certain precursor of insect attacks, must, as far as possible, be avoided, and here we have an unanswerable argument in favour of deep cultivation for this vegetable.

The prevention of injury from aphids is comparatively an easy matter; light dressings of soot applied over the plants in showery weather will not only be a great aid against these attacks, but also in great measure ward off the winged insects which are the first cause of the maggot trouble. It is, however, hardly necessary to enlarge on the various remedies and measures of precaution that growers have found useful, for they

have all, or most of them, been enumerated in these pages at various times. The chief essential, after all, is a deep and generous soil, thoroughly worked and sufficiently charged with nutrient matter without being crammed to sourness with humus. —TREWEN.

I notice that the Carrot disease is, as is its wont, the cause of some anxiety among a few of your correspondents. Few gardens do really turn out a crop of presentable Carrots. This is a pity, because a more useful root for the kitchen is not in the category of our culinary vegetables. The ravages of the dread Psila have made many gardeners abandon Carrot growing altogether, with the exception of a few early forced ones. Since my first contact with horticulture, the Carrot problem shared a part of my attention, and as far back as twenty years ago I put some of my "dreams" into practical effect, with the result that I gave expression to my success in a well-known gardening paper, then edited by Shirley Hibberd. This being my first venture, no one

dung and leaf mould was laid down, and the clay from the bottom placed above it on the surface. This process was carried on till the whole plot was literally turned upside down. Of course, the soil was about 2½ ft above the level of the walks. Every person was good enough to tell me that I "did" for that plot. My employer thought differently, and encouragingly assured me that if Carrots can be grown something such as I was essaying must be done. The Carrots *did* grow, and continue to do so.

I confess that the appearance of that plot as it lay bleaching in the autumn and winter rains was not inviting nor at all promising. The frost powdered down the clay, but that did not do much to take away its adhesive character, and it was evident before seeds of any kind could catch on, that something more must be done. I set the cart to drive a few loads of old (mellowed with age) leaf soil, which was forked and reworked into the clay previous to seed sowing, so that the surface was in a very fair condition indeed for the first crop. Still, I was not very sanguine of success. However, my Carrots and Onions,

*Cornus brachypoda variegata.* (See page 150.)

will be astonished to learn that the cure was not of a permanent nature. The mode of operation was simply carting away a part of the garden soil and refilling the excavation with a compost of peat, sand, rotted dung, and leaf mould. The first and second years gave capital crops, but afterwards the Carrot fly found its way into the area, and matters were as bad as ever. After the considerable expense incurred by the formation of this experiment, I naturally had recourse to every declared remedy, with the effect that ever since then I lost every particle of faith in topical treatment for the prevention or cure of the attack. The salt treatment of any was the best, but I laid the task before myself to grow Carrots without any artificial means beyond the thorough tillage of the soil of the garden, whatever that might be. I found long since my "dream" realised, and in this simple matter lies the secret of successful Carrot growing.

The garden here was one of those designated as unsuitable for Carrot culture. I got to work as soon as possible, by trenching a break about 3 ft deep, just the depth of drainage. To my horror, at the first spit I found only 1½ in of black soil, all the rest under this was blue clay. Well, thought I, if I am to do anything at all, it is clear these soils must change places. This settled, I set two men to wheel into the trench vegetable refuse, and then filled it up with well rotted dung, while two other men dug the soil over.

The first spit being turned, another liberal supply of rotted

Parsnips and Beets were everything that could be desired, and have continued to be so ever since. I grow them on the same plot, and only give dressings of leaf soil and pure horse droppings each year.

This year I have been walking through my Carrot rows, and the foliage reached half way above my knees, a height of not less than 2½ ft. I do not grow any but the three following good old sorts: James' Scarlet, Long Red Surrey, Altrincham Improved. The soil for Carrots does not appear to me to be of so much moment as its porosity, without being of a nature that its moisture is readily absorbed by evaporation. The disease is also, in my opinion, an effect of indifferent tillage rather than an actual disease. Perhaps this theory has wider ramifications than we are at present ready to admit. Leastwise, we know much can be done by good treatment to ward off many of the ills of plant life. Therefore it is not by any means incongruous to suppose that by adhering to the principles likely to be conducive to health, many disastrous diseases may become quite unknown, and in time perhaps become eradicated altogether.—D. C.

[Mr. Geo. Chaplin, gardener at St. Leonards, Edinburgh, succeeds in growing splendid exhibition Carrots. He trenches his stiff soil, makes holes at 6 in or 8 in apart, in lines; fills these with light compost; sows three or four seeds carefully in each; thins the few seedlings early; then mulches between the rows with mown lawn grass. The fly is baffled.—Ed.]

### Stocks for Roses.

In last week's Journal three communications appear in the Rose column which seem to call for some comment from an old contributor. "D. A." in his otherwise very interesting note, seems apparently to have confounded petals with leaves throughout, and one feels sorry that "S. F.," with his love for the queen of flowers, should not have better varieties on which to feast his eyes; but "Surrey Hills" takes one back in imagination twenty years ago, at least. At that time, if correspondence flagged in the Journal, whether winter or summer, it only required a casual recommendation of either the Briar or the Manetti as a stock, to start at once a lively argument with two or three vigorous correspondents on either side. But it died out at last. I did not think it was possible to renew it. I do not know that the Manetti men actually owned themselves vanquished, but the consensus of opinion in favour of the Briar became at last so general among nurserymen and amateurs, and for all soils, that I fancied it was altogether agreed upon.

It must be a good many years ago now that I remember Mr. Geo. Paul complaining that he could not sell plants on the Manetti. It used to be said that the Manetti, which roots a little deeper than the Briar cutting, though not nearly so deep as the Briar seedling, was more suited to light soils; but this proved not to be the case in practice, except with very strong growing varieties, as the numerous coarse strong roots of the Manetti could not thrive without strong growth to balance them, and the result was sooner or later a failure. About that time it was also supposed that clay, or at least really heavy land, was necessary for Roses on the Briar stock; and when this, too, was proved to be a fallacy, when it was shown that good rich land (though a tendency to greasiness is desirable) is all that the Briar requires, even for the best H.P.'s, the triumph of the Briar became complete. The Manetti is still used for indoor propagation, and for such strong growers as Crimson Rambler and the Penzance Briars. I think it should not be used even for these, for I saw a good many Manetti suckers lately, unrecognised by the gardener, in a hedge of Penzance Briars; but it is such an easy stock to work that there is much temptation to use it.

But "Surrey Hills" also revivifies an even older controversy. About once every year someone used to write, proclaiming as a new discovery that Roses would grow on their own roots; that he had struck Roses as cuttings, and had some beautiful flowers. How beautiful these flowers were compared with those on the Briar stock of course the readers of the Journal had no means of judging; but, once again, the opinion of all rosarians, except one or two prejudiced against all plants worked on alien stocks, was unanimous against own root Roses, and in favour of those on the Briar stock. Our Manetti friends now came to the rescue. Plant the Manetti worked Rose deep enough, and it will throw out roots of its own. You will thus have both, and a plant of extra strength.

If the poor Rose plant were asked, what would it say? "I was obliged, in utter despair, as a Vine throws out air roots, to send out roots nearer the surface, or I must have perished entirely; for the stock roots, on which I was budded, were simply buried, not planted, far away from the life-giving influences of sun and air, and the food supplying surface bacteria. 'Surrey Hills' budded me 4in deep, and, of course, the roots were deeper still." A Rose plant thus planted too deeply will always try and remedy the mistake if it can by throwing out feeble fibres nearer the surface; but such roots as these can hardly do more than just keep the plant alive. Only in the extra vigorous varieties, such as those already mentioned, can good healthy plants be formed by such means, with much waste of time.

It appears, too, that "Surrey Hills" forces his buds into growth the same year as the budding, I suppose by cutting away the Manetti growth above. This would act as a further check to the plant, which could never have been good with the stock planted so deeply that it can be budded 4in below the surface. Let "Surrey Hills," even on his light soil—my own is similar—not be afraid of the Briar stock or of shallow planting and rooting. Let him enrich his soil to the utmost with manure and humus if he cannot get good heavy loam, and cultivate the surface assiduously with hoe and liquid manure, and I think, if he tries it fairly, he will say that neither own roots nor Manetti will give such good Roses as the shallow roots of the Briar.—W. R. RAILLEN.

P.S.—On reading the letter of "Surrey Hills" a second time, it seems most probable, as he speaks of a disastrous year, has lost plants on the Briar, and found roots on the stems of his old

plants, that he has planted them all too deeply—a common mistake, which has brought misery and death to thousands of valuable and otherwise well cared for plants.—W. R. R.

### Evergreen Shrubs for Seaside Planting.

**COMMON HOLLY (ILEX AQUIFOLIUM).**—The common Holly ought, perhaps, to have been placed with the trees, as it attains to a considerable height in sheltered positions and favourable soils. It does well by the sea, but not in the full brunt of the ocean storms, though it never flinches, but stands out boldly to the sea breeze. Its golden variety is equally at home by the sea, and also many others, including the very handsome Balearic or Minorca (I. a. balearica) and Hodgins' (I. a. Hodginsi).

**ESCALLONIA MACRANTHA.**—This very handsome shrub succeeds admirably on the sea coast, and forms a good hedge or shelter plant. Its crimson-red flowers are freely produced. It does particularly well trained against a wall, and thrives in northern parts as well as southern of England.

**OVAL-LEAVED PRIVET (LIGUSTRUM OVALIFOLIUM).**—This does well either as a shrubbery or as a hedge plant on the sea coast, and succeeds in all but wet soils.

**BOX (BUXUS SEMPERVIRENS).**—The common Box and its varieties thrive fairly well by the sea, especially on free and calcareous soils, but does not care for the full force of the ocean storms, hence should have shelter, and for covert is unique, as it is one of the few subjects that ground game do not eat. In this connection may also be named the Spurge Laurel (Daphne laureola).

**GRISELINIA LITTORALIS.**—This New Zealand shrub succeeds on the coast, withstanding the sea wind well.

**AUCUBA JAPONICA** and its varieties, also **EUONYMUS JAPONICUS** and vars., succeed on the sea coast with moderate shelter, or when not in very exposed situations. Similar remark applies to **BERBERIS AQUIFOLIUM** and **B. DARWINI**, both of which produce an abundance of purple berries much relished by birds and game.

**THE SWEET BAY (LAURUS NOBILIS)** and **PORTUGAL LAUREL (CERASUS LUSITANICA)** are valuable for seaside planting, affording a considerable amount of shelter, but they are not suitable for exposed positions, hence are best employed where the direct force of the sea blast is broken up. Where this is the case the **LAURUSTINUS (VIBURNUM TINUS)** and vars. succeed, and are very ornamental. Similar observation attends the **STRAWBERRY TREE (ARBUTUS UNEDO)** and its varieties.

**TEA TREE (LYCIUM BARBARUM).**—Under the term of Tea Tree come the species **L. afrum** and **L. chinense**, the latter very closely allied to the European Box Thorn (**L. europæum**), which forms capital hedges with a few stakes driven in here and there in the line of fence. Hedges of this species are made on sea banks, and grow so densely that it is not possible to see through them. It will grow in apparently pure sand, and even where washed by the waves. The first named species is, perhaps, the best for training against trelliswork, covering arbours, and clothing walls, but all are suitable for such purposes, and thrive well in any well-drained and porous soil.

**GARLAND FLOWER (CLEMATIS MONTANA).**—This has few equals for covering summer houses and training to walls or trelliswork. **HONEY-SUCKLES (LONICERA PERICLYMENUM)** and vars., also **L. SEMPERVIRENS**, do well.

**EVERGREEN THORN (CRATEGUS PYRACANTHA)** and vars. is quite charming by its berries in autumn and winter. It is well suited for clothing a large area of wall, as also is the **SMALL-LEAVED COTONEASTER (C. MICROPHYLLA)**, its coral red berries being very beautiful. **SIMONS' COTONEASTER (C. SIMONSI)** is well adapted for training on walls and other naked erections, it berrying very profusely and handsomely.

**COMMON JASMINE (JASMINUM OFFICINALIS)** grows famously, and produces its white fragrant flowers from June to September, and later on. Indeed, it often keeps on blooming until the Naked-flowered Jasmine (**J. nudiflorum**) comes into flower, and blooms through the winter. Both grow very rapidly, and are good for either trelliswork or walls.

**IRISH IVY (HEDERA HELIX CANARIENSIS).**—For clothing tree stumps or unsightly wood or stonework, and for north or other walls, as well as for forming a green carpet under trees or on banks, this evergreen rivals all others in doing its work quickly and effectively.

Roses of varied types do fairly well, the general favourite for climbing being **Gloire de Dijon**.—G. ABBEY.

### The Crosfield Conservatory, Warrington, Lancashire.

The Crosfield Conservatory, presented by Mrs. John Crosfield, is for the future to be the home of the grand pyramid Camellias, which have on many occasions been noticed in your columns, and which were certainly the glory of Lancashire and the pride of Walton Lea, Mr. Crosfield's residence. The Mayor of Warrington, in accepting the gift on behalf of the town, alluded to the kindness of the Crosfield family, and said the gift would be highly appreciated.—R. P. R.

# NOTES & NOTICES

## York Gala, 1904.

The new secretary of the Grand Yorkshire Gala (Mr. Fred Arey) informs us that next year's Gala has been fixed for June 15, 16, and 17.

## United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the Caledonian Hotel, Adelphi Terrace, Strand, W.C., on Monday evening last. Mr. Thomas Winter presided. Seven new members were elected, and one other nominated. Four members are receiving sick pay, and eight are on the benevolent fund at the present time. Three other members have been relieved from this fund this year.

## Sussex Weather.

The total rainfall at Abbot's Leigh, Hayward's Heath, for the past month was 4.31in, being 1.60in above the average. The heaviest fall was 1.61in on the 23rd; rain fell on fifteen days. The maximum temperature was 83deg on the 2nd; the minimum 41deg on the 8th. Mean maximum, 72.28deg; mean minimum, 51.01deg; mean temperature, 61.64deg, which is 1.20deg below the average. From June 20 to July 15 we in Sussex enjoyed a period of brilliant weather, which did much good in putting a little warmth in the ground, and benefiting fruit crops, especially Strawberries, which were suffering from want of sun and too much rain. Since the latter date the wet has been disastrous. Only on two days of the sixteen rain did not fall. Much small fruit split and rotted, it being impossible to get them dry for preserving. Potato disease in second early sorts is very prevalent.—R. I.

## July Weather at Belvoir Castle.

The prevailing direction of the wind was S.W., total eight days. The total rainfall was 1.82in. This fell on twelve days, and is 1.00in below the average for the month; the greatest daily fall was 0.78 on the 23rd. Barometer (corrected and reduced): highest reading 30.320in on the 9th at 9 p.m.; lowest reading 29.578in, on the 16th at 9 p.m. Thermometer: highest in the shade, 85deg, on the 10th; lowest, 40deg, on the 8th; mean of daily maxima, 68.41deg; mean of daily minima, 51deg; mean temperature of the month, 59.70deg; lowest on the grass, 34deg, on the 8th; highest in the sun, 134deg, on the 2nd; mean temperature of the earth at 3ft, 57.83deg. Total sunshine, 174hrs 55min, which is 17hrs 47min below the average; there was one sunless day. The above mean temperatures are all much below the averages for the month.—W. H. DIVERS.

## Munificent Gift to the R.H.S.

Sir Trevor Lawrence, President of the Royal Horticultural Society, announces that Sir Thomas Hanbury, whose place at La Mortola has a world-wide fame, has purchased for presentation to the Society the estate and garden of the late Mr. G. F. Wilson, F.R.S., at Wisley, near Woking. The place has long been celebrated, and the skill and success with which hardy plants have been cultivated there for many years show how suitable it is for the purposes for which it has been selected by Sir Thomas Hanbury. The total area of the estate is sixty acres, part of which is used for agricultural purposes. There are a small residence, a farmhouse, and other suitable buildings on it. The variety of soil and aspect, and the unfailing water supply, are essential for the purposes of the Royal Horticultural Society, which will have little to do but to provide the necessary plant houses. Sir Trevor adds: "The Fellows of the Society owe a heavy debt to Sir Thomas Hanbury for his thoughtful and generous gift. All lovers of gardens will gladly know that Mr. Wilson's garden has been rescued from the fate which so often overtakes such pleasaunces when their creators pass away. Now that the Royal Horticultural Society has received this gift, there is every reason to hope that its centennial year, 1904, will see it provided with a new garden, as well as, thanks to Baron Henry Schröder, with a new metropolitan hall and offices."

## Gardening Appointments.

The following notice of appointment came to us three weeks ago, but has been unfortunately omitted from our pages till now: Mr. James Moir, late of Earnock, N.B., has been appointed head gardener and manager to J. A. Shepherd, Esq., Delvine House, Dunkeld, Perthshire.

## Fruit Growers and Railway Rates.

The Earl of Onslow, President of the Board of Agriculture, addressing a meeting in the Town Hall, Maidstone, in connection with the National Fruit Growers' Federation, said fruit growers, by joining together, could send by the railways larger quantities of produce at lower rates than for smaller quantities.

## Liverpool Amateur Gardeners.

One of the finest August exhibitions of this society was held on Thursday evening, in the Common Hall, Hackins Hey. The Cactus Dahlias were a great feature, Mr. E. Paddock's first prize lot calling for more than ordinary mention; Mr. Wallace coming second. The Carnation class for Messrs. Cassell and Co.'s special prize caused a keen competition, and Mrs. Stevenson led. Double and single Begonias were in abundance. There were only two table decorations, both pleasing. Mrs. McGregor was first with a light arrangement of pink and white Carnations and Gypsophila; Miss McCauslane second with scarlet Pelargoniums, Asparagus plumosus, and A. Sprengeri. Mrs. Thomas clearly led the way for cut flowers; while Mr. Hitchmough was second with fine Roses and Clematises. The time occupied by the judges was profitably spent by members in answering questions.—R. P. R.

## Royal Horticultural Society's Notices.

The next fruit and flower show of the Royal Horticultural Society will be held on Tuesday, August 18, in the Drill Hall, Buckingham Gate, Westminster, 1—5 p.m. A lecture on "Hollyhocks" will be given by Mr. Webb at 3 o'clock. \* \* At a general meeting of the Society held on Tuesday, August 4, twenty-five new Fellows were elected, among them being Sir Josslyn Gore Booth, Bart., Col. the Hon. G. Napier, Major-General H. H. Lee, and Major Bernard J. Petre, making a total of 1,070 elected since the beginning of the present year. \* \* The Society will hold a special exhibition of Dahlias on September 1 and 2, in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, Westminster. At this meeting only Dahlias can be shown, with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 6 p.m. on the second day, but other plants may be removed as usual. For schedule of prizes see Royal Horticultural Society's "Book of Arrangements" for 1903, pp. 89 to 93, or separate schedules can be obtained on application to Mr. P. W. Tullock, Sterndale, New Church Road, Hove, Sussex, secretary to the National Dahlia Society. A lecture on "Judging Cactus Dahlias" will be given on September 1 by Mr. C. G. Wyatt, at 3 o'clock.

## Chiswick Conference and Gardeners' Dinner in London.

Visitors coming to the Chiswick Show from off the South-Eastern, Chatham, and Dover, or Brighton Railways, should travel from the respective termini to Chiswick by the Metropolitan District Railway to Hammersmith, thence per electric tram to Turnham Green Church, or by Ealing trains to Acton Green Station. \* \* Those coming from Liverpool Street, King's Cross, St. Pancras, Euston, Great Central, and Paddington terminuses should travel by the Metropolitan Railway from the nearest stations to Hammersmith, and thence per electric tram. \* \* Those coming from Central London should travel by the Tube Railway to Shepherd's Bush, thence also per electric tram. \* \* Turnham Green Church is close to the gardens. \* \* Visitors coming per South-Western Railway main line should change at Clapham Junction, thence per loop line train to Kew Bridge, and thence per electric tram. \* \* Those coming from off the Windsor, Reading, and Thames Valley lines should change at Richmond, thence per frequent trains to Gunnersbury Station. All bringing heavy parcels can obtain cabs at Kew Bridge, Gunnersbury, and Turnham Green Stations. \* \* Visitors to the show purposing to attend the Gardeners' Dinner at the Holborn Restaurant should take tram from Turnham Green Church to Shepherd's Bush, thence per Tube Railway to the British Museum Station.

#### **Sarracenia Stevensi.**

Though the *Sarracenia*s are so beautiful and interesting, they are not much cultivated. Their requirements are simple, an intermediate temperature and a plentiful supply of moisture at the root being what they like. The compost should be fibrous peat, chopped sphagnum, some sherds, and charcoal pieces. *S. Stevensi*, which we figure on another page, is hybrid from *S. flava* and *S. purpurea*. It is purple, with crimson veins, the lid being crimson and crisped. The chief trade grower of *Sarracenia*s is Mr. A. J. A. Bruce, of Chorlton-cum-Hardy, near Manchester.

#### **Roman Hyacinths.**

A batch of medium sized, firm bulbs ought to be secured from a reliable nurseryman and forthwith potted, 5in pots being the best size, these usually holding four bulbs. Extra large bulbs will not be easily accommodated, and should have larger pots. See that the pots are clean, dry, and moderately well crocked. Make up a compost of loam, leaf soil, sand, and a little decomposed manure mixed in. Fill the pots loosely with soil, and work it down so that the bulbs, when arranged, have their tips just below the surface. Do not press in the bulbs too firmly, or make the base hard on which they rest; for if the roots, when forming, meet with too firm material, they will force the bulbs out of the pots. Give a gentle watering after potting, and when the soil has drained place the pots in a sheltered corner outside, or in a frame, and cover with clean, fine ashes a few inches above the pots. Here they may remain for several weeks until roots begin to form freely, which will be known by growth commencing. Then bring out the pots and gradually expose the growth to full light. Give water as required, with cool, airy treatment, until later on in the autumn, when the pots may be transferred to a greenhouse shelf. Early potted bulbs making good growth will bloom freely in November and December without much forcing. The object should be to secure plenty of roots, good growth then following and flowers produced in plenty. Successional batches of bulbs should be potted to prolong the season.—E. D. S.

#### **Trees Carnations**

Provided one has an ordinary warm greenhouse, even the veriest amateur need not despair of having a good supply of these popular buttonhole flowers during the winter months. Between now and September good plants, costing about 1s. 6d. or 2s. 6d. each, should be obtained and housed, heat being given from October onwards. Naturally, as the popularity of a flower increases, so does the number of varieties. Among the sorts seen in florists' windows the most popular, perhaps, is the pink Mrs. Leopold de Rothschild or Mdle. Thérèse Franco. It is vigorous in growth and free flowering, but inclined to splitting, which spoils the beauty of an otherwise perfect flower. A better flower, I consider, and a more pleasing shade of pink, is Miss Jolliffe Improved; but in the opinion of most I suppose the popular "Franco" holds sway. Wm. Robinson, for a dazzling scarlet, is unequalled, and its strong, sturdy appearance when well grown is a good addition to a greenhouse.

Mrs. Thos. Lawson is a sweetly scented, rosy cerise pink. It is hardly a colour likely to please in the daytime, but under an artificial light it assumes an unexpected richness. Uriah Pike, though not classed by some growers as a winter flowering *Carnation*, is admired as much for its strong Clove scent as for its rich crimson colour. Earl Roberts, a pure yellow, is the best of this colour, producing well formed blooms. For a white one is at a loss for a really fine variety, but *Deutsche Braut*, *La Nieve*, or Miss Mary Godfrey may be mentioned. Judging by appearances it seems to be that yellow or white is not a popular colour in a winter *Carnation*.

Other good varieties are Countess of Warwick, crimson; Winter Cheer, crimson scarlet; John Peed, very deep pink; Mrs. Richard Ley, salmon pink; Pride of Exmouth, salmon pink; Western King, rich apricot.—J. W.

#### **Cereus grandiflorus.**

From Messrs. Cannell and Sons we have received a very large flower of this night-flowering *Cereus*. This Swanley firm have perhaps the best trade collection of Cacti in the United Kingdom.

#### **Cornus brachypoda variegata.**

Though now a dozen years or more known to us, we find only a few samples of this decorative shrub about in gardens or parks. It was certificated when Messrs. J. Veitch and Sons, Ltd., sent it before the Royal Horticultural Society's Floral Committee in 1894. The leaves are nearly 4in long, the centre of each being pale green, blotched with a deeper shade, and the deep margin is creamy white. As a soft, dwarf shrub it is effective.

#### **The Fruit Crops.**

Exceptionally large consignments are arriving from Germany, where the weather this year has been much more conducive to fruit culture than in England. Plums and Green Gages, which usually sell at from £8 to £16 a ton, are fetching from £32 to £64. Dealers are fearful lest foreign fruit, which is generally excellent in quality, should eventually oust home grown products. The first consignment of Californian Pears, comprising 10,000 cases, has arrived at Covent Garden, and is realising about 10s. per case of seventy Pears.

#### **Vitality of Seeds.**

Last year a systematic effort was begun in the Department of Agriculture to determine how long seed vitality was retained under different conditions of storage and climate. To this end boxes containing five packages each were sent to different parts of the country, and to the West Indies, and arrangements made to have them stored. All possible variations of climate were selected for tests, and the experiments are being conducted with as much uniformity as possible. It is now nearly a year since the seeds were sent out, and instructions are issued directing that the first of the five packages be returned to Washington with a statement of the conditions under which it was stored, the temperature variations it was subjected to, and the relative humidity of the place. Next year the second package of seeds will be called in, and so on for the five years. The seeds, after being returned, are to be carefully tested to ascertain how well they withstood the conditions imposed upon them.—("American Gardening.")

#### **Vitis, syn. Ampelopsis.**

Surely there is nothing to equal the well known *Ampelopsis* (*Vitis* of Linn.) and its varieties, for rapidly covering blank walls, arches, and trellises. Its best recommendation, perhaps, is that it adapts itself in most of its kinds to either a sunny or shady aspect. Care should be exercised when planting to secure strong plants, and to see that they are carefully planted without disturbing the roots any more than can possibly be helped. The plants are usually obtained in pots, and if strong, the roots will often be found to have grown considerably through the drainage hole. It is very much better to place the plant, as received, in position and smash the pot before covering over, making firm, leaving the roots to break through themselves when growth in their new quarters commences. *Ampelopsis hederacea*, the common Virginian Creeper, is perhaps the most vigorous grower. If care is taken in training it many an unsightly place may be covered up, where the more popular *A. Veitchi* (*V. inconstans*) would be a failure on account of its upward growth. *A. Veitchi* is undoubtedly an exceedingly pretty species, gaining its popularity no doubt through its self-clinging propensity, though there are others quite as effective in growth and colouring as the original. *A. Veitchi purpurea* is quite as hardy and vigorous, the difference being in the colour, which is of a purplish shade throughout the summer. *A. Veitchi atropurpurea* is even darker in colour. *A. japonica* Hoggi is a large-leaved, self-clinging variety, very vigorous, and has an attractive rich dark colour. *A. sempervirens* is a very close growing evergreen kind, but a weak climber, requiring a southern aspect. There is a variegated form, *A. quinquefolia variegata*, which requires glass protection; it is also exceedingly graceful when suspended. It should always be borne in mind that the *Ampelopsis* is a strong grower, and the better the cultivation the quicker will it spread, and the better the result in other respects.—J. W. J., Oswestry.

The Rock Garden, Birmingham Botanic Garden.

Scene in Birmingham Botanic Garden.

## Birmingham Botanic Garden.

Amongst the gardens sustained by private subscriptions and devoted to the practical application and exposition of botany, the one at Edgbaston, Birmingham, enjoys considerable esteem. In so large a city as the one just named, a "teaching" garden that provides representative material for the botanist, and furnishes lessons and leads the way in horticulture, is of the highest utility and much importance, so that for many years to come we may look to Birmingham Botanic Garden as one in the forefront.

We figure this week two views from the garden. The rock garden scene hardly could be expected to do justice to this fine feature of the fairly extensive grounds. It covers about an acre in all, and was artificially constructed by the late Mr. James Backhouse, of York. The work does that great gardener infinite credit, and a meed of praise was written several years ago in these same pages. The heavy and massive boulders are of sandstone, placed in position after Nature's model, and these are now clothed or partly screened with suitable shrubs and plants. In the centre of the scene, at the base of the main bank of rockery, and flanked by the lesser rock formations on either side, is a water pool having its complement of plants.

Engraven on a brass plate which is fixed upon a stone at one side of the rock garden, the visitor reads:

To commemorate the invaluable services to the society, first as honorary secretary, and later as chairman of committee, this purchase of ground, laid out for the reception of rock and bog plants, is named the Hugh Nettleford Alpine Garden. May 29th, 1895.

This is not the place to enlarge on the construction of rockeries, large or small; but it may serve a useful purpose if the names of the more prominent subjects are given. They include *Menziesia empetrifolia*, double flowering Gorse, various *Rhododendrons* (also *Azaleas*), *Spiraea palmata*, *Yuccas*, a collection of hardy Bamboos (*Phyllostachys viride-glaucens*, *Arundinaria nitida*, *A. Hindsii*, *A. pumila*, *Bambusa Metake*, &c.), *Ailantus*, *Smilax rotundifolia*, *Cotoneaster horizontalis*, *Veronicas*, notably *V. cupressoides*, and other shrubs. Amongst plants there are *Galax aphylla*, *Primula japonica*, *Iris pseudo-Acorus*, *Caltha palustris*, *Menyanthes trifoliata*, *Scirpus*, and other bog subjects; while in the period of the Daffodils this year we were further able to note in the general rockery *Iberises*, *Thymes*, *Sempervivums*, *Geraniums*, *Dianthus*, *Cistus*, *Muscari* (and many other bulbous flowers), *Orchises*, and *Hieraciums*. At the present season of the year there will certainly be a varied and most interesting display.

The second view depicts a view of a border near the range of glass houses. The keeping of these gardens will be in the best of hands, under the superintendence of Mr. Humphreys, the new curator, who goes there in October.

## Societies.

### R.H.S., Scientific Committee, August 4th.

Present: Dr. M. T. Masters, F.R.S., in the chair; Messrs. Hooper, Saunders, and Bowles; Dr. M. C. Cooke, Revs. W. Wilks and G. Henslow, Hon. Sec.

*Late-flowering Plums, &c.*—Mr. Hooper had noticed that various modifications occurred in flowers of fruit trees at the present time. Petaloid sepals and semi-doubling of petals with two carpels, forming twin Plums, were not uncommon. It was observed that in the common cultivated double Cherry there are always two foliaceous carpels present. Pear trees, &c., have also produced a second crop of flowers, which are borne on the ends of the young shoots instead of on spurs.

*New Crocus.*—Mr. Bowles exhibited dried specimens and drawings of *C. caspius* from Russian Talych, S.W. Caspian, with a white flower tinted with rose. He also showed the autumn-flowering *C. Scharojani* from the Caucasus. It is of an orange colour, and carries the leaves of the last season simultaneously.

*Papaver pavoninum.*—Mr. Wilks showed a plant from Central Asia (see "Garten Flora," 1882, page 296, Taf. 1095) remarkable for a crescent-shaped black band near the base of each petal.

*Cucumber diseased.*—Mr. Davis, of Bitton, Bristol, sent roots of Cucumbers which failed. Mr. Saunders reports as follows upon them: "I found that the extreme base of the stems were attacked by small worms belonging to the family Enchytracidae, which are nearly related to the earthworms, and are well-known pests at the roots of plants; they were undoubtedly the cause of the unhealthiness of the plants. Lime water will kill them in a few minutes if it can be made to reach them; thoroughly drenching the soil with this fluid might be of use, though I do not know what effect it might have on the plants. They, however are so injured, that I should imagine the best thing to do would be to pull them up and burn them, and burn or bury deeply the soil in which they grew."

*Cucumbers diseased.*—Dr. Cooke reported upon some fruit badly attacked received from the neighbourhood of Bristol. It appears to be due to a fungus new to science, which he has named *Cladosporium scabies*. A full description will be recorded in the "Journal" of the R.H.S. He strongly recommends "that all diseased fruits be removed and destroyed at once, and those remaining should be sprayed to preserve them from attack. Condy's fluid, diluted, should be tried as less likely to injure the fruits than copper solutions. No effort should be spared at once to stamp out the pest."

### Frome, August 3rd.

The twentieth annual exhibition of the Frome Horticultural Society was favoured with a record attendance, due to the popularity of the show, the Bank Holiday, and fine weather. Not only was there this increased attendance, but an appreciable extension of entries and certainly a higher state of all-round quality.

Groups, for which there were four entrants, were never better, indeed, probably not equalled before, and Messrs. Cray and Sons, who made their maiden entry in summer grouping, certainly eclipsed all former efforts. Lilliums, Campanulas, Cattleyas, Odontoglossums, Oncidiums, brightly coloured Codiaums, and a pair of very fine *Cocos Weddelliana* formed a combination both effective and choice. Mr. Pope, gardener to Charles Baily, Esq., was a very good second; Messrs. E. S. Cole and Son, Bath, and Mr. Cutter, gardener to Mrs. Le Gros, were given equal thirds. Specimen Fuchsias made a very good show, Messrs. H. Poeock, Hilpert, and W. Cooke staging in six varieties. Messrs. Strugnell (gardener to Col. Ralph Vivian) and Cutter won with specimen foliage plants. Messrs. Stokes and Son staged the best twelve Ferns or Mosses, *Alsophila excelsa*, *Asplenium nidus*, *Adiantum fragrantissimum*, *A. decorum*, and *Pteris Mariesi* being their finest plants. Mr. Pope was a good second. Mr. Geo. Tucker excelled with six specimen flowering plants, and also a single specimen. Groups of Tuberous Begonias were very fine in flower and effect, Messrs. Stokes, Fry, and Pope staging excellently.

Non-competitive groups from the Marquis of Bath (gardener Mr. A. Gandy) and the Earl of Cork (gardener, Mr. Pearce) were a striking feature in the plant tent. In the first named a margin of vigorous little specimen *Caladium argyrites* were much admired, as were also *Eulalias*, *Codiaums*, and Palms. The Marston collection predominates in brightly coloured *Codiaums*, and always commands well deserved praise from visitors.

Cut flowers occupy a deal of space, and despite the ungenial summer were as fine and numerous as ever. Roses made a good show, as also did annuals, Carnations, herbaceous, and stove flowers. Dahlias, too, and Asters, for so early a date, gave a bright touch of summer colour. With Dahlias in four classes Messrs. Cray and Sons, as usual, won easily.

Table decorations of wild and garden flowers creates a large interest among lady competitors, the spacious market hall for the time being transformed into a floral instead of a merchants' emporium. There were no less than seventeen entries in these classes. Prizes are offered to children who have made 80 per cent. of attendances at any Frome School, and the interest may be fairly gauged by the large entry, forty-four in numbers. Not more than three vases are allowed.

Despite the general shortness of fruit crops, the classes here were very well filled, and Apples, of which there were twenty-two entries, were particularly good. For a collection of six dishes of fruit Mr. Strugnell was first, showing as his best Pine-apple Nectarines, Triumph Melon, and Dymond Peaches. A. G. Hayman, Esq. (F. Ackland, gardener), was second, and J. H. Shore, Esq. (H. Parfitt, gardener), third. With black Grapes Mr. A. Taylor, gardener to A. R. Baily, Esq., staged some remarkably fine Black Hamburgs, and the same exhibitor won with Muscat of Alexandria in the corresponding class for white. The Fruit and Flower Co. won with fine Sea Eagle Peaches, and Mr. Strugnell with good Stanwick Elruge Nectarines. Mr. Fisher, Batheaston, took the lead with dessert Apples, and Mr. Keevil, Wells, scored with culinary. Messrs. Strugnell and Fisher staged the best collections of hardy fruit, and the first-named won with a Melon. Mr. Hall, Bath, with Grimwood's Matchless, won with Plums, really a good early kind of the Orleans type.

Vegetables were plentiful and uncommonly good, Peas, Potatoes, Tomatoes, and Cucumbers especially so.

### Sheffield Horticultural, August 3rd.

The annual show of the Sheffield Society was held under favourable conditions as regards weather and exhibits; but owing to colossal counter attractions proved a heavy financial loss, which is much to be regretted, after the efforts that have been put forth to secure a show worthy to rank amongst the best. The society is certainly to be commiserated with on its bad luck, but must be congratulated on the patronage it has secured, i.e., His Grace the Duke of Norfolk, who, with his

sister, Lady Mary Howard, twice visited the show during the day, and evinced much interest in some of the exhibits, particularly the Roses, and in response to the request of the secretary His Grace consented to become president of the society. Lady Mary Howard was delighted to accept, through the secretary, some lovely Roses from Mr. H. V. Machin.

**THE GROUPS.**—In all six groups were entered for competition. The first in the "Open to all" (150ft) was won by Messrs. Artindale and Son, who had some good Crotons, Lilioms, Carnations, &c. The first in the gardeners' groups (open, 96ft) going to Ald. Geo. Senior, J.P. (gardener, Mr. R. C. Baker), who had a very good collection of plants, Mr. C. Cook being second, and Mr. F. Pollard (gardener to F. Greenwood, Esq.), Pitsmoor, third. Very good plants were in this group, but these were somewhat lacking in colour.

**ROSES.**—In the class for twenty-four blooms Messrs. R. Harkness and Co., Hitchen, were again successful, lifting the challenge cup for the second time in succession. Messrs. Townsend and Son, Worcester, were a good second, and H. V. Machin third. In the class for eighteen Messrs. Townsend and Son were first, Harkness and Co. second, and H. V. Machin third. For twelve, dissimilar, the same exhibitors were again placed in the order named; while for twelve Teas Messrs. Townsend were again first, H. V. Machin second, and Harkness and Co. third. In the amateurs' class H. V. Machin took first in both classes; also for premier bloom with *Her Majesty*.

**Dahlias** were a short entry, but for dinner table decorations there were five competitors. Mr. Marsden, gardener to Major Blake, Ecclesall, securing premier honours. Mr. Wagg, Ossington Gardens, Newark, was second, and Artindale and Son third. Grapes were good in quality, as also Peaches and Melons. A class for fruiterers produced six exhibits of twelve dishes of fruit of good quality, and, considering the season, fruit and vegetables were good all round.

It is very noticeable that as a rule the local nurserymen hold severely aloof from exhibitions, and, though depending on the garden loving public for their patronage and support, they play a questionable policy in withholding all assistance in local shows. There are one or two praiseworthy exceptions in Messrs. Artindale, Seagrave, and Ellis, and to the two latter medals were awarded for non-competitive exhibits. Mr. Artindale readily admits the advantage derived in the way of trade from such exhibits.

### Dudley, Worcestershire, August 5th and 6th.

Favoured by fair weather, the second annual exhibition was held in Buffery Park. The show proved to be a great improvement upon the initial one held last year, partly due to the increased substantial prizes offered by the committee. It should be remarked, that owing to the unavoidable absence of the hon. secretary, Mr. H. Dickinson, during the day's proceedings, an efficient substitute was found in Mr. Wellings, one of the committee.

The £10 first prize for twenty stove or greenhouse plants was won by Mr. W. Vause, of Leamington, with several good specimens among them; second, Mr. S. Coster, gardener to E. J. Abbott, Esq., Handsworth. For a group of plants arranged for effect, the first prize of £12 10s. brought forth three contestants, and Mr. W. Vause won first honours; Mr. G. Hancox annexed the second; and Mr. W. Smith third. In addition to the foregoing, other collections of plants, such as *Dracænas*, *Fuchsias*, *Caladiums*, *Begonias*, *Gloxinias*, and exotic Ferns, were fairly well shown by several exhibitors.

There was a keen rivalry for nine varieties of hardy herbaceous flowers, and here Mr. J. H. White, of Worcester, led; the second going to the Vineries Co., Acocks Green. Bouquets and other floral arrangements proved to be a striking feature, as also Sweet Peas. Messrs. Perkins and Sons, Coventry, won the first prize in the class for a basket of cut flowers; second, Mr. S. Rose, Smethwick; and third, Mr. G. Hancox. For a collection of Cactus or other decorative Dahlias Messrs. Rowe and Sons, Worcester, won the first prize with a beautiful collection; and Mr. W. Pemberton second. For twenty-four Roses Messrs. Perkins and Sons easily scored; the second prize falling to Messrs. Townsend and Sons, Worcester; and third, Mr. H. Wright, gardener to W. Waldron, Esq. Prizes were offered for collections of Gladioli. Mr. J. H. White, Worcester, was awarded the first prize for a very good collection, being the only exhibit. Mr. H. A. Canadine, Stourbridge, was placed first, Mr. C. Crooke second, and Mr. A. R. Goodwin, Kidderminster, third.

For the best display of plants and cut flowers arranged for effect on a table (for nurserymen only), Mr. H. Davis, Stourbridge, was awarded the first prize of £5, and Mr. W. Vause annexed the second prize.

Fruit was fairly well exhibited. For four dishes of hardy fruits Mr. C. Crookes, gardener to the Dowager Lady Hindlip, Droitwich, was placed first, and Mr. H. Wright second. For two bunches of black Grapes Mr. C. Crookes was again to the fore with very good examples of Black Hamburgh; second,

Mr. George Hancox, West Bromwich, with two huge berried bunches; and third, Mr. C. S. Suich, gardener to J. Graham, Esq., Dudley. For two bunches of white Grapes, any variety, Mr. C. Crooke had very well ripened Muscat of Alexandria; second, Mr. G. Hancox; and third, Mr. C. J. Smith. There were some good Victorias, and for a white flesh Mr. G. Hancox was first, Mr. C. Crooke second, and Mr. E. A. Hall, gardener to Major Lanthorpe, Holmworth, Cumberland, third. For a scarlet flesh variety Mr. E. A. Hall was awarded the first prize; second, Mr. C. Crooke.

Mr. Crooke had a very fine dish of Peaches, and Mr. H. Wright, gardener to W. Waldron, Esq.

Considering the abnormally late season vegetables were very well shown. Messrs. Webb and Sons, Wardsley, offered prizes for six distinct kinds. The first prize was won by Mr. C. Crooke; second, Mr. H. Wright; and third, Mr. G. Taylor, Coseley.—W. G.

### Malton, Yorks, August 5th.

This society held its forty-fourth annual show in the Orchard Field, Malton, on August 5. The weather was somewhat threatening during the day, but with the exception of a slight shower or two, it was a beautiful day, and the exhibition was numerously attended. There was a slight falling off in some of the plant classes, but it was a very good show.

**PLANTS.**—The principal class was for six stove or greenhouse plants, dissimilar, in bloom. There were only two entries. Mrs. Kitchen, Darlington, easily secured first place with a very even lot and well flowered specimens. They were *Ixora Fraseri*, *Allamanda Hendersoni*, *Clerodendron Balfourianum*, *Bougainvillea glabra*, *Anthurium Andreanum*, and *Stephanotis floribunda*. Messrs. Simpson and Sons, Selby, were second. The same exhibitors were also placed in the same order for three ditto. Indeed, they carried off nearly all the prizes in the most important classes, which included six ornamental foliage plants, three ditto, and exotic Ferns. Messrs. G. Longster and Sons, Malton, had the best *Caladiums* and *Coleus*. A very good specimen Orchid, a *Cypripedium*, was staged by Mrs. Kitchen. There were also classes for *Pelargoniums*, *Begonias*, *Lilies*, and other plants, which were fairly well shown. The competition was keen for six plants for dinner table decoration in pots not to exceed 7in in diameter. Some splendidly grown plants were staged. Mrs. Kitchen secured premier honours, followed by Mr. McPherson, gardener to Earl Lonsborough, and Messrs. G. Longster and Sons. The same exhibitors also carried off the prizes for three ditto in the same order.

**CUT FLOWERS.**—The Show Dahlias were not so large as we have seen, and there was only one entry for twenty-four blooms. Messrs. Clark and Son, Rodley. The same exhibitor was first for twelve blooms. Mr. J. D. Hutchinson, Kirbymoorside, second. The latter was first for six Fancy varieties. Messrs. Clark and Son were first for Cactus Dahlias, Mr. G. R. Akester second. For six bunches of pompons Mr. Hutchinson had a nice stand. Mr. Whitehead, Appleton-le-Street, second. For twelve Carnations the Hon. Mrs. Duncombe, Nawton, took the lead. Messrs. H. Clark and Son second. Mrs. Duncombe was also first for six yellow ground varieties and six selfs. Messrs. Clark and Sons were the only exhibitors of twenty-four Asters. Sweet Peas were well shown, but the recent rains had somewhat spoilt many of the blooms. There were classes for twelve, eight, and four varieties, the Hon. Mrs. Duncombe being placed first in the first two classes, with fresh, lightly arranged exhibits; Mr. J. D. Hutchinson second. For four varieties the latter exhibitor was to the front, Mr. G. R. Akester second.

A good collection of eight varieties of herbaceous flowers was set up by Mr. J. D. Hutchinson, Mr. W. Dobson coming second. Roses were not so well shown as usual, Messrs. Harkness and Sons not exhibiting this year. For six varieties, three blooms of each, Mr. Hutchinson was an easy first, with fair blooms; Miss Cooper, Robin Hood's Bay, second. Mr. Hutchinson was also first for twelve and six blooms and six Tea Roses. Baskets of Roses were most tastefully arranged, the Hon. G. N. Dawnay first, Mr. Hutchinson second. Bridal bouquet: Messrs. G. Longster and Sons first, Mr. G. R. Akester second. These exhibitors were placed in the same order for hand bouquet.

**FRUIT.**—For four varieties Mr. McPherson was an easy first with Muscat of Alexandria Grapes, Bellegarde Peaches, Royal Jubilee Melon, and Smooth Cayenne Pine. Mr. C. Corner, Hutton Ambo, second; Mr. J. S. Upex, gardener to the Hon. H. W. Fitzwilliam, Wigganthurpe, third. There was only one entry for three bunches of black Grapes, the prize being taken by Mr. C. Corner. Mr. McPherson was first for three bunches of white Grapes, staging Muscat of Alexandria; Mr. Upex second with three good bunches of Foster's Seedling. The prizes for Peaches, Melons, Nectarines, and Apricots were won by Mr. McPherson, Mr. T. Hague, Carlton, and Mr. W. D. Horsley, Norton. The show of hardy fruit was very creditable for the unfavourable season.

Vegetables were good, but want of space will not allow details.

Messrs. G. Longster and Sons, nurserymen, set up a nice group of plants and cut flowers at the main entrance to the tent, for which they received an award of merit.

### Upton, Cheshire, August 5th.

This show was held in the beautiful grounds of Upton Lawn, kindly lent for the occasion by John M. Frost, Esq. There were two attractive groups, the first prize going to Mr. E. Stubbs, gardener to Major MacGillycuddy, of Bache Hall; and second to Mr. J. Ford, gardener to B. Glegg, Esq. Mr. R. Makefield, gardener to Miss Humberston, staged magnificent herbaceous flowers. The table decorations were strikingly attractive. Major MacGillycuddy and Miss Humberston staged Roses in very good form, the former also winning in the white Grape class, and for an unusually good collection of vegetables. Mrs. T. Willis Taylor had the award for Sweet Peas, whilst Miss Humberston scored for Melon, Cucumbers, Tomatoes, dessert Pears, and Celery. Mr. F. Richmond was successful with Black Hamburghs and a collection of fruit. A fine display of herbaceous plants and Roses came from Messrs. Dickson's, Ltd., Chester.—R. P. R.

### Midland Carnation and Picotee, August 6th and 7th.

The thirteenth annual exhibition was held in the Botanical Gardens, Edgbaston, and well upheld the traditions of the society. At the luncheon Professor W. Hillhouse referred to the absence of Mr. Robert Sydenham, who is sojourning in South Africa; also to the near retirement of the courteous curator of the gardens, Mr. W. B. Latham, who carries with him the esteem of all who personally know him. The hon. secretary (Mr. Herbert Smith) must be credited with success in the general arrangement of the show.

In the class for twelve selfs there was a keen competition amongst the seven combatants, the first prize being annexed by Mr. R. Chatwin Cartwright with a grand complement of blooms consisting of Ensign, Bomba, Sir Bevy's, Lustre, Comet, Seagull, Mrs. Eric Hambro, Mrs. C. Sharpin, Germania, Mrs. Prinsep, and Benbow. The second honours fell to Mr. A. W. Jones, Stetchford, with fine examples of Agnes Sorrell, Mueh the Miller, Sir Bevy's, Dudley Stuart, Mrs. Eric Hambro, Fredegonde, Britannia, Sultan, Benbow, Comet, Nubian, and Germania; whilst the rest of the prizes fell to Messrs. C. F. Thurstan, Wolverhampton; Thomson and Co., Birmingham; Mr. Martin R. Smith, Hayes; Mr. A. R. Brown, Handsworth; and Mr. Robert Sydenham, as in the order named.

For six selfs Mr. W. H. Parton, King's Heath, won with a charming set comprising Barras, Almoner, Nubian, and others; a good second being the Rev. C. A. Gottwaltz, Hadzor Presbytery, Droitwich, with John Pope, Richard Dean, Glowworm, and Lady Hermione. The remaining prizes fell to Messrs. W. H. Twist, Albert Chatwin, Edgbaston; Herbert Smith, King's Heath; G. F. Spittle, Solihull; S. Gibbs, Birmingham; and J. Fairlie, Aston, respectively as named.

For twelve yellow ground Picotees, dissimilar, there were seven contestants, the lead being taken by Mr. Martin R. Smith with fine examples of Franklyn, Countess of Darnley, Daughter of Heth, Lady Avebury, Coquette, Aphrodite, Countess of Verulam, Badoura, Morgiana, Isolt, Mrs. Walter Heriot, and Diana. The second prize was adjudicated to Mr. A. W. Jones with a very close lot; and the other winners were respectively Messrs. A. R. Brown, R. C. Cartwright, C. F. Thurstan, Thomson and Co., and R. Sydenham. For six blooms Mr. W. H. Parton led with Gronow, Hesperia, Mohican, Alcinous, Lady S. L. Oswald, and Gertrude; the second prize to Mr. A. Chatwin; and third, Mr. W. H. Twist, of Yardley. There were fourteen exhibitors in this class.

Keenly contested was the class for twelve Fancy Carnations, the pioneer being the Stetchford grower, Mr. A. W. Jones, with a magnificent box of Voltaire, Queen Bess, Argosy, Oakley, Alexandra, The Gift, John Sebright, Charles Martel, Eldorado, Brodick, Achilles, and Oberon. Second, Mr. R. C. Cartwright, with fine blooms, and Mr. Martin R. Smith third. In the class for six Fancies there was a strong "tug-of-war;" but the first prize went to Mr. W. H. Parton; second, Mr. W. H. Twist; the successful reservists being Messrs. J. Fairlie, the Rev. C. D. Gottwaltz, W. D. Rotch, Albert Chatwin, E. Charington, and W. Walker, in a complement of sixteen contestants.

In the class for twelve white ground Picotees there were six exhibits. The leader, Mr. F. W. Goodfellow, had beautiful examples of Amy Robsart, Lady Louisa, Miriam, Little Phil, Mrs. Gorton, Brunette, Mrs. Openshaw, Thomas William, Fortrose, Mrs. A. Brown, Harry Kenyon, and Pride of Leyton.

For six white ground Picotees eleven competed, Mr. D. Walker taking the lead with superb examples. A good second was Mr. E. C. Rossiter, Langley Green, with Thomas William, Brunette, Favourite, Fanny Tett, Little Phil, and W. H. Johnson. Excellent boxes were also staged by Messrs. Gottwaltz; J. J. Keene, Southampton; J. D. Williams, H. Boys, Walsall; S. Gibbs, and C. Chatwin.

In the class for twelve flake or bizarre Carnations there was a spirited contest, and Mr. C. R. Herbert (Messrs. Thomson and Co.'s grower) was to the fore with grand examples of Geo. Melville, Master Fred, Gordon Lewis, Geo. Rudd, Robert Houlgrave, Wm. Skirving, Guardsman, Robert Lord, Meteor, Sportsman, Mrs. Rowan, and George. The second position was accorded Messrs. Pemberton and Son, and the other successful contestants were C. F. Thurstan, A. R. Brown, J. Butt.

For six flakes or bizarres, there were nine entries, first honours falling to Mr. F. W. Goodfellow with a bright lot of blooms, the second prize going to Mr. D. Walker, and the remaining successful exhibitors in this class were Messrs. E. C. Rossiter, Wilson, Charles Chatwin, S. Gibbs, and E. J. Wootton, of Winchester.

Formidable was the competition in the classes for single blooms, there being twenty-two classes, with five prizes offered in each class. The society gave a silver medal to the most successful exhibitor in this section. For scarlet bizarres, the first prize went over the Border to the "Land o' Cakes," by that zealous "Carnationist," Mr. D. Walker, with a superb bloom of Robert Houlgrave; second, Messrs. Thomson and Co., with the same variety; third, Messrs. Pemberton and Son, also with the same. For a crimson bizarre, Messrs. Thomson took the lead with a superb Master Fred; also second prize with the same variety; third, Mr. D. Walker, with that standard old variety, J. S. Hedderley.

In the class for pink and purple bizarres Messrs. Thomson were again to the fore with George Rudd; second, Messrs. Pemberton, with the same; and the third to Messrs. Thomson with Wm. Skirving.

For a scarlet flake Mr. D. Walker led with Meteor, and was also second with Mrs. May; third, Messrs. Thomson and Co., with Meteor. For a rose flake Messrs. Thomson won the first prize with the invincible old Sportsman; whilst Messrs. Pemberton and Mr. F. W. Goodfellow won with the same variety.

In the class for a purple flake Messrs. Thomson annexed the first and second prizes with perfect flowers of Gordon Lewis; third, Mr. C. F. Thurstan, with the same variety. In the classes for single flowers of Picotees and Fancies, the heavy red edge section was strong, Brunette being represented in the first five exhibits. Here Messrs. Thomson were again to the front; second, Mr. E. C. Rossiter; and third, Mr. C. F. Thurstan.

For a heavy purple edge Mr. F. W. Goodfellow was to the fore with Mrs. Openshaw; second, Mr. D. Walker with the same variety; and Messrs. Thomson were third with Amy Robsart.

In the class for a light purple edge Messrs. Thomson were forward with a bloom of Pride of Leyton; also second with the same variety; and Mr. C. F. Thurstan third with a good bloom of Lavinia. For a heavy rose edge Messrs. Pemberton carried off the two leading prizes with Mrs. Payne; and Mr. F. W. Goodfellow had Little Phil for the third position.

For a heavy scarlet edge Mr. C. F. Thurstan was forward with Mrs. Sharp, securing the first and second prizes; and the Rev. C. A. Gottwaltz third with W. H. Johnston.

For a light rose or scarlet edge Messrs. Thomson and Co., Mr. D. Walker, and Mr. E. C. Rossiter respectively won with Fortrose. For a yellow ground Picotee Mr. Martin R. Smith secured first with a bloom of Mr. Walter Heriot; second, Messrs. Thomson and Co. with Mrs. Durant; and third, Mr. Martin Smith, also with Mr. Walter Heriot.

For a yellow ground Picotee, medium or heavy edge, Mr. J. J. Keen won with Gertrude; second, Mr. H. Boys with the same variety. For a yellow ground Fancy Mr. A. W. Jones scored with a fine example of Charles Martel; second, Mr. J. Fairlie with Brodick. For a Fancy Carnation, other than a yellow ground, Mr. J. Fairlie won with Dalgetty and Delightful in the first and second positions, and Muleteer was shown third.

In the class for single blooms (selfs) for a white or blush the first prize was awarded to Mr. Cartwright for a fine bloom of Ensign; and Mr. C. F. Thurstan the second and third prizes with Mrs. Eric Hambro.

For a yellow variety Mr. D. Walker won with Seymour Corcoran; second, Mr. Martin Smith with Goliath; and Mr. R. C. Cartwright third with Germania.

In the buff or terra cotta class Mr. Cartwright won with Mrs. R. C. Cartwright right off; he was also second with Benbow. A fine bloom of Edna, in the scarlet section, won the first prize for Mr. W. D. Rotch; second, Mr. Parton with Isinglass.

**PREMIER BLOOMS.**—These were represented by some exquisite specimens. Messrs. Thomson and Co. with Gordon Lewis (P.F.), Mr. F. W. Goodfellow with Lady Louisa, Messrs. Thomson and Co. with Pride of Leyton, Mr. A. W. Jones with John Sebright, and Mr. W. H. Parton with Gertrude.

Undressed and border Carnations and Picotees were unusually well shown. Bouquets and table decorations also formed a pleasing feature. In the former class Mr. W. B. Latham secured the first prize with a tasteful arrangement of pink coloured Carnations, and Mr. S. Gibbs stood second. The table stands of epergnes and vases were principally composed of Sweet

Peas, which materially contributed to the enhancement of this fine exhibition.

Silver-gilt medals were awarded to Messrs. Hewitt and Co., Solihull, for a grand display of hardy herbaceous flowers, which included several novelties; also half a dozen shower bouquets. To Messrs. B. D. Davis and Son, Yeovil, Somerset, for a fine collection of Begonias; and to Messrs. Felton and Son, Hanover Square, London, for their unique display of Carnations.

Large silver medals were awarded to Messrs. Dieksons, Ltd., Chester, for a collection of hardy herbaceous flowers; to Mr. J. H. White, Worcester, for a rich and large arrangement of hardy herbaceous and other garden flowers; and to Mr. Vincent Slade, Taunton, for a very fine display of cut Zonal Pelargoniums.

Small silver medals went to Messrs. Cutbush and Son for a collection of decorative Carnations; to Mr. William Sydenham for a large collection of Violas in exquisite delicacy of colouration; to Messrs. Pattison, of Shrewsbury, for an excellent display of Violas; and to Messrs. Simpson and Sons for an attractive display of the leading varieties of Sweet Peas.—W. G.

### Cornwall and Devon Shows.

#### ST. STEPHEN'S-IN-BRANWELL, CORNWALL.

A most successful show was held on August 5. There were 235 entries, sixty over last year. The quality was good, and called forth praise from the judges. Prizes were given for the best stocked and best kept gardens and allotments, and Mr. Hott said that, in all his thirty-five years' experience as judge, he had never seen a better garden than that which had won the first prize. This confession of the instructor in horticulture for Cornwall County Council is worth recording. Mr. I. J. Buscombe was the winner. For a collection of vegetables C. Parsons, St. Columb, led; second, J. Olver, St. Stephen's; third, J. Osborne. Collection of Raspberries, Currants and Gooseberries, first, J. Olver. Bunch of Grapes, first, J. Magor. Three early Cabbages, first, Mrs. Bennetts; second, W. H. Glenmow; third, W. Tregunna. Collection of Potatoes, four named sorts, six of each sort, first, J. Olver; second, M. Yelland; third, E. Robins. Collection of cut flowers, first, C. Parsons. Collection of vegetables, confined to farmers of the parish, first, J. Olver. There were some fine honey exhibits. Best swarm of bees (special prize, live, value 15s., given by Cornwall Bee-keepers' Association), T. Richards, St. Stephen's. About 700 paid for admission.

#### HALBERTON, DEVON, AUGUST 6.

The thirty-first exhibition of fruits, flowers, and vegetables was held recently. This parish is one of the best in Devonshire, rich deep soil prevailing, and Halberton is near Tiverton. Under the care of Prebendary Gregory and his wife the parsonage garden is one of the loveliest in Devon, and it is well worth a visit from people who are in the neighbourhood.

#### PORT ISAAC, CORNWALL.

The show was a great success, and nearly forty more exhibits were on the tables over the number of last year. The interest centres in the great improvement in cottage gardens. Flowers and flowering plants were not equal to last year's staging. The best was past, the show for flowers being a little late. I think that the idea of the committee was good, namely, a later show, in order to have better vegetables, which is educational. The judges were Mr. H. Osborne, of Wadebridge, and Rev. W. Townsend, of Delabole. Mr. Bennett and Dr. George, hon. secretaries, worked hard, and they, with the committee, must have been very gratified at the large patronage accorded. Dr. George said that the farmers had not responded except in two or three cases, but he hoped that another year the present praiseworthy example of the cottagers would have a salutary effect. Mrs. Conon, of Doiden Castle, distributed the prizes. Chief prizetakers were Messrs. S. Doidge, A. Mitchell, G. Bennett, Mrs. Hawke, and Miss Hyde. Dinner table decoration, F. Shannon, Miss Udy, &c.—X.

### British Pteridological.

The annual meeting of this society was held in the Institute, Bowness, on Monday August 3. There were present Dr. Stansfield (president) and a fair number of other members, both local and general. The minutes of the previous annual meeting were read and confirmed, and the secretary's and treasurer's reports showed the financial affairs of the society to be in a sound condition. The president, in his opening address, made reference to the gaps which had been caused by death in the ranks of the society since he last met the members, and expressed his pleasure at meeting many old and some new friends. He congratulated the society on the publication of the book of British Ferns, which had been compiled by members of the society, under the editorship of the late president, Mr. C. T. Drury, F.L.S., V.M.H., containing up-to-date lists, with details and dates of origin, of all

the best varieties of the various British species of Ferns. He urged the members to keep a watchful eye upon the book, so that in any future edition any possible flaws might be corrected, and new matter bearing upon the subject be inserted, so that the book might continue to be the standard work of reference upon the subject. Several of the chapters on apospory, &c., by Mr. Drury and others had never before been published in popular form, and would constitute a feature of great biological interest in the book.

The election of officers for the ensuing year was then gone through, most of the old officers being re-elected, but with some changes among the vice-presidents and committee. The place of meeting for next year was again fixed at Bowness, this being fairly central for members from England, Ireland, and Scotland, as well as being an attractive place of meeting from its natural advantages and surroundings. Two papers by Mr. C. T. Drury, F.L.S., were read, in the absence of the writer, by the president, their subject being "Varietal Types of British Ferns" and "The Propagation of Varieties of *Lastrea montana*." The president also read a paper of his own upon "The Study of the Abnormal." All three papers were received with applause and were evidently highly appreciated. A short discussion followed, in which Mr.

*Sarracenia* × *Stevensi*. (See page 150.)

Garnett, Mr. Phillips, Mr. White-side, Mr. Edwards, and others took part.

Mr. Garnett expressed his strong belief in the influence of environment in the production of varieties, and it was pointed out that there was a strong case in point in a beautiful crested form of Lady Fern which had been picked up last year in this neighbourhood by Mr. Phillips as a slightly abnormal but not crested form; during the year, however, that it had been under cultivation it had developed into a very fine crested or cristata form. The plant was exhibited by Mr. Phillips.

Mr. Garnett exhibited a very promising plumose setigerum form of *Athyrium*, but the Fern was not yet mature, and it was thought desirable to defer naming it for another year. Mr. J. Loveday exhibited some very finely grown crested forms of *A. f.-f. setigerum*; Mr. Henry Bolton, Mr. Loveday, Mr. Prager, and others exhibited fronds, all of more or less interest and importance. The sensation of the year, however, was a magnificent thoroughbred grandiceps form of *Lastrea montana*, which had been found within a few days in Longsleddale by Mr. Smithies. The certificate of merit of the society was awarded to this Fern under the name of *Lastrea montana grandiceps Smithies*. It is singular that Mr. Smithies is the only previous finder of a grandiceps form of *montana*. The present find, however, quite surpasses previous records of this type in this species, and is equal to the best grandiceps forms found in other species. The meeting concluded with votes of thanks to the writers of the papers, which, it was decided, should be published in the transactions of the society.

### Royal Scottish Arboricultural.

A meeting of the Royal Scottish Arboricultural Society was held in the Dumfries Showyard recently. The Earl of Mansfield, who presided, remarked that the Forestry Exhibition was very good, so far as it went, but expressed disappointment that it was not on a larger scale. Captain Walker, of Crawfordtown, took exception to the manner in which the exhibits were classified, and complained that of the four varieties of Pine for which prizes were offered, three—the Corsican, the Menzies Spruce, and the Douglas Spruce—were of recent introduction into this country. The Fir exhibits, he submitted, should be confined to trees which were of common growth in this country. Mr. Hay, Kilmarnock, remarked on the incongruity of grouping farm carts and field gates in one class, and said they ought to have separate classes for exhibits of distinct character. Mr. Robert Galloway, S.S.C., secretary, said the committee might remodel the premium schedules and classification of exhibits before another show. The proceedings terminated with a vote of thanks to the chairman.

The usual excursion general meeting of the society was held on Monday forenoon in Dowell's Rooms, Edinburgh. Mr. W. Steuart Fotheringham, of Murthly, presided over a good attendance of members, which included Lord Mansfield and Mr. Munro-Ferguson, of Novar, M.P.

### Scottish Horticultural.

The monthly meeting of this association was held in Dowell's Rooms, Edinburgh, on Tuesday evening, the 4th inst. Mr. McHattie presided over a good attendance of members. Mr. Bird, gardener, Raehills, Lockerbie, delivered a very eloquent and pithy little lecture, entitled "Twenty Minutes with Young Gardeners." Mr. Bird, in a pointed and lively fashion, addressed "the apprentice," "the journeyman," and "the foreman" in turn, showing the way they should each walk in their several spheres, and what they should all aim at if they hoped to be successful in after life. His advices were such as have often been given before, but not often in such an enticing garb—industry, study, good character, obligingness, and amiability. "When found take a note of" should be a maxim with every young gardener. "Keep your eyes open." "Don't be too anxious to work under glass," and strongly urged them to remember there was much more demand for the all round man than for the specialist.

Mr. Bird was listened to with rapt attention, and his lecture was received with great enthusiasm. An interesting discussion followed, taken part in, among others, by Mr. Comfort, Mr. Anderson, Mr. Smale, Mr. Todd, and the chairman. Mr. Todd warmly urged young gardeners to give more heed to the intellectual side of a gardener's equipment, pointing out that in these days, when there were so many openings for gardeners in connection with commercial horticulture, and through the increase of public gardens and parks in large towns and cities, it was necessary that the gardener should not only be a good cultivator, but a highly intelligent, cultured gentleman. A very hearty vote of thanks was awarded to the lecturer.

There were many interesting and beautiful exhibits on the table, from Messrs. Dickson and Co., Messrs. Grieve and Sons, Messrs. Todd and Co., Mr. John Downie, and others. A certificate of merit was awarded to *Dracaena Kewensis* shown by Messrs. Dickson as a mark of its highly useful qualities as a

decorative plant. A certificate was also awarded to Mr. Downie for a seedling Fancy Pansy (to be named). Mr. McHattie was warmly thanked for presiding.

### Lincolnshire Gardeners.'

On Wednesday evening, August 5, the members of the Lincolnshire Gardeners' Association turned out in good numbers in response to the kind invitation of Messrs. Pennell and Sons, to inspect their various trials of Sweet Peas, culinary Peas, &c., at their Bracebridge Nurseries. Arrived at the tramcar terminus, the firm had conveyances in readiness to drive the party to the nurseries. Both members of the firm were there to personally conduct the members round, and at once a move was made to the Sweet Peas, which were looking grand. Included in these were rows of all the newest varieties, and note-books and pencils were soon in requisition. Messrs. Pennell and staff were besieged with questions, which they readily answered. It would be difficult to find a collection in this part of the country to compare with this one, of this most popular flower.

It was not possible to have more than a glance at the choice collection of Roses, the multitude of fruit trees, shrubs, &c., which are so successfully grown here, and remarks were heard on all sides about the excellent condition in which this large nursery is kept, reflecting the greatest credit on the firm and staff alike. Refreshments were very generously provided by the firm, and after partaking of these, conveyances were again chartered and the party driven to the trial ground of the culinary Pea. The varieties here were simply bewildering. Old favourites could be seen as well as the latest novelties, and Messrs. Pennell and Sons are to be congratulated on winning such a reputation for this delicious vegetable. Mr. Wipf, in an interesting speech, moved that the best thanks of the members present be given to Messrs. Pennell for the kindness extended to the association, which was ably seconded by Mr. Kingan, supported by Mr. Bugg, and carried with enthusiasm. Mr. C. W. Pennell replied in a few well-chosen remarks, and hoped to see the members down at Bracebridge on similar occasions annually, which remark was greatly cheered. Conveyances were then entered, and the party driven to the tram terminus again, all being highly delighted with their most enjoyable and instructive visit.—OLD READER.

### Obituary.

#### Mr. Frederick Alex. Gardiner.

We regret to record the death, after a long and painful illness, of Mr. F. A. Gardiner, a noted Orchid grower and gardener in his day, who spent many years in the U.S.A., but latterly lived in Surrey, England. He was a brother to Mr. W. Gardiner, our Birmingham representative.

#### Mr. John S. Hedderley.

This fine old Midland florist, widely known in Nottinghamshire and Derbyshire, has recently died at his home, Sneinton, Notts, at an advanced age. He was one of a band of florists who made floriculture highly popular in the Midlands fifty years ago, having as his contemporaries E. S. Dodwell, Henry Steward, John Bayley, J. T. Wood, John Holland, John Heworth, W. M. Hewitt, and many others, who grew and exhibited Carnations in particular, when many villages had their annual exhibition. An amateur, he was a constant worker in his leisure from business, and he was a contributor to some of the floral publications of that period, and especially to the "Midland Florist and Gossip of the Garden." He was a warm supporter of the late Mr. E. S. Dodwell, and made a point of being present at the exhibitions of the Oxford Carnation Union, held in that city.

His name will be recorded for years to come by the fine and striking scarlet flake Carnation Sportsman, which sported in his garden from S. B. Admiral Curzon in 1855. The year following it took all the four leading prizes at the annual exhibition of the National Carnation and Picotee Society at Birmingham in the scarlet flake class, and it went at once to the top of the list as the best scarlet flake. At the recent exhibition of the National Carnation Society at the Drill Hall, on April 21, it took the first prizes in the scarlet flake class; while at the Midland Carnation Society's show at Birmingham on the 6th inst. it repeated its success of 1856 by taking, as it did forty-seven years previously, all four of the leading prizes in the scarlet flake class.

Mr. Hedderley also raised a charming rose self, named Royalty, which is now much grown for decorative purposes on long stems. His old friend, Mr. Dodwell, named a crimson bizarre J. S. Hedderley, and it is one of the most popular of the section, and is found in nearly all the leading stands at Carnation shows. Mr. Hedderley was an all-round florist, and grew Roses, &c., with excellent results.—R. D.

## Spot on Sweet Pea Plants.

Recently specimens of diseased Sweet Pea plants reached me through the Editor of the *Journal of Horticulture*, the plants being a complete failure, some of the seeds rotting in the ground, others of the young plants collapsing when only a few inches high, one shown in the figure at *A*, and others again flowering very indifferently, the foliage withering (part of such plant shown at *C*), and the flowers puny and spotted in the petals. On investigation the plants were found quite healthy at the roots, there not being any evidence of eelworm, and there were few nitrogenic nodosities (*c*), only a little cankerous affection on the root-stem of the plant *A* at *d*, and this not sufficient to account for the leafless condition of the young plant. The leaflet (*g*) had several pale spots, much more so than the rest of the sere and dry tissue, and there were a few pallid and dry spots on the stem (*f*), otherwise not any traces of disease, no "fruits" being discoverable in the tissues of the leaf spots, or in those of the stem, though a few very minute dark dots were observable in a spot on the stem when examined by a pocket lens, shown in *B* at *h*.

The older plants, a portion of one at flowering age shown in *C*, had the leaves very sickly looking, and with many pale spots (*ml*) on the whole, from the base upward. An affected leaf from the flowering part of the plant is shown at *D*, the spots being very pale, almost white, and the leaf tissue yellowish and sickly-looking. The spots appear on green, healthy leaflet (*E t*), and the remainder of the leaflet (*u*) soon assumes a yellowish hue, quickly becomes sere and withering, and not any "fruits" of the fungus were discernible in the diseased spots, these drying up and falling out. On the older leaves that had retained a certain amount of freshness, some of the spots contained minute blackish specks, shown in *F* at *v*, and a section examined under a low power of the microscope showed these to be perithecia, or conceptacles of the fungus, two immature and embedded in the diseased leaf tissue, *G* at *w*, and one mature perithecium (*x*) discharging spores. The spores are shown at *H*, and are referable to Pea spot (*Ascochyta pisi*).

According to Massee's "Text Book of Plant Diseases," Pea spot is "sometimes injurious to cultivated Peas (*Pisum sativum*), Haricot Beans (*Phaseolus vulgaris*), and species of *Vicia* and *Cercis*." It is also sometimes very prevalent on Everlasting Peas (*Lathyrus sylvestris platyphyllus*, syn. *L. latifolius*), completely withering up large portions of the leaves; but in these there seldom are any "fruits," and the same occurs in the bolder and fulsome leafage of Sweet Peas (*L. odoratus*). But though not uncommon on the leaves and stems, and even pods, the disease is seldom so

disastrous as to ruin the plants, as appears in this instance; but there is no accounting for diseases passing from relatively passive to a malignant epidemic.

The sender of the specimens had the same occur last year, and on newly broken up ground, so that there could not anything be attributed to disease from a prior crop. But the sward may have contained plants of *Vicia*, particularly of the Meadow Vetchling (*Lathyrus pratensis*), and the spores of the fungus present that infected the Sweet Pea plants. On the other hand, the burying down of the sward would be calculated to render infection less liable, and though some seed rotted in the ground, there is no evidence that the disease is carried over in the seed; yet as the fungus attacks the pods, it is not unlikely that seeds of the stunted and deformed examples may also be affected. It is possible for the disease plasma to pass over in the seed, and the disease to break out in spots on the leaves of the young plants. But on this point we have no data, or even on that of the disease being communicated to cultivated plants from diseased wildling *Lathyrus* or *Vicia*, though this is the most probable source of infection. Even what the resting stage of the fungus is has not been satisfactorily determined, its present form being probably a stage of a higher. It produces small pale spots on the leaves, stems, and pods, which become dry and brittle, and in the case of leaves eventually dropping out, giving to the leaf the appearance of having been riddled with small shot, and tiny perithecia are formed on the diseased portions. The effect is to greatly weaken, and in bad cases cause the ruin of the plants. That is about all that is at present known of *Ascochyta pisi*.

In the matter of prevention, not any means are recorded. It is likely that spraying with potassium sulphide solution, 1oz to 2½ gallons of water, would be useful, the sulphide being first dissolved in about a quart of hot water, and when dissolved adding 2½ gallons of soft water, in which 1oz of soft soap has been meanwhile dissolved. Well stirred, the solution, being cool enough, is ready for use. Spraying should commence as soon as the plants are well above the ground, repeating at intervals of ten days or a fortnight, so as to coat the foliage as made with the finest possible film of the solution, continuing up to the flowering stage.

Diseased portions should be burned, even the haulm of old plants, as it is likely the resting stage is in the dead plants, and the spores discharged from perithecia that form in the diseased portions, and in the spring and early summer infect any suitable hosts they may alight upon.

As the ground was new in the particular instance referred to, it is likely that a dressing of lime would have been useful, or, perhaps better, a dressing of basic cinder phosphate, 14lb per rod, along with 3½lb per rod of kainit, dug in and left until near

Sweet Pea plants affected with Pea spot, *Ascochyta pisi*.

*A*, diseased young plant, two-thirds natural size: *a*, radicle or tap-root sound; *b*, side roots and fibrolets clean; *c*, nitrogenic nodosities; *d*, small cankerous specks on root-stem; *e*, collar of plant or ground level; *f*, pale (disease) spots on stem; *g*, only leaflet on plant, quite sere, and with tissue dropped out of disease spots.

*B*, portion of stem of plant *A*, enlarged two diameters: *h*, diseased spot that has partly girdled stem; *i*, sound tissue.

*C*, root and portion of top of a plant arrived at flowering stage, two-thirds natural size: *j*, roots quite clean; *k*, nitrogenic nodosities; *l*, root-stem sound; *m*, stem above ground not spotted; *ml*, leaves diseased (with spots as shown).

*D*, leaf from upper part of plant, two-thirds natural size: *n*, stipules; *o*, petiole; *p*, leaflets; *q*, tendril; *r*, disease spots; *s*, pale yellowish green leaf tissue.

*E*, leaflet in early but decisive stage of disease, natural size: *t*, pale spots; *u*, apparently sound but sickly-looking portion of leaflet, the whole ultimately withering.

*F*, small leaflet from lower part of plant *C* seen from under side, natural size: *v*, disease spots slightly raised at circumference, and showing minute dark dots in tissue—the fruits (perithecia) of fungus.

*G*, section through portion of a diseased spot, *F*, *v*: *w*, immature conceptacles or perithecia of fungus; *x*, mature perithecium discharging spores,  $\times 50$ .

*H*, conidia (spores) of fungus, *Ascochyta pisi*,  $\times 200$ .

cropping time, then forking over. Food for the Peas would thus be supplied of a nature in which turfy soil is generally deficient, and thus the plants be fortified against the disease, or better able to resist its onslaught.—G. ABBEY.

## Gadding and Gathering.

### The Banner of Horticulture.

These passing years mark the opening period of a great horticultural expansion, an era when gardening schools and craft education and practice are being enormously developed. Cultures are becoming intensive and scientific, and from now, if never before, horticulture will date more and more as an industry, as vitally important as agriculture, from which it is, in its larger commercial aspects, divided by mere arbitrary definitions.

The "lesser horticulture" (to coin a phrase) comprises (1) all aspects of ornamental and decorative gardening; and (2) plant, fruit and vegetable cultures within the range of ordinary private household requirements. The ornamental and decorative phases of horticulture are varied and complex. They embrace landscape gardening (an art, the practice of which entails changes in the appearance of a whole landscape or district); the designing and upkeep of private and public grounds and parks, and the adornment of our persons, our apartments, our dining tables, our churches, theatres, and halls, and even the beloved dead, ere we commit them to the silent grave, we wreath with choice flowers of the garden. Such is the reach of the ornamental and decorative side of gardening.

The smaller cultures of fruits, flowers, and vegetables demand experience and wisdom on the part of those who endeavour toward the highest proficiency; but the responsibilities in the "greater horticulture" seem to us to be far keener, and fraught with consequences of more serious moment. The "greater horticulture" pertains to the successful, practical management of the extensive nursery gardens of our own and other lands, allying the bulb grounds of Holland, Japan, Bermuda, Scilly, Ireland, and the Cape; and again, the magnificent orchards of every civilised country. The vast importance of the great flower and vegetable growing centres has never been fully appreciated by us, for they have grown up in ratio to the increase of growth of towns and cities, and we have never contemplated what it would mean to be without them.

For our beef, and bread, ale and spirits, we are dependent on agriculture; for fruits, and vegetables, and for the floral and plant adornments of our social life, we depend on horticulture. Nor would our cities be habitable without their parks and boulevards. It is, then, an honour, a joy, and a recompense to be a gardener, a member, however humble, of the huge army of toilers and tillers who can claim allegiance to the banner of Horticulture, either in its "lesser," or "greater," applications.

### Gardening in New Zealand.

At the meeting of the Royal Horticultural Society on July 21, Mr. Geo. Hunt read a paper on this subject. In his remarks he named the Zonal Pelargonium, and stated that the original varieties taken out by early settlers had now become so naturalised as to grow wild, forming hedges in the North Island. All English flowers blossom profusely in Auckland.

Wine making has become an industry, and within a recent year 800 gallons had been made in one season at Auckland. This was estimated to be worth 5s. per gallon in the cellar, being two-thirds of the cost of the first vintage. It is hoped that the New Zealand Government will come forward and help the settlers.

The culture of *Phormium tenax* for its fibres, has been much developed. The plant deteriorates in the southern districts of the South Island, but does well in Auckland. The leaves are cut from the plant; they are macerated in water to rid them of the green cellular parts, and are then dried in the fields, after which they are shipped to England as hemp, to be manufactured.

The New Zealand climate is capable of producing the best fruits, but insect pests are very destructive in some plantations. Cider is a favourite drink amongst the farmers, though harvesters prefer tea, which they drink throughout the day. Strawberries can be profitably grown, and Raspberries are successfully cultivated in Nelson Province, in the northern part of South Island. Here one may see as much as twenty-five acres of one variety—the Red Antwerp—but American sorts are not in favour. The trade is done chiefly with Wellington, and small towns on the west coast; and jam factories have been established for preserving the fruits. So much as 5d. per pound is got at ordinary times, but in times of glut the price for Raspberries only realises 1d. per pound.

The rich, deep, loamy nature of the Canterbury Plain was mentioned, and it was observed that the finest varieties of Apples are grown here, and are so plentiful at times as to be allowed to rot beneath the trees. Mr. Hunt's paper was written on the voyage home from New Zealand, and it will be of much interest either to students of geography in its many-sidedness, or to intending immigrants to the "Britain of the Southern Seas."

He named a large number of plants and shrubs, describing the merits and uses, amongst them being the Allspice of commerce, and other species of Myrtles; also Pittosporums, Lime trees, Magnolias, besides Violas, Ranunculuses, Oxalis, and other subjects.—WANDERING WILLIE.

## THE BEE-KEEPER.

### Finding and Introducing Queens

One of the most perplexing problems to the novice is where to find the queen. In modern bee-keeping this operation has very often to be performed. The finding of one bee among so many is apparently very formidable; but, as a rule, if the hive is opened with as little disturbance as possible, and care taken not to alarm the bees, the queen will be found on one of the central brood combs, generally one of those where brood is just hatching. If she is not on the centre comb take out another, and so on until the whole of the bars have been examined. The fact that her body is longer and of a brighter colour, and that her legs are of a reddish brown tint, clearly marks out her royalty. If unable to find her the first time a second examination should be carefully made. She is, however, often found the first time, unless she is a black queen, which, being easily frightened, run into dark corners. There is little difficulty in finding Italian queens, as they are not disposed to hide, and their bright colours make them conspicuous. If a colony is in possession of a virgin queen it will show no signs of queenlessness, and there is an increased difficulty in finding her, as her abdomen is considerably smaller. In some cases, notably emergency queens, there is little or no difference between the virgin queen and a worker.

If doubtful or unable to find whether there is a queen in a hive or not, a ready method of ascertaining definitely is to place a frame of unsealed brood in the centre of the brood nest; and if queen cells are built thereon it is almost certain that there is no queen in the hive. The absence of eggs is not sufficient evidence that a colony is without a queen, and before treating it as a queenless colony or introducing another it is necessary to try the above unsealed brood test. Should the food in the hive be distributed without any sense of order it is a sign of queenlessness, or that there is an unfertile queen in possession, as immediately eggs are laid the honey will be moved and stored in the tops of the frames.

The principal factor in introducing queens is to know the exact condition of the colony. Caution is always necessary, especially if the queen is a valuable one. Where there are plenty of young bees the risk of introduction is minimised, as they take more readily to the strange queen. A stock of bees is in the best condition for receiving a stranger when it has been queenless from eighteen to twenty-four hours, or sufficiently long to know that they are queenless, and yet not sufficiently long to have started queen cells. Queens liberated from introduction cages by the candy eating method will, if placed over such a colony, be all right. When, however, queen cells are well advanced before the queen can be placed above, they should be excised, after which the queen may be placed over the cluster in her cage and liberated after the forty-eight hours. The hive should not be opened until two or more days have elapsed, and then care taken to see that the queen has left the cage. If not, replace it and close the hive for two days longer.

The chief difficulty in this branch of bee culture is brought about by the fact that queens are often required for re-queening queenless stocks, the bees of which are more or less old ones before their condition is discovered. In such a case, if the queen is caged over the cluster for a few days, until they are seen to hang loosely on it, and merely pass their tongues through the perforations to feed the queen, she may be liberated with safety. If a hive has been queenless for a long time always put a bar of young brood from another hive into it before attempting to introduce the queen; and if they start queen cells it will be proof that there is no fertile worker.—E. E., Sandbach.

### How to Commence Bee-keeping in Late Summer and Early Autumn.

I think it has been clearly established that it is profitable to keep bees, and there can be no doubt that there is much pleasure to be derived from the pursuit. The more one learns about these interesting creatures the more fascinated we become. Many of your readers, no doubt, would commence bee-keeping if they could do so cheaply, and only knew what to do. The skeppists will soon want to sell some honey or place it in some local show. Most of these people simply "keep bees," and are not bee-keepers. They will take the honey by destroying the bees over the sulphur pit. Make your own arrangements with these gentlemen, and generally they are

willing to give you the bees for the driving. This done, purchase a smoker, a very good one is the "Crane," a bar-frame hive, with "Weed" foundation (full sheets) securely fixed, and make quite sure they are *securely* fixed, and over these a quilt, with a feed hole about 3in in the centre.

**How to Drive.**—Place some brown unglazed paper in the smoker. I say paper because it is handiest usually, but rag, &c., or anything which will make a big smoke, will be equally suitable. When the contents of the smoker are well lighted, go to the hive to be taken, and puff a little smoke through the entrance; wait about two minutes. During the interval the bees are gorging themselves with honey, and will in consequence be easy to handle, for then they cannot, if they would, turn round the abdominal portion to the correct angle for stinging. Overturn the hive, and at once give a puff of smoke across the combs to drive down the bees. This warning is most important; omit it, and many stings may result; but if attended to, I will guarantee not a single sting will follow. Place the full skep mouth upward in an empty bucket. Over the hive to be driven place an empty skep, so that the rims of both coincide; hinge them together at the back, using a skewer, and fasten the sides up with the aid of driving irons. Stand with your back to the strong light and tap the sides of the full hive gently—gently, remember—with your hands or a piece of stick, and in about ten to twenty minutes the whole of the bees will be in the once empty skep. This operation is best performed about six in the evening. If you can possibly manage to get two or three lots to drive, so much the better; mix the lot together, and toss out in front of your hive.

**FEEDING.**—It will be necessary to feed them, and the more rapidly you can do it the greater will be the success you will achieve. They have cells to build, brood to raise, and to store sufficient food to carry them through until next May perhaps. Most of the failures among bees occur during the months of March, April, and May, when we have a stormy or wet spring.

**How to Make Food.**—Place about 10lb of white loaf sugar, with five pints of water, in a saucepan; stir well to prevent burning, and boil for a few minutes. Put this syrup, warm, in a glass jam pot—say 3lb—filling it more than full, and then tie down tightly with a piece of muslin and invert over the feed hole in the evening. Do not be led by bee-keeping friends to add chemicals which they know will prevent foul brood, for these will cause the bees to take down the syrup slowly, and no man knows of a case where foul brood, at any rate, has been cured by its aid. In order that the bees may be considered safe until the late spring they must have between 20lb and 30lb stored by the end of September at the latest.—HYBLA.

### Meteorological Observations at Chiswick.

Taken in the Royal Horticultural Society's Gardens at Chiswick, height above sea level 24 feet.

### Fruit Forcing.

**VINES: EARLY HOUSES.**—The Vines that have been forced to ripen the fruit in May and June have the wood ripe. Some of the leaves may also have fallen, which are generally on the wood first formed, as these from their texture are soonest exhausted in elaborative power. There are other causes for the leaves being shed early, such as attacks of red spider, insufficient supplies of water, scorching, and lack of nourishment. These must be guarded against, but under the best of treatment some of the lower leaves fall early from other causes than their thin texture, whilst the laterals, which are formed later, have stouter foliage. Such are useful in assimilating nutrient elements, some of which find their way to the leafless buds, as is seen in their plumping and in the thickening of the adjacent wood. The laterals must not therefore be cut close in, as that would probably cause the principal buds to start; but remove the growth by degrees, deferring the final pruning until growth has finished and the wood become ripe.

**RENOVATING THE BORDER OF EARLY HOUSES.**—When the Vines are weakly it is a good practice to remove the soil down to the roots and fork it out from amongst them, taking the opportunity of raising any that are deep, and laying them in fresh turfy loam nearer the surface. Good calcareous gravelly loam is the best, especially of a ferruginous nature, or one-sixth of lime rubbish may be added when lime and gritty matter is deficient and the soil is heavy. If the soil be very light and brashy, add a sixth of clay marl dried and pounded. A twelfth of wood ashes may be supplied with advantage, also a twenty-eighth part of basic cinder phosphate; and where the soil is poor a fifth part of fresh horse droppings. Other fertilisers are best applied as surface dressings. Give a moderate watering, when fresh roots will push, especially from near the collar, and be in capital condition to support a good start in the Vines when the time comes round. The border renovation, also lifting, should be performed whilst the leaves are on the Vines. If the weather is right the house will need shading and keeping rather close and moist for a few days. The work should be performed with dispatch, not operating until the wood is matured.

**MIDSEASON HOUSES.**—The Vines have had a fair amount of sunshine this season, though the weather has been remarkable for heavy falls of rain, which has not prejudicially affected outside borders where these are composed of sound open materials over thorough drainage; but in borders of close staple and rich materials the Grapes have shown an unusual tendency to shanking. On the whole the Vines have perfected or are ripening satisfactory crops. Where the Grapes are ripe air should be freely admitted, and enough afforded at night to insure a free circulation. If water is needed supply it early on fine mornings, as thus supplied, on days that promise to be fine, and with free ventilation, the moisture will not do any harm, but favour the keeping of the Grapes in sound condition. A slight shade is necessary to prevent the sun taking the colour out of Black Hamburgs and other black Grapes, especially when the foliage is thin. Grapes commencing to colour need a free circulation of air in the daytime, and enough at night to insure a change of atmosphere, a gentle warmth in the pipes often being necessary when the weather is cold or damp, both day and night. This is particularly necessary for Muscat of Alexandria and other thin skinned Grapes liable to "spot," a night temperature of 65deg being secured, and that of the day 70deg to 75deg by artificial means. Copious supplies of water and occasional applications of liquid manure will be needed until the Grapes are well advanced in colouring, and then the inside border may be mulched with short, dry, spent material.

**LATE HOUSES.**—Full supplies of water and feeding at the surface are necessary until the Grapes are coloured up to the footstalk, for many late Grapes appear ripe when they are only partially finished. All late Grapes require time and good support up to the finish. It certainly saves the Vines from undue strain, nourishes them in the growing time, and fortifies them in the wood and buds by the matter stored for the coming season's crop. The Grapes ought now to be colouring or advanced in that process, then, with a circulation of warm, rather dry, air constantly, and a thoroughly moist condition of the soil containing full supplies of available nutrition, they will swell and finish well. The chief cause of Muscat of Alexandria berries shrivelling, even before they are ripe, is poverty; also of others shrinking after they have hung some time. Afford a temperature of 70deg to 75deg by day artificially, 80deg to 90deg with sun, and

close sufficiently early to increase to 90deg or 95deg. When the sun is losing power afford enough air to insure a circulation, and allow the temperature to gradually cool, which prevents the moisture in the atmosphere depositing on the berries. The hot water pipes should, if necessary, have a little warmth in them to prevent the night temperature falling below 65deg, and this with a "crack" of air. Increasing this by, or before, the sun shines powerfully on the house, especially after a period of dull weather, may save the Grapes from "spot"; indeed, this is more due to defective ventilation than to fungoid infection, the spores not being able to germinate under well aerified conditions. Therefore we advise that particular attention be given to the ventilation of the house.—ST. ALBANS.

### Kitchen Garden.

**WINTER SPINACH.**—A liberal sowing for the main crop should be made between this date and the 20th of the month. Very rich ground is not essential, but it should be in good heart. Ground on which Potatoes have been grown is suitable. Fork over the surface and work in some wood ashes and a sprinkling of soot. The seed may be sown in drills drawn an inch deep and 15in apart. Either the round or the prickly-seeded Spinach will answer. In the event of the soil being very dry at the time of sowing, the drills may be moistened with water.

**CAULIFLOWERS.**—The present is a convenient time to make a sowing outdoors to secure plants for standing the winter and planting early in spring. Some of the seedlings when large enough may be pricked out to strengthen on a sheltered border, or in a frame, which can be afforded rough protection, as the plants must remain in such quarters or stand thinly on the seed-bed for the winter. Sow the seed on fairly good ground in an open position, drawing the drills not more than an inch deep and 6in apart. Moisten the drills if soil is very dry, and to ensure quick germination cover soil with mat, which must, however, be removed immediately seed germinates.

**TRIPOLI ONIONS.**—The first sowing may be made now. Select a piece of rich ground which, if loose, should be trodden firmly or rolled over. Draw the drills an inch deep and 9in apart, previously raking off stones to secure a fine surface. The Recca varieties are among the best.

**TURNIPS.**—It is best to make small but frequent sowings of Turnips, not all of which may do well. Snowball is as good for present as for spring sowing. Veitch's Red Globe and Chirk Castle Black Stone may be included. Moisture and warmth are essential for quick germination. Thin out earlier sowings.

**FEEDING BEANS.**—Scarlet Runner Beans with their rank growth and productive powers abstract a considerable amount of moisture and food from the ground. In order that the blooms may continue to set well and the pods to swell freely, moisture must be maintained. In addition, liquid manure may be applied, preferably when the ground is already moist, as it is then not wasted by passing beyond the reach of the roots. Another help in maintaining the plants in bearing condition is to freely pick the pods, allowing none to grow old. A good mulching of manure will conserve the moisture and render watering less necessary.

**BROCCOLI.**—Any plot of ground that has become vacant may be planted with the later varieties of Broccoli. It is not necessary to dig up the ground, but it should be cleared of weeds and rubbish. Then plant short sturdy plants, using a crowbar if necessary to make the holes, as Broccoli requires firm ground, so that the growth may be continued sturdy and of a character suitable to withstand the wintry weather. If moisture is required water with liquid manure. This will enrich the ground and produce abundance of rootlets. The necessary culture with the hoe to keep down weeds must be practised, this also encouraging growth. Liquid manure will not be required after the plants are established.

**CABBAGE.**—To make sure of having a stock of plants not too far advanced in size another sowing should be made thinly in drills or broadcast. They may be drawn from the bed direct and planted, or the smallest may remain in the seed-bed for spring planting.

**LETTUCE.**—A good Cos variety of Lettuce to sow for standing the winter is Black-seeded Bath Cos; Hardy Hammersmith and All the Year Round being excellent Cabbage varieties. Sow thinly in shallow drills.

**ENDIVE.**—A late sowing may be made of Endive and seedling plants from previous sowings planted out. Those which are large enough for blanching may have inverted pots, slates, or tiles placed over them when in a dry condition.—EAST KENT.

### Tree Planting in the Transvaal.

The Transvaal Educational Department has decided to set apart one day in each year for tree planting for the children attending the Government schools.

## TO CORRESPONDENTS

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**PHOTOGRAPH RECEIVED** (Robt. Ogston).—We received the photograph safely, and regret not having acknowledged your kindness. We shall use the photograph if possible, and will let you know shortly.

**APPOINTMENT AT THE ROYAL GARDENS, KEW** (F. W. C.).—Apply by letter to the Director, who will cause a form to be sent to you, which you may then fill in. This form explains the position of applicants.

**BOOKS WANTED** (F. L.).—The books you seek are Lewis Castle's "Packing of Fruit for Market," 1s. net, with postage, from Messrs. Collingridge, 148, Aldersgate Street, E.C.; and G. Bunyard's "Fruit Farming for Profit," also 1s., we believe, from the author. Get Collingridge's "Vegetables for Profit" series, price 1s. each.

**INDIARUBBER PLANT WITH HOLES IN LEAVES** (M. J. P.).—The injury would probably arise from sun-spot burnings; at least, strong direct heat causes the leaves to crack and become spotted. Try a moderately light position out of the direct sun; give the plant abundance of water (seeing that the drainage is free and perfect), and avoid cold draughts.

**CHRYSANTHEMUMS** (W.).—You had better take the crown buds as soon as they form by removing with great care the surrounding growths; but if the slightest injury is done to the buds it will show itself more and more as the buds swell, and the bloom will be imperfect. All the axillary growths should be removed from the stems of the plants, and suckers from the roots.

**PLAN AND DIMENSIONS OF BOXES TO CARRY GRAPES FOR EXHIBITION** (Q.).—You will find such information as you require, and at greater length than we can afford space for here, in our issues of January 29, 1903, page 103; and February 5, 1903, page 129, with illustrations. The cost of copies of each date will be 4½d. each, post free from our publisher.

**ROSES BLOOMING UNHEALTHILY** (J. M. W.).—We should attribute the "blue tint" of the red Roses to the cold, unfavourable, wet weather, and especially to the effect of the great rainfalls on your soil, which you describe as "of a heavy nature." The potash and probably iron salts from the soil will not have been sufficiently elaborated in the petals and leaves; thus the blue tint.

**OLD BOOK: VALUE OF** (J. M.).—We should think 5s. to 6s. a fair price for a seventh edition of Bradley's "Gardening," 1739. We have not seen the book, however, and would suggest your inquiring at a dealer in such books—possibly Wesley and Son, Essex Street, Strand, London. Old gardening books have recently risen much in price, as witness Parkinson's "Paradise in Sole," which a few years ago sold commonly for 3s. 6d., and is now fetching up to three guineas.

**WEED ON LAWN AND ITS EXTERMINATION** (C. M. H.).—The weed is one of the Lesser Trefoils, either the Yellow Suckling Clover or Lesser Yellow Trefoil (*Trifolium minus*) or the Hop Trefoil (*T. procumbens*); but in the absence of flowers we are unable to say definitely, the specimen being much withered. It may be destroyed by dressing the lawn with a mixture of equal parts sulphate of ammonia and nitrate of soda, applying 1lb of the mixture per rod (5½ square yards, not a square rod, 30½ square yards) several times during the summer, or at monthly or six weeks intervals from April to September inclusive. The mixture will gradually destroy the weed by its action on the leaves, also Daisies and other broad-leaved weeds, it being better to repeat the dressing than to give a greater quantity at one time than that mentioned, and though it may at times brown the lawn somewhat by destroying the undesirable herbage it will soon recover, the grasses being encouraged by the dressings, while the weeds gradually disappear. The advertised lawn sand will also answer the same purpose, killing the Clovers and other similar plants that grow at the expense of the more desirable grasses, the latter being the chief things to aim at, especially in a lawn used for croquet, tennis, &c.

**BOTTLING PEAS (W. H. Cook).**—We shall reply fully in our next.

**MANAGING AN ESTATE (F. L. S.).**—You would find considerable help from a perusal of the book entitled "How I Managed and Improved My Estate," published in 1886 by Geo. Bell and Sons, of Covent Garden, London. This deals with the choice of an estate, with underwoods, timber, building and quarrying, making grounds, farming and shooting, fish ponds and aviaries, as recorded from Sussex. The work is certainly useful and interesting, though not necessarily a guide book.

**MILDEW ON ONIONS (O. S.).**—Onions are occasionally attacked with a form of mildew peculiar to the crop and it is very destructive. We should try the effect of syringing them with a solution of softsoap and sulphur, dissolving the soap at the rate of 2oz to a gallon of water, then heat some sulphur into a paste and mix it in the solution till of the consistency of thin cream, yet not so thick that it cannot pass readily through the nozzle of a syringe. If that does not check the mildew and the tops wither the bulbs had better be pulled up, dried, and stored, burning the tops. It will be advisable to have your Onion bed in another part of the garden next year.

**POISONING SQUIRRELS (A. T.).**—An American friend reports being very successful in killing the squirrels on 3,500 acres of land by thorough and systematic poisoning. He believes his method not only more effective, but quicker than the use of bisulphide of carbon. The poisoning should be done now, and his way of preparing it is to mix one ounce of strychnine, one half ounce cyanide of potassium, and two pounds of sugar, well dissolved in water, to one gallon of wheat; the whole to be stirred until thoroughly mixed, and let stand overnight to allow the wheat to absorb some of the poison ingredients. The ground is gone over three times each year, the quantity of strychnine being reduced after the first time.

**INSECT THAT DEPOSITED EGGS ON GARDEN NETTING FIXED ROUND TENNIS COURT (J. F. C.).**—The eggs on some of the specimens had hatched out, the larvæ or caterpillars being very lively and very hairy, swarming on opening the small box, and with their large heads evidently bent on foraging. The eggs, and of course larvæ or caterpillars, are those of one of the Tiger moths, we think the cream-spotted Tiger moth (*Arctia villica*); but it is extremely difficult to tell definitely from the eggs and newly hatched larvæ, for the latter are very small and much alike when very young; indeed, those of the common Tiger moth (*Arctia caja*) are very similar to those of the cream-spotted Tiger moth. The caterpillars feed for a time on low plants, not very particular as to what, but as a rule prefer wild to cultivated plants, having a penchant for Docks, Plantains, and other weeds, and hibernate early in autumn. In spring they feed up, and when full grown spin slight cocoons on the food plants, or among dead leaves and surface rubbish, and in them become pupæ, from which the moths emerge in two or three weeks. The moths usually appear about July. The species of the most common occurrence in gardens are the Common Tiger and the Ruby Tiger (*Phragmatobia fuliginosa*).

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (W. W.).—1. *Heracleum sphondylium*; 2. *Epilobium montanum*. (B. B.).—*Nigritella angustifolia*. (C. S.).—*Echinops*, we cannot readily name the species without foliage. (A. T.).—1. *Acacia mimosaefolia*; 2. *Platycodon grandiflorum* *Mariesi*; 3. *Campanula macrostigma*. (L.).—1. *Salix alba*, the Huntingdon or White Willow; 2. *Salix fragilis*, the Crack Willow; 3. *Salix daffnoides*; 4. *Salix Caprea pendula*, the Kilmarnock Weeping Willow; there are some eighteen British species of Willows. (J. T. M.).—1. *Vitis Coignetiae*; 2. *Vitis* (or *Ampelopsis*) *inconstans*.

## Liver Rot Amongst Sheep.

This is one of the most destructive enemies of the farmer, and many a one has been half ruined by a serious attack of it, for it does not merely decimate, but annihilate if it is not discovered in time. Fortunately, the life history of the liver fluke, the parasite which can work such wholesale destruction, is well known to agricultural scientists, and to the majority of farmers, and damage from it may be fully guarded against. Low lying grass land is especially liable to be infested with liver fluke, and a farmer moving from a high to a lowland district may easily suffer a great loss through having had no previous acquaintance with the fluke. Without a stagnant ditch, pond, or swampy ground in it, a field cannot be liable to be infested with liver fluke, and the reason for this can be clearly understood if we briefly study the history of the parasite. The eggs of the liver fluke are laid in the livers of sheep, from whence they pass away in the dung; but they do not hatch until they reach water, and may remain dormant for a considerable period under dry conditions. Having been hatched in water, they swim about until they come across a particular species of snail to which they attach themselves. They afterwards enter its body, where they grow, and in course of time emit other organisms which enter and live upon the liver of the snail; these again produce further organisms, similar to the original fluke; they pass out of the snail and swim about until they attach themselves to a blade of grass and wait there until with the grass they are swallowed by a sheep, whose liver they at once proceed to occupy.

The whole of these changes are so slow, and the effect on the sheep is at first so imperceptible, that a farmer must be very wide awake to discover it before irreparable damage has been done. We have had some experience of the ravages of liver fluke both amongst our own stock and that of neighbours, and have found no cure for sheep once infected; it is therefore the more necessary to use every preventive measure.

A careful reader will notice that in the short history of the fluke given above, the parasite in two of its forms is mentioned as swimming about waiting for a lodging, also the host to which it specially attaches itself is a water snail; therefore, in using preventive measures we must not allow our sheep access to pastures where there are pools of water in which the fluke may have been reared, or must use such means as will destroy the activity of the enemy. To this end there is nothing better than common salt, and we should strongly advise farmers to give a heavy dressing of it to any pastures which abound in marshy places.

Of course, drainage must be attended to, and boggy spots may be much improved thereby, but still there are large tracts of land which lie so low that a wet time converts them into swamps, in spite of every effort made to get the water away. It is on such land that the use of salt is such a safeguard. But there are many farmers who have dry as well as wet pastures, and are able to choose the time for stocking each field. Well, in such cases we should say use salt on the wet land, but do not put sheep on it after midsummer until there has been a real frost. We believe that a careful study of the history of the liver fluke shows that its progress is so slow that there is practically no danger of sheep becoming infected with it before the month of August, but that after August has come in the danger increases day by day until there has been a frost, which can deal death to the parasite. We know farmers of large mixed holdings who never put sheep on their low lying, marshy grass land until there is no mistake about the advent of winter.

But there is the danger of infection from ponds and watercourses even in hilly districts! Certainly! but the danger is a very small one, and there should be little or none if ponds and watercourses are well scoured out and no vegetation allowed to exist in them. They may also be fenced off, and in the case of ponds it is a plan we should recommend. But someone says, "Oh! I wish my sheep to have a supply of water." Well! they can do very well without, and they are very much better without than to run any risk of contamination with the liver fluke.

But what are the signs of contamination? As we said before, it is very difficult of detection unless we are warned, and therefore on the look out. The fluke infests the liver, but its food, strictly speaking, is the blood; and as soon as it obtains a habitation in the system of any sheep a constant and unending draft on the vitality of that particular animal is immediately set up. If, therefore, a flock of sheep is seen to cease thriving, and show signs of debility, the possible presence of liver fluke must be one of the first questions to be investigated. An aggravated, or perhaps it might be better to say an advanced case of liver rot, can be most unmistakably diagnosed by one symptom. If the shepherd turns up the eyelid of the sheep the eyeball will be found of a bluish white, without any sign of the existence of a vein, whereas the eyeball of a healthy sheep will show a beautiful network of veins.

If a sheep is discovered infested with this disease, there is only one cure, i.e., the knife. A breeding flock is especially liable to attack, because grass land is so suitable in other ways for it; but if symptoms of fluke be discovered the best plan is to kill and market the lot at once, for the ewes will gradually lose flesh, few will live to rear a healthy lamb, and none will survive to breed again.

### Work on the Home Farm.

There is still plenty of work amongst the Turnips, for there has been rain almost daily, and it has been most difficult to make a thorough job of them. The showery weather has put harvest back quite a week, so there is still time to get the cleaning done if the weather would but take up.

Grain crops have suffered further from the heavy rain, and are now in many cases hopelessly twisted about, and present a problem to the binders. It is a pity that harvest should have been made more difficult, for both Irish and English harvesters

of experience are difficult to find, and the out-of-work townsman without rural experience is of little use amongst heavy laid crops. The chief damage to the corn will be in the increased cost of harvesting, for the ears are plump and well fed, and will ripen well with more sunshine.

A journey through a neighbouring county this week revealed a very different state of things. No laid corn there, but a great shortness of straw, harvest approaching rapidly, and many fields of late sown Turnips not yet touched by the hoe. We came home much consoled and reconciled to our own minor troubles.

One thing attracted our notice during this journey, viz., the frequency with which we passed large stacks of hay and clover, particularly the latter; and although there was an abundance of aftermath, we noticed very few sheep. Are these farmers all crazy speculators in hay, or are they short of capital to invest in sheep? These paying little animals are anything but cheap now, but there is plenty of room yet for a big profit, and we fancy that buyers at our local fair to-morrow will find that they have invested their money well.

It will soon be time to wean early foals, and if the mares are required to do much work during harvest it will be well to separate foal and dam at once, and get rid of the mare's milk before she is again put into hot and heavy work. When a foal is first weaned it should be closely watched, as some excitable young animals are liable to do themselves serious injury if left alone and unattended, until they settle down and become reconciled to the new conditions. It is safer to leave two foals together; they will be company for each other, and be far less liable to injury.

### Suburban Poultry Keeping.

The number of suburban poultry keepers has increased enormously during the past fifteen years, and it has been estimated that fully one-third of the eggs produced in this country are now obtained from this source. Suburban residents living in detached or semi-detached villas are as a rule obliged to confine their feathered stock within very narrow limits, such as small wired-in enclosures of 20yds or 30yds square. But can fowls under such circumstances be kept at a profit? I am satisfied that in nine cases out of ten they are kept at a loss. Why is it, then, that so many are kept? They are kept as a hobby, and any loss that is made is more or less compensated by the pleasure of possessing such live stock and securing home laid eggs warm from the nest.

There is, however, one way, and I believe only one, by which a few fowls can be kept at a certain profit, although closely confined; and if it were more generally practised, the number of suburban poultry keepers might yet be increased tenfold. Instead, then, of attempting to rear chickens, or to keep any adult fowls all the year round in confined enclosures, let the poultry yard be tenanted with stock for six months only, from the middle of February to the middle of August. Purchase in February, say, a dozen pullets or one year old hens of a non-sitting breed, such as Leghorns, Andalusians, or Minorcas. During the following six months these fowls will lay quite four-fifths of the eggs that can be expected from them if kept the full twelve months. We therefore get a maximum of eggs during these prolific egg laying months at a minimum cost of food and labour of attending. The fowls when bought in may cost from 2s. 6d. to 3s. 6d. each, and when sold out in August will commonly realise from 1s. 9d. to 2s. each, as they will then be in good condition for killing. All surplus eggs laid during the summer should be dropped into water glass, lime pickle, or otherwise preserved for autumn and winter use. By adopting this simple plan you escape the six unprofitable months in all poultry yards, and in too many instances the handsome profit made during the spring and summer months is more than eaten up during the autumn and winter.

Again, very few people are successful in keeping fowls in small enclosures, however well attended, in either health or profit for twelve consecutive months, to say nothing of the increased labour and misery of attending to such stock in all weathers through our inclement winters. No fowls produce so many eggs during the laying season as those confined in suburban runs. This is owing to the better care and attention which they receive, the shelter afforded, and the table scrap food which is so conducive to egg laying. The best varieties of fowls for egg laying are now so generally and largely bred throughout the length and breadth of our land that there can be no difficulty in securing a dozen head or so of suitable stock, and at a moderate price, to place in one's pen in the spring of each year. There are probably a quarter of a million amateur poultry keepers who, by adopting this suggestion, may convert a loss into a certain gain, as well as avoid the many diseases which sooner or later bring disaster to all poultry keepers who attempt to do too much upon a limited space.—K. B. BAGHOT DE LA BERE, Burbage Hall, Leicestershire.

## Table Decoration.

IN this, as in every other department of the decorator's art, we find tastes differing and fashions ever changing. For these reasons it is a most difficult matter to set up a standard work which, for any appreciable length of time, can be of utility to the operator, whether he be an expert or a novice. Some great ladies have distinct and original ideas of their own, and for them any rigid formula would be useless.

The same remark equally applies to many decorators who are also gardeners. There are still people who love to see their tables converted into miniature flower shows, and to have them dressed in a mass of glowing, heavy colours. On the other hand, it is a matter for pleasant contemplation to find a growing desire for grace and simplicity.

Reference has been made to the difficulties to be met with in bringing out a durable work on this subject. Such books, are, I believe, seldom met with, but one was, some years ago, placed in my hands in the hope that it might be found useful in what, at that time, was my daily avocation. Many of the designs and notions it contained were far too heavy and intricate at that date, and I fear that nowadays the bulk of them would be pooh-poohed and made light of. But it would be unfair to say that modifications of some of the ideas in the book were not of great assistance; they were indeed, a few of them, of very real help.

To see tables dressed to perfection they should be seen when prepared for a large party in the height of the season at one of the great London houses. When arranged as only a first-class West-end florist can arrange them, they are sufficient to send a poor country decorator back in despair to his humdrum ways and a survey of the impossibilities

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

existing in his task. For it certainly is impossible for any gardener of my acquaintance to employ numbers of women daily, mounting, arranging and designing. Still, with the time and material he has at hand, the common or garden decorator may produce, with a little care and forethought, some charming effects.

I notice a writer in a contemporary advocating the claims of the *Schizanthus* as a table flower. In a cut state this is undoubtedly very light and graceful, and in daylight is certainly beautiful; but under artificial light it wears a most dejected and washed-out appearance, owing to the tints not being sufficiently clear and decided. This, however, can scarcely be looked upon as coming under our heading of "summer decorations," and is merely noted as a warning, to show that what is most elegant and suitable at the luncheon hour may be at dinner-time a disreputable-looking object.

At this season of flowering plenty it is scarcely necessary to speak of the use of plants for the table, as few people care to see them unless they are used as a change. With Sweet Peas, Roses and Carnations, besides a host of other flowers now given us in profusion, it is a wise plan to take this season for the rest and preparation of small decorative material which will be of service later on in the year.

Roses, when grown in large numbers, form a means of supply upon which we may draw to carry out an almost endless number of ideas. The common Monthly or China is far more effective for decorative work than would be readily credited by those who have not seen the rich pink blossoms used on a large scale. From strong-growing dwarf plants long stems can be cut, which answer well for arranging in vases, about five of these (one large for the centre and four smaller ones) being a sufficient number for quite a large table, if a simple design of flowers and foliage is placed upon the cloth. W. A. Richardson, if procurable in quantity, is another variety that commends itself to notice if a table is desired to be dressed in one colour. Unfortunately, that fine golden tint, so much admired, is not always to the fore, and the blooms themselves are frequently misshapen and ragged; but when procurable in fine form a very beautiful table can be set out with this Rose.

Euphrosyne, one of the Rambler class, would, upon first appearance, scarcely commend itself to every decorator; the large clusters of small pink flowers giving a sense of clumsiness. But with care in arrangement, delightful results may be obtained by its use. It has, however, a brief season of blooming, and there is not much danger of a too frequent repetition in using this Rose.

Many different sorts of various colours may be mingled, and very few there are that clash one with the other. In any case, whether mixed or in separate colours and varieties, the flowers ought to be set up with Rose foliage only. No other that I know suits them so admirably, and though no stickler for "flowers with their own foliage"—an idea so ardently pursued by some—here is certainly an instance where the idea holds good and has much to recommend it.

Turning to Sweet Peas, what a wealth of material is provided by these flowers for the decorator's art. Lady Mary Curie and Salopian are fine for effect under lamp or candle-light. Those who love brilliance may well try Gorgeous, but this I think too glowing in hot weather. Mrs. Dugdale and Lovely are both charming for a pink table, but some of the lighter tints with the blues are anything but showy for the evening. They have their uses for daylight purposes and are so beautiful that we cannot afford to ignore them. Rather narrow glasses are best for these flowers; a sufficient number can be efficiently arranged in a rather small vase, and as the greenery used with them must be of the lightest, it is obvious that the use of wide receptacles would only result in loose, unsatisfactory arrangement.

Gypsophila and unripe Grasses are frequently used with Sweet Peas, and both can be made to look eminently suitable, but nothing, I think, equals their own shoots in effectiveness for this purpose. For tracing I have many times used Smilax, and though this by most people is found satisfactory, I infinitely prefer to use healthy growths of the Peas, as being more in keeping with the dainty blossoms.

What can be said of Carnations which has not already been many times uttered? Malmaisons we now have in many shades of colour, but the old pink and blush are still as grand as ever for table work, and for that ancient veteran, Raby Castle, nothing but praise can be given. Germania, when it thrives properly, is difficult to beat as a yellow. For mingling with the blooms, fronds of *Adiantum* are quite per-

missible, and will provide a light and elegant setting; so will young growths taken from the *Asparagus* beds; but if a bolder and more decided effect is desired, then use healthy, but not too robust "grass" or pipings.

Much could be written of the claims of other flowers. Of Coreopses, of long spurred *Aquilegias*, *Rudbeckias*, *Allamandas*, some of the *Cattleyas*, and hosts of others that well deserve a share of notice. All and each may be relied on to render service where provision is made for their cultivation. Most of the plants mentioned will be within the reach of nearly everyone possessing a garden, and will give ample scope for the display of ability in decorative arrangement. Let me add, in conclusion, three points which must be earnestly striven for—lightness, grace—and though these two in perfection may be thought by some to insure the last, let me also add, proper effect.—PROVINCIAL.

## Early Potatoes from Ireland.

Under the inspiring influence of an energetic and well-staffed Department of Agriculture, which has large sums of money at its disposal, the Green Isle is "forging ahead" in every way except in the matter of population, in which, however, it is falling astern. As a country which is pre-eminently adapted for the breeding of store cattle, Ireland has for some years enjoyed a measure of protection through the operation of the Diseases of Animals Act, which absolutely prohibits cattle, sheep, or pigs from outwith the United Kingdom being landed at our ports except for immediate slaughter. Just as Canada aspires to be the granary of the Mother Country, so Ireland aspires to be the great source of supply for Scotch and English "feeders." The latest Irish statistics, however, show that a great deal of land in Ireland which was formerly under arable cultivation is now being laid down to permanent pasture, to be used solely for stock-breeding purposes, and the Irish Department have for some time been harbouring a doubt as to whether this change, which undoubtedly makes for rural depopulation, is altogether for the good of "the most distressful country." The Irish Department, therefore, looked about for some means to counteract this policy of laying down land to permanent pasture, and they decided to try and make Ireland a second Jersey in the growing of early Potatoes and market garden produce.

Two years ago the Irish Department of Agriculture engaged Mr. Wallace, Terreglestown, Dumfries, who is undoubtedly one of the most enterprising and successful growers of early Potatoes in Scotland—and one of the best all-round farmers in Scotland—to go to Ireland and instruct the Irish farmers in the best methods of growing early Potatoes. Mr. Wallace executed that commission in a thoroughly efficient way, and his admirable lectures and illustrations on the subject—some of which were reproduced in our columns at the time—were such as to show anyone how to cater successfully for the early Potato market if he only had suitable soil and climate for carrying on that trade. Mr. Wallace also surveyed the land, and pointed out that some parts of Ireland, notably the fertile soil of Inchdorry Island and other parts round Clonakilty in County Cork, were most admirably suited for the growing of early Potatoes from boxed seed.

Last spring a number of landowners in that district, acting under the superintendence of an agricultural expert from the Agricultural Department, put Mr. Wallace's instructions into practice, and the results have been very gratifying to those who had the good fortune to be in the business. One of the growers, Mr. J. Crowley, had his Puritans harvested in the third week of June, and they yielded at the rate of five to six tons per acre. Mr. Crowley's entire crop had been bought beforehand by Liverpool buyers at £50 per acre, and as these Potatoes were in the market before the early Potatoes in the Girvan district were ready, the buyers must have done as well by them as the grower had done. Another grower, Mr. O'Leary, had his Potatoes sold at £12 per ton, so that if he raised a crop of six tons per acre he would do well with them too. The outstanding success which has attended the first attempt to put in practice Mr. Wallace's instructions as to the growing of early Potatoes in Ireland will undoubtedly have the effect of causing a greatly increased acreage in Ireland to be devoted to this crop next year, and as these early Potatoes from the Green Isle have the enormous advantage of being ready for the market before the stocks on the Ayrshire coast are ready, the Irish growers will have the best of the trade, and it may well be suspected that the early Potato crop in Ayrshire will not prove so profitable to the growers in the future as it has been in the past.—("North British Agriculturist.")

**Phaio-Calanthe × Sedeniana.**

This bigeneric hybrid obtained a first-class certificate in 1894 when staged by Baron Sir Henry Schröder. Messrs. J. Veitch and Sons, Ltd., were, however, the raisers of it, and the name of its hybridist is conveyed by this variety. The parents were *Phaius grandifolius* and *Calanthe Veitchi*. The flowers are creamy white, tinted pale rose, and are borne in tall spikes.

**Cypripedium leucorrhodum.**

Although an excellent likeness of this *Cypripedium*, the figure on p. 119 may mislead amateurs unacquainted with the charming set of hybrids to which it belongs. The pose of the flower is very like that of the single flowered scape as seen in *Cypripedium* generally, whereas in *C. leucorrhodum*, as in *C. Sedeni*, its near relation, several flowers are produced on a spike. These are among the most useful and beautiful in the genus, almost always in flower, and of delicate and charming tints of colour. No one who grows Orchids, if ever so few, can afford to do without the *Schlumi* and *longifolium* section or the hybrids from it.—H. R. R.

**The Week's Cultural Notes.**

Where the Mexican section of *Laelias* are kept by themselves in a light and practically unshaded house or compartment, they will by now be getting well hardened, and in some at least the flower spikes will be showing. But in the case of plants growing in company with *Cattleyas* and other Orchids that require more shade, some attempt must be made to get them well up to the roof glass in quite an unshaded position. They must not be shifted direct from one extreme to the other, but given moderate shade at first, removing this by degrees until it can be dispensed with entirely.

Most of the plants will have been potted in the early months of the year, and will by now have taken a firm hold on the compost and baskets or rafts in which they are grown. Consequently, they will be taking water very freely, and the free ventilation will dry them up rapidly. This is the kind of treatment they delight in, being quite soaked out with moisture one day, the next quite dry, and plants so treated will always be far healthier than others moving along in a compost never really dry. Free rooting can always be insured by these means, as the roots are put forth to look for moisture not caused by it.

It may be well just now to draw attention to the fact that it is almost impossible to overwater pseudo-bulbous Orchids when the bulbs are finishing. In spring it is different; the bulbs are storehouses of nutriment, and this is given off to the young growing shoots at a time when they are tender, so that overwatering then is dangerous as well as unnecessary. But now the bulbs are storing this nutriment while roots and leaves are solid and strong, not at all likely to be damaged by an overdose. The course then is quite plain, and it is almost impossible to err on the side of abundance with deciduous kinds as long as the leaves are fresh and the weather fine.

*Catasetums*, *Cycnoches*, *Dendrobiums*, *Chysis*, *Anguloas*, and all such sorts must be fed in late summer if they are to produce strong, healthy breaks in spring. When *Dendrobium chrysanthum* has practically finished growing, and there are no signs of the flower nodes swelling, too great light and air must be avoided, as it is apt to dry the stems and imprison the flower buds, but as soon as these are well away the ripening may proceed, the somewhat drier conditions serving to keep the plants from growing unseasonably.—H. R. R.

## Carnations at Keevil Manor.

For many years Keevil Manor, near Trowbridge, has had a local fame for its Carnations, Sir John Wallington being a keen enthusiast and a true lover of the florist flower. Keevil Manor dates from the fifteenth century, and is a fine and well preserved example of that early period. In the garden are clipped Yews, designated the twelve Apostles, and which afford the place quite an historic bearing. How many years these trees have been planted is beyond the capacity of existing memory.

Though the garden has so long produced its annual crops, there is still a wonderful freedom in almost everything planted, whether it be fruit, vegetable, or flower; and Carnations certainly grow and flower with wonderful perfection, given normal seasons. They are usually planted in beds, and in flowering time are protected with sunshades stretched over a framework

fixed for the purpose. This year a circumstantial misfortune which overtook the stock in winter so reduced them that a large portion of the plants remaining were confined to pots, and at flowering time accommodated in the greenhouse.

An invitation is extended to anyone interested by Sir John Wallington to inspect them when in bloom. An investment in the newest introductions is made each year, older ones and those of lesser merit being discarded from time to time. Only the very best will satisfy this veteran grower, and his standard is a very rigid one. A bed of seedlings grown from the best procurable strain that is offered failed to produce one worthy of a commendable note from him, because they fell short in some degree of the florist's standard.

At the time of my visit many of the flowers had been cut and others passed their best; but a few remained, sufficient, at any rate, to prove that the reputation of Keevil Manor, so long maintained, is based on quality of the highest class, and is varied from year to year by newer introductions. A few of those noted include *Amphion*, a magnificent flower of the *Fancy* or *Picotee* section, having a yellow ground with a bright rosy edge and markings; *Lady Audrey*, *Sir Beys*, a fine crimson self; *Gaston de Foix*, *Chas Martel*, a *Fancy* with creamy ground, striped and margined with scarlet; *Bannar*, a good scarlet self; *Nox*, the darkest of the maroons; *Seymour*

**Phaio-Calanthe × Sedeniana.**

*Cochran*, *Jocelyn*, *Barras*, bright scarlet; *Bendigo*, the nearest approach to a blue *Carnation*; *Countess of Verulam*, *Bertie*, a very pretty *Picotee*; *Almoner*, a fine yellow. *Helmsman* and *Henry Faulkner* are two good hardy varieties, and *Cecilia*, the finest of the yellow selfs, have been grown outdoors to 4½ in diameter, the colour clear, and the pods non-bursting.

These are only a tithe of the number of varieties grown, but many more will be added for another season's display. Though Sir John Wallington has passed the allotted span of life, and has some time since celebrated his golden wedding, he is still as enthusiastic and active among his favourite flowers as some many years his junior. Seldom does he leave home without his favourite coat flower. The *Malmaison* does not appeal to his sympathies, but the hardy border *Carnation* he stands by as being the best of all.—W. S.

**Injurious Insects.**

Twelve insects will cost the United States £70,000,000 this year. The chinchbug will draw £20,000,000 of this amount, the grasshopper will take £18,000,000, and the Hessian fly will call for at least £10,000,000 more. Three worms that attack the cotton plant will assess the farmers for a total of £12,000,000, and the Potato bug will eat 2,000,000 worth of his favourite kind of garden products. Two million pounds worth is a moderate estimate of the injury that will be done by the Apple worm, and the caterpillar that makes Cabbages its speciality, will destroy £7,000,000 worth of crisp green heads.

### Feeding the Plants.

Now that the growing season of the autumn queen is with us, and in view of the great efforts that are being made for the autumn exhibitions, the work of the joint committee of the National Horticultural Society of France and of the French Chrysanthemum Society will be of value. It was endeavoured to ascertain by practical experiment what are the best artificial manures to employ. M. Georges Truffaut, who has rendered signal services by his investigation of plant foods, made the report.

Nine cultivators, scattered over as many districts of France, first all submitted for analysis samples of the soil they intended to use, no manure of any kind being added. Each of the nine growers experimented with a single variety. M<sup>me</sup>. Gustav Henry, a variety of moderate vigour, and with pure white flowers. M. Nouin had also M<sup>lle</sup>. Laurence Zede, a more vigorous variety.

The plants were all grown in three ways—first, three stems; second, six stems; third, without any disbudding. Twenty-four plants were grown in each of these three ways. Of the twenty-four observed by each cultivator in each of the three sections, four received no manure, and served as check plants; four received a complete manure; four a similar manure, but in double quantity; four a complete manure with no nitrogen; four a complete manure with no potash; four a similar manure from which the phosphoric acid was eliminated. The manures were mixed with the potting soil in April, and, from August onwards, they were given in the form of solution.

### The Complete Manure.

The "complete" manure was composed as follows: Fish guano, twenty-five per cent.; dried blood, sixteen per cent.; sulphate of potash, twenty-four per cent.; double superphosphate, thirty-five per cent.; the analysis of which gave four-fifths nitrogen, eleven-twelfths potash, fifteen-sixteenths phosphoric acid.

The soluble manure consisted of phosphate of potash, fifty-four per cent.; nitrate of soda, forty-six per cent.; or nitrogen, 6.9 per cent.; potash 11.04; phosphoric acid, 20.52.

The quantity used was at the rate of 900 grammes to 100 kilogrammes of soil. The solution was used in the proportion of two grammes to one litre of water. The plants under treatment were exhibited at Angers last November.

The principal object of these experiments was to show by growing in sterile soil (white sand), the influence of nitrogen, potash and phosphoric acid respectively. The object of the other experiments was: First, to show the influence of the complete manure in soils of varied character, but of known composition; second, to study the influence of climate or season on the action of the manures, and the cultivation of one and the same variety.

The most successful result at the end of the experiment, was obtained where a double dose of the manure was employed; then came the plants treated to a single dose of the complete manure; next in descending order, plants grown without potash, without nitrogen, and the worst of all (except the unmanured plants) were those plants which had no phosphoric acid.

### Phosphoric Acid is Essential.

Phosphoric acid is thus shown to be of great importance to Chrysanthemums, and necessary to the formation of good colour in the foliage. Plants deprived of this ingredient had yellow foliage and a weak habit. Without potash, the plants produced long, weak stems, broad, thick but flabby leaves, falling off from the least cause. The flower stems were large, hollow, but limp, the flowers large, but of bad shape.

When nitrogen is absent the plants are feeble, pale in colour, the leaves small and thick, the stems of small diameter, the flowers few in number, hollow in the centre, and of small size.

M. Truffaut, in summing up the results of this series of experiments, advises cultivators to prepare a good compost of two-thirds sandy loam mixed with leaf mould, and to submit the compost to a chemist for analysis. The chemist will then be able to ascertain if the requisite elements are in due proportion or not, and to advise accordingly.

### What Nitrogen May Do.

Nitrogenous manures, it is found, should only be applied in small proportions, as plants grown with an excess of nitrogenous manure are more subject to the attacks of rust. Nitrogen is most

conveniently applied by means of dried blood, horn shavings, or guano in the requisite proportions; potash is best applied in the form of sulphate; and bone phosphate yields the necessary phosphoric acid. Soluble manures are requisite in the case of plants cultivated in pots from the middle of August.

### Early Flowering Varieties.

I am sending you a few flowers of early Chrysanthemums picked from out-of-doors; not because they are wanted so early in the season, but merely to show that several of the newer kinds are vying with M<sup>me</sup>. Marie Massé, and its sports, as to which shall produce their flowers first.

I am not sending many of the older varieties, for, apart from the Massé family, M<sup>me</sup>. Casimir Perrier and a few pompons, there are not many in flower. This season we are growing as many sorts of earlies as I could possibly get together for trial; and there are over 250 sorts, numbering altogether over 40,000 plants on the ground at the bottom of Earlswood Common (all early flowering varieties).

### Bud-taking on Japs.

Our best Japs have migrated to the new premises at Merstham. So much wet is not favourable to the pot plants, and if we are to have a continuation of wet weather, I guess the sooner the buds are secured the better; in fact, during this week we have secured a good number, which, had the weather been dry and warm, we would have let them go away to a later bud.—W. WELLS, Earlswood.

The foregoing letter from Mr. Wells, together with a delightful armload of fresh and fragrant flowers, stirring again our love for the autumn queen, is his response to an invitation of ours for notes on this favourite flower. The season is young yet; but Chrysanthemum growers, like ardent rosarians, or devotees of any other flower, can always enjoy references to their favourites. If, therefore, any cultivator of this popular plant has matter of interest to communicate, we should be happy to be the medium for its conveyance.

The flowers sent by our correspondent comprise some of Goacher's new unnamed varieties for 1904, and such novelties of last spring as

CARRIE, coloured deepest yellow, the exact shade (and almost the make) of a Dandelion. The flowers when disbudded to twelve or twenty on a plant are 4in, but if left undisbudded they are about 3in, and the most prolific, good for pots or borders, market or otherwise, lifts well, keeps well, and is the admiration of all, never shows an eye, and will never die out. A.M. at the R.H.S.; 2ft.

NELLIE, yellow, similar colour to Phoebus, but the make of the flower is more like Elaine, 4½in in diameter, has stiff stems, and is a good one for disbudding; 2ft.

GERTIE, salmon pink shaded gold, one of the most fascinating colours; it is rather too large to be classed as a pompon, but the shape is perfect, and the habit everything that one can wish. It has received an A.M. at the R.H.S.; 1½ft.

KITTY, pure pink, flowers about the size of Blushing Bride, a beauty for cutting in sprays; 2ft.

There are the following: ROI DES BLANCHES, a graceful, firm flower of a pure, glistening white.

PARISIANA, with good sized flowers, almost white, with a sweet, creamy centre, an exquisite flower.

CHAMP DE NEIGE, a very floriferous, stout, broad-petalled white, though tinged pink in the bud.

GOACHER'S CRIMSON, that gem of new early flowering market Chrysanthemums, is here; and the purplish crimson of its petals, backed and tipped by a plating of old gold, together with the largeness and artistic grace of its blossoms, combine to make this a variety quite indispensable to all growers. As a pot subject, too, it is unsurpassed.

MADAME MARIE MASSE var. is represented by a sturdy shoot carrying eleven fine flowers, reminding one of the Jap., La Triomphante of past days.

Lastly, there are Madame Casimir Perrier (pink), and its sport, Mrs. A. Willis, almost canary yellow, streaked, and run with faint crimson. Both are dwarf, and exceedingly free.

### Crops in the Fens.

The cutting of Peas, which are extensively grown in South Lincolnshire, was commenced a week ago, and next Monday a start will be made with Oats; but Wheat will not be begun for another ten days. A journey recently through the great Corn and Potato growing district, of which Spalding is the centre, showed that cereal crops had been badly laid, and farmers stated that twice as much labour would be required to harvest them, owing to the damage done by the recent stormy weather. It is anticipated, however, that the improvement which has taken place in the Potato, Mangold, and other root crops will nearly compensate for the increased cost of harvesting the corn.

### Stocks for Roses.

I agree with a great deal that "W. R. R." says on page 148, especially as to rushing into print about Rose stocks. It was, when Rose showing first began, I well remember, irresistible, and even beguiles me now into offering an opinion. "W. R. R." does not mention standards. To my mind, these have never been fully appreciated, and in my thirty years of growing show Roses I found nothing like them. They are not back-breaking to bud; they are easy to get to root, and they give, I always found, almost unsurpassable maiden blooms. I remember a well known nurseryman, who in the seventies always showed from his maidens, always managing to sell off his whole stock; and then every autumn planting out his fresh hundreds of Briar stocks, every one with at least a foot deep of good manure beneath it.

I was myself exceptionally well placed for getting Briars. In my Surrey parish my farmers most graciously gave me the run of all their hedges in November, and my two or three days "briaring" used to supply me with the three or four hundred stocks I needed. I then always thought that for exhibition H.P.'s there was nothing like a good Briar stock; whilst half-standards always seemed to me to give the best Teas. If not wanted for exhibition, high standards certainly make the finest show, and here in Berkshire a well known Rose grower at Aldermaston has Teas of great magnificence upon standards of all heights.

As "W. R. R." remarks, it is most pathetic to see the poor plants so often buried before they are dead. In many gardens the soil rises higher and higher up the stem with each yearly manuring, until the marvel is that the plant flowers at all. One other standard advantage I must mention before dropping my pen: a standard Briar's suckers are honest, open, and unmistakable; not like those of the insidious Manetti and De la Grifferie, which I continually observe in gardens here with their half or three-quarters murdered foster children.—A. C., Reading, August 13.

### Evergreen Shrubs for Seaside Planting.

In his useful recommendation of shrubs suitable for this purpose (page 148) your veteran correspondent, Mr. G. Abbey, includes *Euonymus japonicus*. This reminds me that it is par excellence, the villa frontage hedge at that charming seagirt Sussex town of Worthing, so famous for emporium of Grape, Tomato, Cucumber, and Melon cultivation. There hedges of it from a yard to even six yards high strike the visitor with wonder and admiration, and in effect even surpassing the less lively greenery of the common Holly, which latter, however, it is needless to observe, affords the more protective element as a fence. Contributing also to the scenic effect is the variegated golden form of the *Euonymus japonicus*, which appears to luxuriate equally with its prototype there, though comparatively much less in adoption. Its introduction from Japan to England occurred nearly seventy years ago, while the original variety was introduced about thirty years previously.

Some of the older established plantings of the subject in question at Worthing, and when not closely pruned or allowed to grow unrestrained, eventually produce fruit more like the scarlet berries of the Butcher's Broom (*Ruscus aculeatus*) than those of the Holly, though not nearly in such profusion as the latter. Of course, my observations relate to the *Euonymus* where sheltered from the direct exposure to the sea; otherwise, if sheltered by a retaining wall or other suitable fence, both the green and golden varieties luxuriate in close proximity to the seashore, as exemplified at Worthing.

Apropos of the formation of a hedge of *Euonymus*, a novel design is that to be observed in a few instances at Worthing, with a foundation of a wattled Hazel wood fence, about 3ft high, and which serves as a protection and support to the *Euonymus* in its initial stage of growth. The shoots protrude through the interstices of the fence, which, in the course of a few years, is completely enveloped by the rapid growing plants. The fence had, in the meanwhile, presented a pleasing rustic appearance, and, in fact, much more so than one composed of open palings.

In conclusion, it has just occurred to me that there is another shrub worthy of notice, and not mentioned by Mr. Abbey, that is the common Tamarix (*Tamarix gallica*), an excellent seaside plant, extensively planted along the South Coast; but, strangely,

not so at Worthing, excepting somewhat sparsely as a hedge plant in front of inner villas, forming as it does by reason of its pale green elegant and slender *Cupressus macrocarpa* like growths, a very pleasing contrast to the other various kinds of hedge shrubs. It is also readily amenable to the pruning shears or knife. Slips or cuttings readily root in the moist sea sand.—W. G.

### The New Garden of the Royal Horticultural Society.

In view of the large number of letters I am receiving asking if Wisley Garden can be visited by Fellows, will you be so kind as to permit me to say that at present the property has not yet been handed over to the Society, and that none of our officers are there as yet. It is therefore impossible to open it to the Fellows at present. In fact, some few months will probably elapse before that can be done, but due notice will be given to all Fellows as soon as ever it is possible.—W. WILKS, Sec.

### Flowering of Hardy Bamboos.

It is seldom we have the opportunity of seeing in this country any of the hardy Bamboos flowering in the open air. This year, however, is an exception to the general rule; for here, and probably in other parts of the country, they have flowered and are producing seed freely, and eventually I hope to have seedling Bamboos raised from home grown seeds.

So far only one species has flowered here, that being *Arundinaria Simoni*, and it is remarkable that plants lifted and divided as recently as the last week in April have flowered and are maturing seed quite as freely as old and established plants. It was thought at one time that when the plants flowered they died; but that is far from being the case, as not only are fresh shoots springing from the underground rhizomes, but the fruiting branches are also producing new growths, and appear likely to survive for a considerable time the production of their fruits.

It would surely be interesting to know what reasons can be assigned for this sudden floriferousness on the part of plants that, though old and well established, have never been known to flower before. We must bear in mind that the climatic conditions which have prevailed in this country for the past two years have been favourable to the better growth and development of these giant Reeds, and in that fact we shall probably find the cause. It would be instructive and interesting to have the views of other Journal readers who possess collections of these noble and decorative plants.—S. POPPLEWELL, Stokko Gardens, Wilts.

[*Arundinaria Simoni* habitually flowers in Earl Ilchester's London garden.—Ed.]

### A Plea for the Mole.

A writer in a recent issue of "The Daily News" says that "farmers owning much pasture land do not speak highly of the mole." That is quite true; there is a venerable and obstinate prejudice to overcome; but facts are facts, and text-books and works of reference clearly prove that the mole is not a destructive animal.

M. Flourens states that the mole, if not exclusively, is essentially carnivorous, and probably the most voracious eater in the animal kingdom. He feeds on worms, snails, slugs, caterpillars, cockchafer grubs, and many other subterranean and surface creatures. Mr. R. A. Sterndale, F.Z.S., in his work on the "Mammalia of India," says that moles are not trapped in India, and that their destruction in this country is carried on in a spirit of ignorance. Macgillivray, an observant naturalist, regarded the mole as a useful animal. I think it was Frank Buckland who called attention to the fact that wherever moles have been the grass grows afterwards very luxuriously. Miss Ormerod and Sir Herbert Maxwell have also written to the same effect.

The Board of Agriculture publishes a leaflet on the habits and life history of the cockchafer, in which it is stated: "Moles and shrewmice feed upon cockchafers, and both of these animals should be protected."

Moles, instead of being farmer's foes, are really his friends; and we may yet see laws passed to save him from extermination at the hands of his senseless persecutors. "Certain it is that in the present depressed condition of agriculture" (to quote from an article in "The Nineteenth Century," by the Rev. Augustus Jessop) "it is difficult to estimate how much serious mischief is being done by the extermination of one of the farmer's best and most influential friends, the mole."—JOSEPH COLLINSON, 53, Chancery Lane, W.C.

### Figs under Glass.

**EARLY FORCED TREES IN POTS.**—The trees may be placed outdoors when the wood is ripe, but they must not be so treated if there is any doubt about this, keeping them under glass, with a free circulation of air. These are matters in which the cultivator will need to exercise judgment. In either case encourage surface roots by dressings of manure and rough loam in equal parts, adding a sixth of old mortar rubbish, and a sprinkling of dissolved bones. See that those placed outdoors do not root from the base of the pots. Cut off all roots that have passed into the plunging material, top-dress, after which give a good watering, and they will only need water afterwards sufficient to keep the foliage in health. Where trees have to be bought orders should now be placed. The trees should have stems about a foot high, and well formed heads, with the growth fairly thin, and the wood ripened to the points of the shoots. The best varieties for early forcing are St. John's, Early Violet, White Ischia, and Brown Turkey.

**EARLIEST PLANTED OUT TREES.**—In the earliest houses the trees will now be ripening their wood, and watering may be discontinued, air being given very liberally. If, however, the second crop is not yet ripened moderate moisture in the soil will be necessary, with a free circulation of warm air to insure a high quality of the fruit. When the fruit is off cut out the growths not required for bearing or furnishing the trees, and take prompt measures against insects.

**UNSATISFACTORY TREES.**—Where the trees grow rampantly and produce their crops of fruit root-pruning should be resorted to, confining the roots to a narrow border of 3ft. to 4ft. width. A trench taken out at this distance from the stem after the fruit is gathered will check the tendency to a late growth, assist with ripening of the wood, more particularly if the growths are thinly disposed, and the points of the shoots, instead of being closely tied in, are allowed to grow up to the glass. If the drainage be defective it will be necessary to lift the trees in the autumn as soon as the leaves commence falling, and replant in fresh soil. Place in 9in to 12in of drainage, roughest at the bottom and smallest at the top, and on this lay 3in thickness of old mortar rubbish, freed of old laths and other pieces of wood, smashed and sifted with a  $\frac{1}{2}$ in sieve, using that remaining in the sieve, the finer particles being used for mixing with the soil to the extent of one-sixth. A 3in drain must be provided below the drainage to carry off superfluous water. Turfy loam, inclined to be strong rather than light, forms a suitable compost, adding to it the one-sixth of old mortar rubbish before mentioned, and a bushel of ground coprolites to every cartload of loam. In replanting ram the compost, well incorporated, thoroughly about the roots, spreading them out evenly well up to the surface, and with soil between each layer, so as not to have all the leaves together. This will insure steady progressive growth, short-jointed, fruitful wood, a solidified compost duly supplied with nutritive elements securing, with judicious ventilation and management, solidified growth and large heavy fruit. Should the drainage be good it will only be necessary to detach the roots as advised, confine the roots to the narrow border, and remove some of the old soil from amongst the roots, supplying a top-dressing with the soil above stated.—GROWER.

### Fruit Supply—Crops and Prices.

Plums and Damsons alike have failed all over the country with depressing unanimity. Just now the fair fields of Kent are yielding a beggarly but welcome harvest of Rivers' Prolifics and Kent Ezars, both blue Plums, but varying very considerably in size, the last-named variety being the larger of the two. They are, however, only commanding the moderate price of from 6s. 6d. to 7s. per sieve of 24lbs, the demand being far from brisk on account of the price, which, compared with that of fruitful seasons is, of course, very high. There are Plums even dearer, baskets of big, luscious-looking, violet-tinted Plums from France realising from 10s. 6d. to 12s.

The budding Apples shared the fate of the Plums. Continental growers have been alive to the situation, and hence Italian Apples, with something of the high pink and olive complexion of the dark daughters of the country, are to be seen outshining, in appearance at least, the rather sour-looking, but much approved Keswick. The foreign supply is, however, not appreciable where big markets like Manchester are concerned, and so Apples, like all other fruit, are also dear, the price of

English fruit ranging from 18s. to 30s. per cwt. The Italian Apples are quoted at 5s. 6d. per basket of 22lbs. Italy is also supplementing the poor supply of Green Gages, and the wholesale dealers are asking about 8s. 6d. for baskets containing from 14lb to 16lb.

A few people may feel inclined to accept the Tomato as a substitute for fruit, and if so, they will be pleased to learn that this bright-hued vegetable is arriving in Manchester from Guernsey at the rate of about 4,000 baskets a day, and is being sold wholesale at the low price of from 3d. to 4d. per lb.

### Fruit Crop in Blairgowrie District.

A record despatch of fruit in Blairgowrie district was made recently, when about 360 tons, mostly Raspberries, were railed. The record for one week last year was fully 250 tons, and the previous year fully 200 tons. The large increase this year is due to the greatly extended acreage under fruit cultivation. Growers are now realising that the crop is to be much shorter than expected, and some have been endeavouring to buy from others in order to prevent difficulties in the event of their being unable to complete their contracts. From two-thirds to three-fourths of the total Raspberry crop has now been railed, and picking will continue for at least a fortnight yet. The highest price realised so far is £43 per ton, free on rail. At this time last year they were selling at from £20 to £23 per ton. Strawberries are finished, except a few late varieties, which are being sent off in small lots. They can now command from £33 to £35 per ton, against £24 to £25 last year.

### Fruit Crops in the Hexham District.

The season for the smaller bush fruits is rapidly drawing to a close, and has been one of the poorest for many years. Strawberries have been a fairly good yield, though the anticipations formed about a month ago have not been fully realised, this being doubtless owing to the want of warm, bright sunshine. Owing to the late frosts, Gooseberries, Raspberries, Black and Red Currants have been very disappointing in many instances, the yield being a very meagre one. In some gardens, where the Red Currant bushes were in sheltered places, the crop has been fully up to the average. In few years have Black Currants reached such a high price as this year, while another effect of the scarcity of fruit has been the enhanced demand for Rhubarb, which, along with such fruits as the Raspberry, makes excellent jam or jelly. Of the larger or tree fruits, Plums are almost an entire failure, and Apples and Pears are much below an average, though there are Apple trees of the later varieties well covered with fruit.

### Fruit Famine in Cambridgeshire.

The general scarcity of home-grown fruit this year amounts to almost a famine in the famous Green Gage and Plum growing districts of south-west Cambridgeshire. So complete was the destruction of the crops by the spring frost that in some orchards there are absolutely none, while in others two or three on a tree is all that can be seen. Only two years ago, of Green Gages alone the consignments from the villages of Meldreth and Melbourn from the little station on the G.N.R., which serves the two villages, amounted on two days to 30 tons each, and one week's return was 140 tons of Gages from this small station. For the occupiers of small homesteads with orchards attached, of whom there are quite a number in the villages hereabouts, it is a serious loss indeed. In a fruitful year an orchard will pay nearly the whole year's rent of a homestead. But this year it will mean £100 rental for a house worth in itself £20, and no produce from the orchard. As a rule, orchard land which is fairly planted, will make about £10 an acre rent, which is a very good thing for the landlord, and also for the tenant in a good or even average year. The more enterprising growers who have land available for adding to their planting, adopt the expedient of planting Gooseberries or small fruit beneath the young Plum or Apple trees, and for a few years this is a source of profit. This year, owing to the famine in stone fruit, Gooseberries have made an exceptionally good price, and have made a half crop of this fruit worth about as much as a full crop of an ordinary season. But these growers may be counted on the fingers' ends, and in all the older homesteads there is no compensation whatever for a disastrous season. Apples and Pears are almost as bad as Plums. In one case in a village adjoining the centre of the Green Gage orchards referred to, a well-known grower of Apples estimates that in an orchard from which in a good year he gathers 2,000 bushels of Apples, he will this year only have about 10 bushels, or one Apple this year for every 200 in a good year. For the growers of stone fruit there is consolation in the fact that the fruitless trees are in a fine thriving condition, and are making rapid growth, and give promise of being in a good bearing condition for another year. Apples are, however, the exception to the rule, and do not look at all healthy. Fortunately for the manufacturers of jam, there has been a plentiful crop of Strawberries and a fair crop of Raspberries, and the consumer of fruit is not likely to suffer so much

from the bad season as the growers in particular districts where the cultivation is largely of one kind of fruit.—("East Anglian Daily Times.")

## Book Notice.

### The Wild Garden.\*

Mr. Robinson observes that the term wild garden is somewhat misunderstood; and what it means is the use of hardy plants from abroad, naturalised and allowed to grow according to their nature without "culture," on banks, in woods, by streamlets, or in copses, which each form features of English estates. As the author advocates in print, so does he practise; and the charm of his own

the finest hardy flowers thrive much better in rough uncultivated places than they do in borders where the soil is forked and hoed. Secondly, they are seen to better effect amongst grass or in natural pieces of ground. Thirdly, their decay and passing away produces no disagreeable effects; and fourthly, the question of spring gardening is solved, and by naturalising, the minimum of labour is required. Indeed, mowing, except for shaven carpets of grass here and there, is a costly mistake. The question is asked, "Who would not rather see the waving grass with countless flowers than a close surface without a blossom?" Yet there are places where they boast of mowing forty acres!

While devoting his pages almost exclusively to hardy exotics, the author advises, as a matter of course, that the best British plants be secured and naturalised wherever these are wanting on an estate. In his own case he has introduced many subjects:

*Clematis* × *Countess of Onslow*. (See page 170.)

splendid garden in Sussex is due in a great measure to the naturalising of plants amongst the grass in all directions, plants like the Everlasting Pea, the Mulleins, the Montbretias, Heathers, Asters, Clematises, Rock Roses, Sumachs, Ceanothuses, and a host of beautifully effective subjects to which culture, as given to border plants, is unknown; and which thrive as grandly, or better, than they do in their own native homes. And what a charm they have in their abandon! Masses of Montbretias and Day Lilies covering a grassy bank like soldiers swarming on a hill, their own bright flowers but vying with the beauty of others around them. "The Wild Garden," therefore, is written to tell what can be used, how so, and to furnish examples in text and illustration.

The reasons in favour of wild gardening are that hundreds of

white Heather, water Forget-me-not, also the wood variety; Typhas and many other plants.

In dealing with the innumerable subjects suitable for wild gardening, he has found it best to classify all plants of the Globe-flower order (Ranunculaceae), the Forget-me-not family (Boraginaceae), Umbellifers, Composites, &c. Hardy exotic plants of other orders are treated in a chapter apart, each genus having its own merits discussed. In the matter of fences and boundaries there are pages of interesting records; while the qualities of British wild flowers and trees are emphasised and their employment urged. Plants for dry places for walls and ruins; and plants for bogs, streams, lakes, and meadows, copses, and uplands, are tabulated and written of in due order, the love for them, and experience of the author, contributing to lead one on in his interesting chapters, and thereby learn. The small engravings go a long way towards helping out the author's meaning and suggestions.

\* "The Wild Garden," by Wm. Robinson. Illustrated by Arthur Parsons. Fifth edition. John Murray, London. Price 10s. 6d.

# NOTES & NOTICES

## Clematis × Countess of Onslow.

This pretty Clematis is the result of a cross between *C. coccinea*, and the variety Star of India, and was raised by Messrs. Jackman and Son, of Woking, who received a first-class certificate for it. Our engraving shows the form; and their colour is a rich reddish-purple, with bands of deep scarlet. The foliage resembles that of *C. coccinea*. It is quite hardy, a good grower, and of a climbing habit.

## Home Counties Nature-Study Exhibition.

We are informed that the Home Counties Nature-Study Exhibition will be held, by kind permission, at the offices of the Civil Service Commission (formerly the buildings of the University of London), Burlington Gardens, London, W., from October 30 to November 3. Prospectuses, regulations, and prize lists may be obtained from Wilfred Mark Webb, Hon. Sec., 20, Hanover Square, N.

## The Carnation League of America.

The Carnation League of America was formed to commemorate, annually, the life and works of William McKinley, and foster national patriotism. The same loyal impulse that prompted the stopping of almost all the wheels of industry for those few moments on the day of his burial has found annual expression in this simple tribute instituted by the Carnation League of America. That the Carnation was President McKinley's favourite flower, and was always found in his button-hole, is the reason for its choice as a league symbol, to be worn on each recurring 20th day of January, the anniversary of the late President's birth. The custom was first observed on January 29, 1903, with the greatest unanimity all over the country, and by Americans all over the world.—("American Gardening.")

## Legal Notes—West Wycombe Horticultural Society.

His Honour Judge Warren, in Wycombe County Court, decided to whom belonged a balance of £180 in the hands of the treasurer of the West Wycombe Horticultural Society, which ceased operations two years ago rather than comply with the wishes of Sir Robert J. Dashwood, Lord of the Manor, who refused the use of his park for the annual flower show unless the beer tent was abolished. Mr. Thomas Martin, one of the members of the old society, sued Mr. S. Norman, the treasurer, by advice of counsel. Both plaintiff and defendant had engaged solicitors, who argued the case at considerable length. Since the old society ceased operations, a new society has been formed conforming to Sir Robert Dashwood's wishes. His Honour, having heard the arguments, decided that the sum in question should be equally divided among all who were either honorary or ordinary members of the old society at the date of the passing of the resolution winding it up.

## School Gardens.

A Bill was issued a week ago which has been introduced by Mr. Jesse Collings, the object of which is to provide for the teaching in all public elementary schools of agricultural and horticultural subjects; to give facilities for nature study, and generally, by means of object lessons, to cultivate habits of observation and inquiry on the part of the pupils. To this end the Bill provides for school gardens, and such collection of examples and objects as may be necessary for the practical illustration and application of the instruction given. The education specified in the Bill, while optional in urban schools, is compulsory in all schools situate in rural and semi-rural districts. The measure includes instruction in fruit, flower, and vegetable growing; poultry and bee-keeping; budding, pruning, and grafting; cow and pig-keeping; milking; rotation of garden crops; nature and properties of soils; use of manures; knowledge and choice of seeds; structure, life, and food of plants; action of birds and insects on crops; choice and use of simple tools; and packing fruit, vegetables, and other produce for market.

## Sundriesmen's Tent at Chiswick.

The Secretary of the Royal Horticultural Society requests us to state that the Council have consented to have a sundries tent at Chiswick on September 29 and 30 and October 1, in precisely the same way as they did at the last Holland House Show. Application for space should be made to Mr. Wright, R.H.S. Gardens, Chiswick, W.

## Hop Growers.

A party of between twenty and thirty German Hop-growers at present on a visit to England reached Canterbury a week ago, and were welcomed by the Mayor (Sir G. Collard). The party returned with a number of English growers, who recently toured through the Alsatian and Bavarian Hop gardens. The visitors have inspected the Faversham neighbourhood and that of Rye, in Sussex.

## Bulb Growing in Lincolnshire.

A correspondent informs us that Mr. T. Kime, of Mareham-le-Fen, Boston, Lincolnshire, is still very busy taking up his Tulips. He has now under cultivation nearly three acres, comprising a stock of about 600,000 bulbs of 130 different kinds. We have received samples of his single Tulips, White Swan and Couleur Cardinal, and we must say that never have we seen finer or better grown healthier bulbs. The Dutchman may beat us in growing Hyacinths, but he certainly cannot do better than we can in growing Tulips and Daffodils. Mr. Kime will this year take up 3,000,000 (three millions) of Daffodils or Narcissi, a good many of which are going to Holland.

## Holloway's Protected.

In the recent action, *Holloway v. Clent*, Mr. Justice Swinfen Eady, in the Chancery Division, made perpetual an interim injunction recently granted by him restraining the defendant from using the name "Holloway" in connection with pills and ointment sold by him. At the first hearing of the case his lordship, in granting the injunction, remarked that on the facts alleged by the plaintiff, it appeared to be a case of "gross fraud." At the final hearing on July 29, his lordship was satisfied of the justice of the plaintiff's case, and therefore granted a perpetual injunction, with costs. Mr. Israel Davis appeared for the plaintiff; Mr. Jessel for the defendant. The successful party in this suit is, of course, Thomas Holloway, proprietor of the well-known Holloway's pills and ointment.

## Giant Colonial Oranges.

The Orange supplies, which are particularly varied and abundant for the time of year, have had some welcome additions in the way of prime samples from South Australia and Jamaica. The mammoth Washington Navels have created quite a stir in the trade, for the fruit is so large that some of the cases only contain seventy-two fruits, and they sold at 18s. a package, or 3s. a dozen wholesale. This is a phenomenal price. Other varieties, with ninety-six, 120, and 150 to the case, sold at 14s. Without doubt these South Australian Navels are the finest Oranges ever put on Covent Garden Market. The Jamaican arrivals are good, but in no way comparable to the Australian fruit. With 150 and 200 to the case they sold from 10s. to 16s. each. These values are equal to those prevailing for choice Jaffa Oranges which are now on sale, and are satisfactory.—("Westminster Gazette.")

## Doctoring Trees.

A new method of feeding trees and plants without the agency of the roots has been discovered by the well-known entomologist, M. S. A. Mokrshezki, who has explained his discovery in a lecture before the Imperial Botanical Society of India. He has invented an apparatus by which he can introduce into the stems of Apple and Pear trees salts of iron, either in the form of a solid or in solution. The effect of the chemicals is, on the one hand, completely to cure the tree of chlorose, and, on the other, to stimulate its growth in an important degree. Among other extensive researches the scientist has applied his theory to 800 fruit trees growing on the southern shore of the Crimea. By introducing dry sulphate of copper into the stems he produced an unusual development of the trees, as many photographs testified. M. Mokrshezki considers that in this way the size of a fruit tree can be increased, its colour improved and varied, and its diseases removed. The discovery opens up a wide field of practical utility, and is regarded as most important.

**Abnormal Prices.**

The subjoined table shows the high price of some of the fruit in season—mostly foreign—as compared with last year:—

	This Year.	Last Year.
Good Plums .. ..	8l. to 1s. per lb.	3d. to 8d.
Grapes .. ..	1s. to 1s. 9d.	6d. to 9d. per lb.
Ripe Pears .. ..	8d. to 1s. 3d. per lb.	5d. to 10d.
Bananas .. ..	1s. to 1s. 6d. doz.	1s. for 2 doz.
Apples .. ..	8d. to 10d. per lb.	3d. to 8d.

**Failure of English Fruit.**

There is no English fruit but such as has been grown under glass. Frost in May and rain during June have played havoc with the crops. Green Gages, which normally sell at five, six, or seven shillings a half bushel, are now bringing anything from ten to sixteen shillings. Red Gooseberries, which usually sell at two shillings a half bushel, can now fetch five or six shillings. English Black Currants are at a fabulous price. What there is of them in the market is going for fourteen shillings a half bushel, against an average price of six shillings; while Red Currants, which are very scarce, are worth six or seven shillings the half bushel, as against a normal three. As for good English Apples, some are now selling for four shillings a half bushel, for which in ordinary times no one would pay more than 1s. 6d. or two shillings. In the last fifty years, remarks the "Hackney Spectator," it is said there has been only one year so bad as this. Foreign importations, principally from Germany and the States, will make up the deficiency.

**Scottish Fruit.**

For some years the finest Potatoes in the English markets have been of Scotch growth. Scotch Potato values are always higher than English ones. So with forced Grapes. The finest Gros Colman grown in the United Kingdom for market come from Scotch forcing houses, and for ten years and more they have been unrivalled for size, colour, and quality. The same may be said of Tomatoes. It is only in recent years that the soft fruit growing industry has attracted unusual attention in the trade. This year there has been a phenomenal boom in Scotch Raspberries and Strawberries, and English dealers scoured the fruit districts in larger numbers than ever to obtain supplies. Only recently the output from the Blairgowrie district alone exceeded 200 tons. The quality of these berries must be good, as they are bought up by individual buyers in fifty and 100 ton lots even. Values for Strawberries ranged from £20 to £26 a ton. Raspberries made from £30 to £40, and it is rumoured that as much as £43 a ton has lately been given for these fruits. The present has been a record season, and, as the result, operations are to be extended during the next three or four months. In addition the pulping and jam making industries are to be developed by the Blairgowrie growers.

**Foreign Fruit—Enormous Volume of Trade.**

As the result of the failure of British fruit, observes "The Globe," the foreign shipper this season has got the trade entirely in his own hands. Immense shipments are coming in from the Continent. The receipt of Plums, Pears, Currants, and Cherries has been enormous. Over 80,000 packages of French fruit alone were put upon our markets during the past week. More than 60,000 came from Germany. About 25,000 bushels of Apples reached us in the same period from America, Spain, and Russia. As to Bilberries, over 45,000 packages of them arrived from Germany and Holland, and in the Midlands they have quite displaced the popular Black Currant. In six days sixteen steamers brought 124,000 packages from Spain, made up of Tomatoes, Melons, and Grapes chiefly. In addition large parcels of Plums and Pears arrived from Belgium, Holland, and Germany. Among the 10,000 boxes of fruit sent from California to Covent Garden were large quantities of fresh Plums and Pears, the latter competing chiefly with the supplies from France. Up to the present time over 1,000,000 packages of produce, chiefly fruit, have been exported to England from the Island of Guernsey alone. As some of these growers made as much as 10s. a dozen for their forced Peaches, 5s. and 10s. each for their early Melons, and 2s. 6d. a pound for their forced Grapes, the profitable nature of these import industries is apparent. The foreign fruit-growers are having a record season, and week by week are taking more money out of the country than they have ever done before. The trade in foreign fruit is becoming immense.

**Fruit in Yorkshire**

The marketings of fruit are extremely limited this season locally, the failure of orchard growths falling with peculiar hardship upon many cottage occupiers in the villages of the Riding, who have been wont to realise their rents and a trifle over from their summer and autumn sales. Bush fruit is scarce, and very far below an average crop; hence its dearth, and the prices of imported stone fruit are correspondingly high, and are likely to continue so, lacking home competition in the form of Plums and Apples. This will tell upon the poor, who will thus be unable to introduce fruit as largely as they have done in years of plenty into their daily dietary. The Plum growers of Worcestershire and places nearer London have no fruit to send, owing to the sharp frosts of the spring, and also to the strong winds, which destroyed all the blossom. These statements, says "The Eastern Morning News," are applicable to Yorkshire, and there are orchards in this Riding which have not a bushel of fruit in them.

**Formaldehyde as a Fruit Preservative.**

A Press despatch this week from Pasadena, Cal., says that fumigation of Citrus fruits with a preparation of formaldehyde, which was recently undertaken by Manager T. J. Ashby, of the Pasadena Lemon Growers' Association, has met with gratifying success. Eastern advices regarding the first shipment of fruit upon which the preparation was used state that nearly every box of fruit was in a splendid state of preservation when destination was reached, there being only five per cent. decay. There were also thirty-six boxes of Lemons in the same shipment upon which formaldehyde had not been used, and they showed a decay of twenty-five per cent. The success of these experiments has been so pronounced that they have attracted the attention of fruit men all over the country. The Agricultural Department of the United States Government has also become interested in them, and has written to Manager Ashby asking him to furnish the Government with full information concerning the methods pursued and the exact gain over the other means in general use to attain the same end.—("Fruitman's Guide.")

**Isle of Wight Horticultural Association.**

A Sweet Pea show was held under the auspices of the above association at the Drill Hall, Newport, on July 31. Unfortunately the elements possessed such a potential influence in aiding success or failure, that for a week previously they warred against us. Five hundred vases of Sweet Peas had been promised us by intended exhibitors, but we had perforce to content ourselves with less than 200 staged, all of which bore evidence of violent storms and tempests. The twelve vases less injured were sent in by D. and G. E. Drabble, Esqs., Los Altos, Sandown (gardener, Mr. Niblett). The Rev. Knight Smith exhibited vases of the new pink variety, Countess Spence. Messrs. Peed and Sons, of West Norwood, staged fifty good named varieties, and those staged by R. Roach Pittis, Esq., and Dr. Shaw, were fairly good. In the amateurs' class Messrs. Miller and Watson were most creditable.

Chief amongst miscellaneous subjects were three dozen really superbly grown and flowered Gloxinias, exhibited by Dr. Shaw (Asylum Gardens). There was staged by Mr. M. Prichard a beautiful and extensive collection of hardy perennials and alpine plants, many of them new and rare, from his nurseries at Christchurch, Hants; also grand Gladioli Madame Hulbot, deep purple shade, worthy extensive cultivation, these having long had a big reputation for this class of plant. Mr. E. Cave staged a clean, healthy lot of stove and greenhouse plants. The above three exhibits formed perhaps the most prominent features of the show. Messrs. D. and G. E. Drabble sent in good Muscat Grapes and collection of cut flowers, including a fine lot of types of Gloxinias; Dr. Shaw, cooking Apples; Col. Pearson Crozier, superb stands of Carnations and Picotees; Mr. W. Tee, Newport, staged beautiful stands of the former. Ferns were admirably shown by R. Roach Pittis, Esq.; flowering and foliage plants by Mr. Parsons; and Begonias by Mr. Dyer. The judging was in the capable hands of the Rev. Knight Smith, Meonstoke, Hants, and Mr. E. C. Goble, Ryde Nurseries. The rev. gentleman subsequently read a most instructive paper on Sweet Peas and their culture. The secretarial work was carried out by Messrs. Triblick and Kime.

## Shrewsbury Floral Fête.

Those who won any of the leading prizes this year at this renowned annual fête, thoroughly deserve what praise and credit these can bring; for a less encouraging year is not within our immediate ken. Yet with modern skill and appliances, cultivators are able year after year to send of the best in all departments, and send it liberally.

The show, from general observation, seemed well up to the high standard of previous years, and there was a great freshness about the floral displays, which were extensive. All sides of garden produce are of the choicest at Shrewsbury, and the exhibition must be of great educational value to gardeners from all parts of the country, though somewhat bewildering to the uninitiated.

Thanks to the forethought and the vigilance of the committee and the hon secretaries, Messrs. Adnitt and Naunton, the items of the exhibits were duly in order, and caused to be named for everybody's benefit.

Fruit, especially Grapes, was good, the great class for the latter exciting the keenest interest from all parties. Mr. Goodacre led, and Messrs. Buchanan came second.

Specimen plants were very handsome; Sweet Peas had a whole tent; Roses and Dahlias were in fair quantities. What our reporter of the floral artistic designs has to say of them may be taken as authoritative, he being a noted florist.

Vegetables were good all through, and the noted exhibitors of collections were again testing their respective abilities as cultivators and stagers of produce.

In concluding these introductory remarks, we would point out that this report has to be very hurriedly secured; therefore, if any exhibit is omitted, we trust that such error of omission will be condoned as purely the result of exceptional circumstances. The weather was of the finest, with sunshine and breezes, on Wednesday, and large numbers of visitors were early into the grounds. Many were from London, and some from Edinburgh.

### Plants and Groups.

The specimen plants at this show are always one of the leading features, and on this occasion they were fully up to the average. The premier class for fifteen stove and greenhouse plants, not less than ten in bloom, brought out three competitors, forming a huge show in themselves. Messrs. Cypher and Sons, Cheltenham, proved the victors, with *Kentia Belmoreana*, *Bougainvillea Cypheri*, a superb plant of *Statice intermedia*, *Ixora Duffi*, *Erica Marnockiana*, *Stephanotis floribunda*, *Croton Warreni*, *Croton Sunset*, a grand plant of *Phoenix rupicola*, *Statice profusa*, *Allamanda grandiflora*, and *Bougainvillea Sanderiana*; a superb collection right through.

Mr. W. Vause, Leamington, was second, with rather weaker plants, the Crotons lacking in colour. His best plants were *Ixora Fraseri*, *Bougainvillea Sanderiana*, *Croton Queen Victoria*, and *Clerodendron Balfouri*. Mr. W. Finch, Coventry, was third. Throughout the show artistic taste seems to prevail, except in this class, where most of the huge specimens were staged on a scaffolding of beer-barrels, some having no less than five to support them, with rough deal quartering, and various other primitive props, and this, too, with art muslin at a penny per yard. Wake up, Shrewsbury!

For six stove and greenhouse plants in bloom or foliage there were four competitors. The first prize was well won by Mr. B. Cromwell, gardener to T. Sutton Timmis, Esq., Allerton, who staged a grand plant of *Ixora Duffi*, covered with flowers and in perfect health, *Statice profusa*, *Stephanotis floribunda*, *Lapageria rosea* (grand), *Ixora Williamsi*, and *Kentia Fosteriana*. Messrs. Cypher and Sons followed with fine *Statice profusa* and *intermedia*, splendidly flowered, and *Ixora Pilgrimi*; while Mr. W. Vause brought up the rear with weaker plants.

The groups were simply splendid, and in the allotted space of 300 square feet the exhibitors could do themselves justice. There were three exhibitors, and all worth a first prize. However, Mr. W. Finch was placed first by the judges, with a series of mounds with dot plants of *Cocos Weddelliana*, *Humea elegans*, Bamboos, and other foliage plants. The flowering plants were chiefly *Liliums*, *Paneratiums*, *Ixoras*, *Orchids* in variety, and *Begonia Gloire de Lorraine*. The arrangement was light and effective. Messrs. Cypher and Sons followed closely; in fact, most people disagreed with the judges. Their arrangement was similar to the former, except that more *Orchids* were used. The front of the group was a blaze of colour, artistically blended and grouped. The *Ixoras*, too, were used tastefully, as were all the foliage plants. Mr. W. Vause came third with a pretty group, though less telling than its compeers.

A group of ornamental foliage plants for effect in a similar space was well represented, there being four entries, and a brave show they made, too, Messrs. Cypher and Sons winning with a handsome arrangement. The Crotons, *Aralias*, and Ferns were perfect in colouring, while the groundwork was well arranged.

Mr. J. Thompson, Derby, made a good second, his Crotons were well coloured and nicely displayed, though the general effect was not so good. Mr. J. Read, gardener to the Earl of Carnarvon, Burton on Trent, made a good third.

For thirty stove and greenhouse plants in pots, not exceeding 10in in diameter, and not less than twelve in flower, there were three competitors, a very strong class, and difficult to judge. Mr. J. Lambert, gardener to Lord Harlech, Oswestry, was awarded first position. A few of his best plants were *Ixora Pilgrimi*, *Ixora Duffi*, *Clerodendron Balfouri*, *Dracæna Shepherdii*, *D. Baptisti*, *D. Godseffiana*, and Crotons were all good. Mr. B. Cromwell was a capital second, having *Ixora Duffi*, *I. coccinea superba*, *Gloriosa superba*, and a few good Crotons. Messrs. Cypher were third with neat plants.

There was a capital competition for a single specimen stove or greenhouse plant in flower, no less than five staging. Mr. W. Vause led with a good specimen of *Erica æmula*. Mr. W. Finch followed with a superb plant of *Ixora Westi*, while Messrs. Cypher brought up the rear with a *Stephanotis*.

For four exotic Ferns there were five entries, but the competition was not very keen. Mr. B. Cromwell won first with plenty in hand. His plants were *Davallia fijiensis* (a grand specimen), *Nephrolepis rufescens*, *Microlepia hirta cristata* (a monster in good condition), and *Adiantum cuneatum*. Mr. Stevenson, gardener to Mrs. J. H. Slaney, Sunnycroft, Wellington, followed with weaker plants, and Mr. J. Carter, gardener to W. J. Scott, Esq., Bedford House, third.

For six *Dracænas* there were three entries, Mr. T. Lambert taking first place with good plants of *D. amabilis*, *D. Lord Wolseley*, and *D. Baptisti*. Mr. R. Lawley being third.

Tuberous *Begonias*, six plants, were good, though somewhat uneven, Messrs. Blackmore and Langdon gaining an easy first prize with large, handsome plants. Messrs. B. R. Davis and Sons made a good second. The third prize was not awarded.

For twelve *Gloxinias* Mr. R. Lawley, gardener to Mrs. R. Darby, Adcote Hall, was awarded first prize with good plants, Mr. A. Jones being second with good fresh stuff, and Mr. J. Carter third.

There were three groups of tuberous *Begonias* staged, and superb they were too. Mr. F. Davis, Woolashill, near Pershore, led off with a splendid exhibit, the blooms were perfect in colour and freshness. Messrs. Blackmore and Langdon were second with an equally creditable display, while Messrs. B. R. Davis and Son, Yeovil, were third, making the competition very warm.

There were again three entries for twelve table plants, Mr. B. Cromwell being to the fore with well coloured Crotons and Cocos. Mr. A. H. Hall, gardener to J. C. Waterhouse, Esq., Macclesfield, second, and Mr. Alex. Home third, with a remarkable collection.

The thirty miscellaneous plants made a good show. Mr. T. Lambert was first with some pretty *Ixoras* and Crotons; Mr. B. Cromwell came second with a bright display, and Mr. J. Carter third.

In the class for a group of plants arranged for effect in a space of one hundred square feet, confined to the county of Salop, Mr. W. Phillips, gardener to T. F. Kynnersley, Esq., Leighton Hall, won well with a light and graceful group, the Palms and Crotons being most effective. Mr. W. Roberts, gardener to Mrs. Swann, Halston Hall, was a first rate second, though rather heavier in build. Mr. S. Bremmell, gardener to H. H. F. Hayhurst, Esq., Wellington came third.

The stove and greenhouse plants were represented in this section by six plants, Mr. T. Lambert winning with nice plants of *Clerodendron fallax*, *Statice profusa*, *Kentia Fosteriana*, *Croton Evansiana*, and *Ixora Pilgrimi*. Mr. Jones followed, and Mr. W. Roberts made a good third. The next class was similar to the last, except that four plants must be in flower; here Mr. J. Carter was easily first prizewinner. Mr. W. Ashwood was a weaker second, and Mr. E. Cliff third.

### Floral Decorations.

These were a wonderfully attractive feature. The exhibits were very numerous, and on the whole most beautiful, the display of bouquets being probably the finest ever exhibited at any show, and displaying a prodigality of beauty which many bouquetists might envy, but few possess. Messrs. Perkins and Son and Messrs. Jenkinson were both in great form, and largely divided the chief honours. For bride's bouquet, Messrs. Jenkinson were awarded first prize with largely *Odontoglossum Alexandræ*, a massive, beautiful bouquet, but a bit heavy. Messrs. Perkins and Son were placed second with a most elegant bouquet, chiefly *Alexandræ* with *Paneratiums*, *Masdevallias*, *Lily*, &c., a marvel of beauty, and would certainly have been first if the judging had been left to public taste. For bridesmaid's bouquet, Messrs. Jenkinson were again first with a large, handsome bouquet of purple *Dendrobies*, *Alexandræ*, *Oncidiums*, &c.

Here Messrs. Perkins were again unaccountably second with a most charming arrangement of similar flowers, in elegance, finish, and workmanship. They were clearly ahead. Third

went to Messrs Jones and Sons, Shrewsbury. For ball bouquet there were six competitors, the first prize in this case going deservedly to Messrs. Perkins; second to Messrs. Jenkinson and Sons, and third to Mr. Treseder, Cardiff; fourth specially awarded to Messrs. Pope and Sons, Birmingham. For ball and bridal bouquets, Messrs. Perkins got first award with very handsome arrangements in Carnations—one pure white and the other shades of pink; second, Messrs. Jenkinson and Sons.

For shower bouquets of Cactus Dahlias Pope and Sons led with a very handsome arrangement in pink and primrose shades; second, Mr. Treseder, Cardiff. For feather weight bouquet, Messrs. Perkins were first with a most elegant arrangement of Odontoglossums, Masdevallias, and Oncidiums; second, Messrs. Jones and Sons; third, Messrs. Jenkinson and Sons.

The display of designs was not large, and, except in one or two cases, not specially attractive. For Harp, Messrs. Jenkinson and Sons, and Messrs. Perkins and Sons were first and second respectively. For Cross, Messrs. Perkins were first with a very beautifully executed arrangement with groundwork of white Asters, lightly sprayed with Alexandras, Cattleyas, and elegant green; second, Messrs. Jones and Sons. Messrs. Pope missed second place by allowing their greenery to exceed size. For Wreath, O. Robinson, Esq., Adderley Lodge, Cheshire, got first award with a large many-coloured, rather rough arrangement. Mr. Treseder was second. For any other design, Messrs. Pope and Sons were first with a handsome, but rather heavy, anchor; second, Messrs. Jones and Sons.

There was a large display of baskets, which made a very attractive exhibit. For basket for drawing-room Messrs. Jones were first with a very large, handsome arrangement; Messrs. Pope and Sons, second. For baskets for hand (Orchids excluded) Messrs. Perkins were first with a very handsome arrangement of Carnations and Lily; second, Mr. Treseder, Cardiff. For stand of cut flowers, excluding Orchids, Mr. Robinson was deservedly first with *Pancratiums*, *Begonias*, *Gloriosa superba*, &c.; second, Messrs. Jones and Sons; and third, Messrs. Jenkinson. For buttonholes and ladies' sprays, Messrs. Perkins were first with a beautiful arrangements in Orchids; second, Mr. Treseder.

In classes from 41 to 45 the prizes offered were for table decorations, open to ladies and amateurs, who made a very first-rate show. For epergne and two baskets, Miss Mary Morgan gained first award with a fairly good arrangement of Sweet Peas and Carnations, with Grasses and *Gypsophila*; second, Mr. J. Cook, Shrewsbury. In class 42, for an arrangement of cut flowers to occupy four feet space, Miss M. Morgan was again first; second, Miss Mary Allen, with Tea Roses and Carnations. In class 43, for arrangement of cut Roses, to occupy four feet, Miss Evans, Bilton, was first with a slightly heavy arrangement; second, Miss Bates, Wem.

For dinner-table arrangement of Sweet Peas there were no fewer than eleven competitors, all ladies, and the display was very charming. First prize was awarded to Miss Lashmore, Market Drayton, with a very light arrangement of pale pink Peas with Grasses and *Gypsophila* and sprays of *Ampelopsis*; second, Miss Morgan, with pink and mauve; third, Mrs. G. E. Colin, Ludlow, also pink and mauve, but very light and beautiful.

#### Dessert Table, Class 76.

The large dessert table, decorated with plants and cut flowers, and measuring 10ft by 4½ft, is one of the chief features of Shrewsbury summer show. The competition is usually keen, and each exhibitor is of the foremost rank as a fruit-culturist and decorator. There are fifteen dishes, selected from the schedule list, epergnes, vases, plates, &c., having to be supplied by the exhibitors themselves.

On this occasion the order of prizewinners was—First, the Earl of Harrington (gardener, Mr. J. H. Goodacre), Elvaston Castle, Derby; second, G. Farquhar, Esq. (gardener, Mr. G. Mullins), Eastnor Castle; and third, Hon. Mrs. Meynell Ingram (gardener, Mr. R. Dawes), Temple Newsam, Leeds, there being just three tables. Mr. Goodacre's contribution had the following, with the points received.

Vars.	Points obtained.	Max. available for each dish.
2. Apples (Washington and Ribston ..	6½ each	7
2. Apricots .. .. .	None	6
2. Cherries .. .. .	None	5
1. Figs (Turkey) .. .. .	5	7
4. Grapes (Muscat of Alexandria and another) .. .. .	5 and 7½	10
(Madresfield Court and Black Hambro')	6½ and 8	
2. Melon (Hero of Lockinge and a Seedling) .. .. .	7 and 6	8
2. Nectarines (Pine-apple and Elruge) .. .. .	7½ and 6	8
2. Peaches (Bellegarde and Princess) .. .. .	6½ each	8
2. Pears (Jules Guyot and Margaret Murillat) .. .. .	6½ each	7
1. Plum .. .. .	None	6
1. Strawberries .. .. .	None	6

For decoration the points were:—

Beauty of flower and foliage .. .. .	6½	8
Harmonious blending of colours .. .. .	7½	10
General arrangement for effect .. .. .	8	10

Total .. .. . 118½ points

All the fruits were excellent here, particularly good the Pears, Peaches, Nectarines, Melons, and black Grapes. In this first

table the flowers used were Francoa and Cheronia with Grasses, and Mr. Goodacre had much the lighter and sweeter arrangement. The decorations, however, have been better in former years.

Mr. Mullins (107 points) had fine Bigarreau Napoleon Cherries, a fair Royalty Melon, beautiful Apples, Gages, Nectarines and Peaches, the Pears not being so finished as in Mr. Goodacre's table. His Gros Maroc Grapes were as fine as could be, and on the side facing the wire-netting were Foster's Seedling in fair form. Mr. Dawes (97 points) had two splendid Madresfield Court bunches, long, shapely, and well finished. The Kirk's Plums were large and very handsome, as were the Dymond Peaches, Elruge Nectarines, and Figs. The decorations were quite too heavy.

#### Champion Grape Class.

Every active-minded gardener knows the importance of this great class. The Grapes shown herein are the choicest within these islands, which are moreover famed as producing the best samples in the world. Class 77 demands twelve bunches, in four or more distinct varieties, but not more than four bunches of any one variety, the premier award being a magnificent silver champion cup valued at fifty guineas. Along with this goes £20 in cash; the second prize being £16; the third £12, and so on. Three prizes are also awarded in this class for decorative arrangement. It will be remembered that Mr. Shingler, gardener to Lord Hastings, won the leading position last year, being his second win and possession of the cup, so that he only need win again to become owner for ever.

This time, however, he was third, the lead being taken by the Earl of Harrington (gardener, Mr. J. H. Goodacre) with Grapes of very high quality, the highest points last year being 109½, while this time the maximum is 115½. Of course the standard of pointing for black Grapes has been raised since last year, which might account for some of the difference, but it is surely very satisfactory to be presented with such excellent fruit. For the third time in succession, the Messrs. Buchanan, of Kippen Vineyards, came second, and we trust their efforts may yet be crowned with higher success. This year they were only two points behind the first prizewinner, having 113½.

We give a table showing the varieties staged, and the points gained by Mr. Goodacre.

1. Black Hambro' .. .. .	obtained 9	out of 10
2. Madresfield Court .. .. .	10	11
3. Muscat of Alexandria .. .. .	9	11
4. " .. .. .	10	11
5. " .. .. .	8	11
6. Muscat Hambro' .. .. .	10½	11
7. " .. .. .	11	11
8. Muscat of Alexandria .. .. .	9	11
9. Madresfield Court .. .. .	10½	11
10. Black Hambro' .. .. .	9½	10
11. Muscat of Alexandria .. .. .	8½	11
12. Muscat Hambro' .. .. .	10½	11
Total .. .. .	115½	

Messrs. D. and W. Buchanan, of Kippen, Stirling, only lost half a point on their Muscats, and had seven possibles. The bunches were very massive and grandly finished, and those who were judges of Grapes whistled with surprise when they saw how close the competition ran. The blacks here were Alnwick Seedling, Cooper's Black (not considered of such high quality as varieties as Madresfield Court, therefore points are lost), and the whites were all Muscat of Alexandria.

Lord Hastings (gardener, Mr. W. Shingler), Melton Constable Hall, had 107½ points, with great weighty Alnwick Seedlings and grand Madresfields, and altogether these were of a very high standard. Fourth came Colonel Platt, C.B. (gardener, Mr. W. A. Coates), Gorddino, whose Grapes were somewhat behind, and received a total of 105½ points. Two of the Black Hambro' bunches, however, were all but perfection, and he won first for table decorations. Separate prizes are awarded for decorations apart from the fruit. Second for this phase came Mr. R. Dawes (who was fifth for the Grapes); third, Mr. Goodacre. There were five entries.

#### Sixteen Dishes of Fruit.

These sixteen dishes, in not less than a dozen kinds, nor more than two varieties of each, in a space 8ft by 4½ft, brought forward three competitors. Each collection is decorated, and prizes awarded for effect. Mr. J. H. Goodacre was again foremost with excellent fruit of all sorts, including fine dishes of Turkey Apricot, Morello Cherries, Transparent Gages, Royal Sovereign Strawberries, Grapes, &c., and second for decoration. Mr. J. Dawes, Ledbury Park, was second (for fruit) with magnificent Sea Eagle Peaches and other good dishes, being third for his decorations; while third for the fruit collection, but first for decorative effect, came Mr. Jordan, of Impney, his fruits being thoroughly well ripened and of very high quality, the Grapes alone falling back.

COLLECTION OF TWELVE DISHES.—The first prize—a £10 note—for a dozen dishes in not less than nine kinds, without Pines, space 6ft by 4½ft, fell to Mr. R. Dawes, of Temple Newsam, with

(Continued on page 176).

### Notes on Roses.

It cannot be said the present has been an ideal season for Roses, especially of late. The recent continuous showery weather, accompanied with a low temperature, has all tended to premature decay of the blossoms. The larger H.P. and Tea varieties have suffered the most in that respect. It is for these reasons that I wish still further to advance the claims of so many varieties known as "garden" Roses, which are really so valuable where cutting for home use and the beautifying of the garden itself is the main cause of Rose culture. It cannot be said that garden Roses are not fitted for exhibition either, as no section commands more interest at shows than does this. Arranged loosely in good-sized bunches, accompanied, as they should be, with buds and their own foliage, they make a brave bid for popularity, and obtain it, too.

Now is a good time to make a note on the approved varieties, so that intending planters may have an opportunity of making a selection and placing their orders with advantage. It is but reasonable that those who take the trouble to order early get the best plants, and another point which I wish to emphasise is that of early planting. Roses are so unlike some other trees and shrubs. While many of the latter do not make autumnal roots, Roses do quite freely, which no doubt is a distinct gain for the future welfare of the plants. Garden Roses, like all other occupants of the garden, are becoming very numerous, so much so, that to the beginner the making of a selection in a limited way is a difficult matter. I therefore purpose to give a brief selection of what I know from experience are quite amongst the cream in their respective sections.

**SINGLE FLOWERED VARIETIES.**—Una is quite the best amongst many of white flowered sorts. The pure white, waxy looking petals make up a flower fully 5in in diameter. The yellow anthers, too, aid in beautifying the flower. The habit of growth is vigorous, producing strong sucker-like shoots, which produce abundance of its charming blooms. For a pole in a shrubby border, or on grass, this variety is quite one of the best. Electra belongs to the same type as the former, but is quite eclipsed by it. Those who like a single flowered Rose of a yellowy white colour will find in this a capital variety. The growth is strong, and its flowers are produced quite freely. The foliage is dense and lasting, which for garden decoration is desirable.

The Lion is a distinct improvement upon Carmine Pillar, which is saying a good deal, as this Rose has long been looked upon as the best of high coloured varieties. The newcomer is more intense in its colouring, and, if anything, flowers more abundantly; while in its manner of growth little is left to be desired. Dawn is another of the large blossomed type, the growth upright, vigorous, but perhaps a little stiff in appearance. The flowers are of full size, rosy pink, overlaid with silver.

Leuchtstern produces its flowers in great profusion in huge trusses. The colour is its great charm, being quite unique, deep rose pink, with a white eye. Growing out of doors the colour is so much intensified as compared to that when growing under glass. As a Rose for a pole this variety is unsurpassed. Euphrosyne for a pergola is quite a gem. The growth is so exceptionally free and pendant that a strong plant quickly covers much space. It is one of the earliest to open its pink flowers, which are borne in lengthened trusses or racemes. This is not strictly a single flowered variety, the earlier blossoms being semi-double. Brunonis for a pole or pillar is a charming variety, enhanced as it is by its glaucous foliage. The growth is free, erect, and produces huge trusses of the purest white blooms, emphasised as they are by the yellow stamens.

Moschata alba produces its large single blossoms quite freely. The petals are broad, white, faintly tinted with the palest pink. It is a vigorous climbing species that should find a place in every garden. Macrantha, although not one of the most vigorous in habit, is a strong grower. The great charm of this variety is its huge white blossoms, set off so by the yellow stamens.

Bardou Job has two rows of petals as a rule. It is a capital sort for filling a small bed, as it can be annually pruned quite low with success. The blossoming period lasts over a long season, as with every bit of new growth flowers are produced. The colour is intense bright crimson, overlaid with a velvety sheen.

Irish Beauty, Irish Glory, and Irish Modesty cannot be omitted, as they all three possess so much merit. The first is pure white, with yellow stamens. The second is marbled pink, and the latter coral pink suffused with ecru.

Wichuraiana is a type of Rose that is destined to become popular. The bulk of the varieties are evergreen, which is a step in the right direction. Pink Roamer is a single flowered variety, quite free in its method of flowering. Paul's Single White, treated as a H.P. in the matter of pruning, is a magnificent variety to plant in a mass. Its pure white flowers are borne in profusion, and are much enhanced by its deep green leaves and yellow anthers. Hebe's Lip, with its Picotee edging of purple on a white ground, is so exceedingly pretty that it cannot well be dispensed with.—E. MOLYNEUX.

(To be continued.)

### Propagating Roses by Cuttings.

The life of a Rose tree, be it bush or standard, is always somewhat uncertain, and where large quantities are grown many young plants are required each year to fill up gaps. All growers should, therefore, insert a few cuttings each year. The advantages of having dwarfs on their own roots are well known, and, excepting the cases of weak growers, succeed quite as well in other respects, when propagated by cuttings as by budding. August is an excellent month during which to insert cuttings, especially in the case of Teas. They can be rooted in the open air, but I prefer to place them under glass, and to keep them there till the following spring, because young plants are much more liable to injury by frost than older ones.

In regard to soil, a mixture of three parts of good loam and one part leaf soil, with sharp sand added, answers admirably. Select short jointed cuttings of either ripe or half-ripened wood, cut them from the parent plant with a heel attached when possible, and insert them round the sides of 5in and 6in pots, which have been well drained, and filled with the prepared compost. The soil should, of course, be pressed firmly. Cuttings with from five to eight joints answer well, and these should usually be sunk into the soil about half their depth. Give one thorough watering through a rose, and place the pots in a cold frame or handlight. Shade regularly for a time, and give no air, but sprinkle the cuttings once or twice daily during bright weather, and water the soil through a rose when it becomes fairly dry.

With such treatment 80 per cent. of the cuttings shoot root. When growth commences admit air gradually, and as soon as the cuttings are well rooted pot them into 4in or 5in pots according to their strength. Keep rather close again for a time, then gradually admit more air as growth advances. When the frosts of autumn come give just sufficient protection to prevent injury. The following May plant in nursery beds in the open air, and six or nine months later they will be ready for lifting and planting in permanent positions.

Cuttings of Hybrid Perpetuals, and other hardy kinds should be inserted in the open air. This may be done with every prospect of success from the present time till the end of November. October, however, I consider to be the best month in the whole year for carrying out such work. Select a piece of well-worked friable soil, and after having fixed the line in position, throw the soil back with a spade so as to leave a trench 3in or 4in in depth. In this insert the cuttings 3in apart, return the soil, and tread very firmly. Arrange the rows a foot apart. If this work is done now, the cuttings will need regular attention in regard to watering for some time, but when they are inserted during the autumn months one watering usually suffices. The autumn cuttings should be left undisturbed for a year, and then transplanted 1ft apart, but those inserted now should be transplanted next spring, and by the following autumn they should make nice little bushes.—H. D.

### Gardeners' Dinner Committee.

It is proposed to have a great gathering of gardeners during the autumn to dine together in London on the occasion of the great exhibition of British-grown fruits and vegetables at Chiswick, which takes place from September 29 to October 1 inclusive. The dinner will be held on the evening of the first day at the Holborn Restaurant. The carrying out of this intention has been entrusted to a committee of twenty. Nineteen of these, by arrangement met at the Holland House Show, and were photographed by Mr. J. Gregory, of Croydon, the other being unable to be present.

Circulars to the number of 800 have been issued to gardeners in all parts of the country, and 90 per cent. of the replies to these were favourable, so that we shall expect a very important and interesting meeting of gardeners next month. We give the names of those who met at Holland House, so that our readers may see that a wide interest is being taken in the meeting, and that the gathering will consist chiefly of gardeners, for the purpose of enabling those from a wide area of country to meet on a common platform and dine under one roof. Mr. Alex. Dean, of 62, Richmond Road, Kingston, and Mr. Edwin Beckett, Aldenham House Gardens, Elstree, Herts, are joint hon. secretaries. Mr. Owen Thomas, 25, Waldeck Road, Ealing, W., is chairman of committee; Mr. Leopold de Rothschild will preside at the dinner.

J. T. McLEOD      H. MARKHAM      C. R. ELLIOT      GEO. NORMAN      G. RYAN      J. SMITH      G. KELI      J. GIBSON      E. BECKLETT (Hon. Sec.)      C. HILLIER  
 GEN. W. D. W.      W. F. F.      C. DIXON      A. DEAN (Hon. Sec.)      OWEN THOMAS (Chairman)      J. HUDSON      E. WILLARD      W. HOWE      J. LANNING

**Gardeners' Dinner Committee.**

## Shrewsbury Floral Fête.

(Continued from page 173).

a high-class all-round set, particularly his Melons and Kirk's Plums. Mr. J. Jones, of York House, Malvern, was second, his Grapes being excellent. The decorative order here was Mr. J. Jones first, Mr. R. Dawes second.

**COLLECTION OF NINE DISHES.**—This, the eightieth class, was open to growers in the county of Salop only. The chief award, £5, was given by the president, the Right Hon. Lord Forester. Mr. C. Wilkins, of Ellesmere, led, being second in his decorations. Mr. J. Langley followed next; third, Mr. Bremmell, of Wellington (first for decorations); and fourth, Mr. C. Roberts, Halston Hall, being third in decorations.

Four bunches of Grapes, two blacks and two whites, prizes £6, £4, and £3. The bunches were good in the leading exhibits, and competition throughout was keen. Mr. J. Lambert beat Mr. R. Richardson, and third Mr. C. Wilkins.

Single bunch of Black Hamburg. J. H. Goodacre, J. Langley, Tedsmore Hall, and C. Bannerman as here named.

Two bunches of Madresfield Court. W. Shingler, J. H. Goodacre, and J. Langley in this order.

Alicantes, two bunches. W. Shingler, first; A. H. Hall, second.

Gros Colman or Gros Maroc, two bunches. W. Shingler, J. H. Goodacre, and G. Davies.

White Muscats. F. W. Everett, Tal-y-Cafn, having a grand bunch, quite 7lb in weight, well modelled and finished. Second, Mr. A. Richardson, Llanfairfechan; third, J. W. Goodacre.

Single bunch of White Muscats. Messrs. Buchanan, Kippen; A. F. Hall, Prestbury; 3, J. H. Goodacre; the competition being keen.

Two bunches of white Grapes, any other sort. A. H. Hall; A. W. Coates, Gorddinnog; F. W. Kerr, Chorley, Lanes.

Diamond Jubilee Grape, one bunch. F. Jordan, Impney Hall, first; J. H. Goodacre, second; and A. H. Hall, third.

Black Hambros, open to Salop only. Mr. T. Lambert, Brogyntyn; J. Langley; and C. Wilkins, Oteley, Ellesmere.

Two bunches black Grapes, any other variety, open to Salop only. Mr. T. Lambert; J. Langley, Tedsmore Hall; G. Davies, Frankton, out of seven entries.

White Muscats, Salop only. Mr. T. Lambert, Brogyntyn; J. Mills; S. Bremmell, Oswestry.

Any other white Grape, Salop only. Mr. J. Mills, Market Drayton; E. P. Thompson; W. Ashwood; there being five contestants.

Two bunches black Grapes (class 95). Messrs. W. Ashwood and W. Evans, in this order.

Two bunches white Grapes. Mr. W. Ashwood, Admaston; A. Jones, Oaklands.

Six Peaches. Mr. R. Greenrod, Whitefield, Hereford; R. Davies; F. Jordan, Impney.

Six Nectarines. Mr. W. Pilgrim, Anglesey; G. Lilley, Gaddesby Hall, Leicester; and F. Jordan.

Six Apricots. Major Clive, with Early Red; W. L. Bastin, Buscot Park; and W. Humphries, Holme Lacey.

Green-fleshed Melon for flavour. Mr. J. H. Goodacre; S. Bremmell; A. Ruddock.

Scarlet-fleshed Melon, ditto. Mr. R. Lawley, Adcote, with Sutton's Triumph; F. Jordan; and W. A. Webster.

White-fleshed Melon, ditto. Mr. G. Lilley, Leicester; F. Jordan, a fine British Queen; and W. A. Webster, Dodington; there being eleven fine fruits.

Twelve Gage Plums. Mr. J. H. Goodacre; J. Langley; and F. Jordan.

Twelve yellow Plums, other than Gage. J. H. Goodacre; and J. B. Wood, of Ludlow.

Twelve purple Plums. Mr. Goodacre; J. Dawes; J. Langley.

Twelve red ditto. Mr. J. Goodacre; J. Dawes, Ledbury Park; and J. Langley.

Dish of Cherries. Mr. A. Ruddock, Bangor; W. Powell, Addleston, Surrey; W. Pilgrim, Bodorgan, Anglesey.

Classes 108 to 112 were open to Salop only. Six dishes of hardy fruits—Mr. G. Davies; G. Gilbert, Wem; and H. Huxter, Ludlow.

Five cooking Apples. Mr. H. Huxter, first out of thirteen; W. Dovaston; and J. Abbott.

Six Plums. Mr. H. Huxter; J. Mills; Jos. Farrant.

### Vegetables.

Although this section does not attract the general public like the plants and flowers, it certainly proved attractive to the exhibitors, for the majority of the classes were well filled. It is quite impossible to give details of all the classes. The chief interest appeared to centre round the collections offered by the leading firms.

Messrs. Sutton and Sons, Reading, offered substantial prizes for a collection of nine varieties, which produced a keen competition. Mr. J. Gibson, gardener to R. W. Hudson, Esq., Danesfield, Great Marlow, won first prize with Prizetaker

Leeks, Autumn Mammoth Cauliflower, Perfection Tomatoes, Best of All Runner Beans, Windsor Castle Potatoes, Ailsa Craig Onions (grand), Solid White Celery, good enough for a November show, New Red Intermediate Carrots, and the Gladstone Pea, a grand collection, well displayed. Mr. E. Beckett, gardener to Lord Aldenham, Elstree, was a good second, having as his best dishes Ailsa Craig Onions, Best of All Runners, Windsor Castle Potatoes, and Perfection Tomatoes. Mr. B. Ashton came in a good third.

Messrs. Jas. Carter and Co., High Holborn, offered similar prizes for an equal number of kinds, and the fight was again pretty keen. Here Mr. E. Beckett scored well, taking premier honours with a model collection. The subjects used were Holborn Model Leeks, Solid White Celery (excellent), Autumn Giant Cauliflower, Ailsa Craig Onions (good), Duke of York Tomatoes, Model Telephone Peas, which were models, Elephant Runner Beans, Windsor Castle Potatoes, and Scarlet Perfection Carrots. Mr. D. Gibson, gardener to Mrs. Johnston, Kingston-on-Thames, was a capital second, having good examples of Jubilee Runners, Ailsa Craig Onions, Up-to-Date Potatoes, and Duke of York Tomatoes. Mr. B. Ashton was third with a grand dish of Alderman Peas.

Messrs. R. Smith and Co., Worcester, contributed special prizes for nine varieties, which again brought out a strong competition, Mr. R. A. Horspool, Ruabon, taking the blue ribbon. His varieties were new Exhibition Leeks, Autumn Giant Cauliflower, Solid White Celery, Ailsa Craig Onions, The Gladstone Pea, Intermediate Carrot, Windsor Castle Potatoes, Smith's Masterpiece Tomatoes, and White Model Turnips. Mr. E. Beckett was second with good typical examples of Ailsa Craig, Worcester Prolific Tomatoes, and Smith's Bountiful Pea. Mr. S. Bremmell third.

Handsome prizes were also offered by Messrs. Webb and Sons, Stourbridge, for eight distinct kinds. Again there was a good entry. Mr. B. Ashton was awarded first prize for a fine collection. His kinds were Peerless Cauliflower, Solid White Celery, Champion Prize Leeks, New Prizewinner Runner Beans, Renown Potatoes (very good), Chancellor Tomatoes, Kaiser Peas, and Ailsa Craig Onions. Mr. W. L. Bastin, gardener to Sir A. Henderson, Buscot Park, Faringdon, was second, and Mr. W. Folkes, gardener to the Rt. Hon. T. F. Halsey, M.P., Hempstead, Herts., brought up the rear.

The silver challenge bowl, valued at £15, and offered by Mr. R. Sydenham, Tenby Street, Birmingham, for the greatest number of points, was again won by Mr. W. Leith, gardener to Col. O. R. Middleton, The Chase, Ross, who has now secured the necessary third victory, and the handsome bowl now becomes his property. In most of the single dish classes the competition was good and the entries numerous. This was especially so in the classes for Onions, Parsnips, Celery, Runner Beans, Potatoes, Tomatoes and Peas.

### Certificates and Awards of Merit.

Carnation Aglaia (A.M.), from F. Bouskell, Esq.

Carnations Mrs. Nicholson and C. Gladys, both A.M.'s, from Mr. Aldersey.

Chrysanthemum maximum leucanthemum (A.M.), from F. Bouskell, Esq.

Chrysanthemum maximum King Edward (F.C.C.), from W. Angus, Penicuik, N.B.

Dahlias (Cactus): Brightness (F.C.C.), Shrewsbury (A.M.), and Golden Drop (A.M.); each from S. Mortimer, Rowledge, Surrey. \* \* Lucifer (F.C.C.), from Dobbie and Co.

Hippeastrum Guiding Star (F.C.C.), Meteor (F.C.C.), Vesta (A.M.), Draconis (A.M.), all from Capt. Holford.

Carnation Queen (A.M.), from Mr. Jos. Lambert, Southport.

Senecio elivorum (F.C.C.), from J. Veitch and Sons, Limited; also

Astilbe Davidi (F.C.C.), from the same.

### Non-competitive Exhibits.

Mr. Amos Perry, of Winchmore Hill, London, struck out a new line in horticultural exhibiting by staging a group of water plants, having Nymphaea blooms in front. His table contained the comparatively new Glyceria spectabilis fol. var., and the graceful Miscanthus gracilis. Juncus zebrinus and J. spiralis were also noted; but there were a great variety of subjects. A variety of the Water Forget-me-not named The Czar, and the Myriophyllum proserpinoides were here.

Messrs. Dobbie and Co., of Rothesay, here staged the collection of Potatoes noted in our report of the Drill Hall Show. They had in addition cut Dahlia flowers, including Mrs. Mawley yellow, J. J. Jackson deep crimson, Ibis, orange-cochineal; P. W. Tulloch, rosy-mauve, with bronze centre; and they had many other new varieties. Besides these, there were pompon Dahlias, and a fairly large selection of Pansies.

Messrs. Jackman and Son contributed a collection of herbaceous cut flowers of the best and showiest sorts, with Alpines naturally arranged in rockwork. The selection was choice, and must have greatly pleased the lovers of these plants.

Oranges and other species of the Citrus tribe were brought forward by Miss Talbot (gardener, Mr. R. Milner), Margam

Park, Port Talbot, and were backed by the new *Asparagus myriocladus*, the latter from the Ranelagh Nurseries Co., Royal Leamington Spa.

Mr. A. Myers, Sutton Lane Nurseries, Shrewsbury, showed much skill in floral arrangement, as well as in cultural merit, by the beautiful display of Zonal Pelargoniums he made, and which included considerable variety.

Phloxes, fragrant and fresh, came from Dicksons, Chester, whose finer varieties were Frau S. Buchner, a rosy purple; Tunisie, a deep purple; Amazon, soft white; and Flambeau, cerise-scarlet. They had also *Centaurea macrocephala*, *Gladioli*, and various *Tigridias*, &c. Their selection of stove plants showed them to be as strong here as in outdoor department.

Mr. Bouskell, Market Bosworth, was represented by a large and good collection of herbaceous plants, many of them of the choicest. Messrs. Hewitt and Co., of Solihull, had an immense bank of cut hardy flowers most effectively set up, and in this respect a good object lesson. We can hardly do more than mention such good things as *Silene acaulis*, *Asclepias tuberosa*, the golden-rayed Lily, and the purple-leaved *Prunus*.

#### Dahlias, Roses, Amaryllis.

Dahlias were most strongly staged by Keynes, Williams, and Co., of Salisbury, all types being represented. From Backhouse and Son, York, there came a goodly collection of dwarf evergreen subjects, with alpine and aquatic vegetation, each and all suitable for rockeries and the environs thereof. The Grass of Parnassus, *Campanula pulla*, *Daphne Cneorum*, *Gentiana acaulis*, *Sibthorpia europæa*, and *Glyceria aquatica* fol. var. were included amongst the many other things.

Roses from Edwin Murrell, of Shrewsbury, filled one large bay, and were exceedingly brilliant and effective. We were able to take note of *Perle des Jardins*, a fine yellow Tea; *Gruss an Teplitz*, Mrs. W. J. Grant, Killarney, Liberty, Oskar Cordel (H.P.), *Niphetos*, and others, all in their best form and deeply coloured.

New or rare stove plants came from Bull and Sons, of Chelsea, with *Polypodium irioides ramo-cristatum*, *Draeana Goldiana*, *Ceropegia Woodii*, *Dracæna Victoria*, and such other things. Their hybrid *Rex Begonias* deserve a special note.

And *Amaryllis* (or *Hippeastrums*), how came they here in the month of August? Only by the great enthusiasm of that noted grower of them—Mr. Chapman, gardener to Capt. G. L. Holford, at Tetbury. People hardly realise what it means to be able to stage a group of *Amaryllis* at this season; and we were able to see the bulbs lying in a retarding room, during a visit made in June. The flowers and plants were finer, and certainly stronger than their neighbours of the early part of the year. The following were put up for certificate: *Guiding Star*, *Vesta*, *Draconis*, *Ceres*, *Argus*, and *Meteor*.

#### Pentstemons, Sweet Peas, Shrubs.

Mr. John Forbes, of Hawick, Scotland, was able to show some selections of his notable strain of *Pentstemons*, *East Lothian Stocks*, *Carnations*, and *Pansies*, all admirably staged. The wide, open-mouthed flowers and pleasing shades of the following *Pentstemons* were most satisfactory: *Ninon de Lenelos* (white), *Alex. McKinnon* (carmine-scarlet with light throat), *Cigèle* (white throat with rosy edge), Mrs. Forbes (purple, and like a *Gloxinia* for size), together with *Lady Arthur*, *Gaston Tissandier*, *Paul Camborn*, and Mrs. B. Cowan. The *Stocks* were really "stecky" and very meritorious altogether.

Sweet Peas from Mr. Eckford, of Wem, renewed the interest in these most fragrant annuals. He staged quite a large display, and had *Lovely*, Hon. Mrs. Kenyon, *Venus*, *America*, *Fascination*, *Monarch*, *Duchess of Westminster*, *King Edward VII*, *Scarlet Gem* (the best of recent years), *Lottie Eckford*, *Lady Beaconsfield*, *Agnes Johnstone*, and *Blanche Burpee*.

Messrs. Clibrans, of Hale, Altrincham, had hardy plants and shrubs. Their *Tradescantias*, *Ulmus campestris*, *Louis Van Houtte*, *Cornus siberica aurea* Späthi, *Acer platanoides laciniata*, *Robinia mimosæfolia*, *Acer dasycarpum heterophylla laciniata*, and *Acer colchicum tricolor* were each beautiful. Their Sweet Peas, *Carnations*, *Phloxes*, &c., made up a bright display.

Tuberous double *Begonias* and double Zonal Pelargoniums were sent from Cork by Hartland and Son, and some of their varieties were really very excellent, as witness their *Begonia Prof. Lanciani*, and Mrs. Moyer.

The double *St. Brigid Anemones* from Reamsbottom and Co., Alderboro', Geashill, quite freshly in flower, reminded one that the planting season is again at hand. Messrs. W. and J. Brown, of Peterboro', staged florist flowers, and Jarman and Co., of Chard, had Dahlias, &c.

Mr. Vincent Slade, of Taunton, Som., contributed Zonal Pelargoniums, amongst the best being *Barbara Hope* (rosy), *Lilian Duff* (scarlet), *Snow Storm* (white), *Wordsworth* (scarlet), *Andrew Lang* (scarlet, white centre), and Mrs. K. Barnes (blush Rose), all of these being singles. He had amongst doubles, *Thos. Moore*, *Mme. Vandry*, *M. Hasti*, *Mme. Charlotte*, *Pasteur*, and *Mme. Carnot*, the latter a good white.

The group staged by Hobbies, Limited, was at once the

acme of perfection in taste, and comprised first rate material. They staged *Cactus Dahlias*, *Ibis*, *Dainty*, *Beacon*, *Mr. Amos Perry*, *Ida*, and *Winsome*. The *Roses* were very showy, and the new *Dorothy Perkins* was better than in the height of summer.

Mr. T. R. Hayes, Keswick, made an interesting display of hardy *Ericas*, *Ferns*, and a few hardy flowers. The *Ericas* were staged in baskets, and were much admired; *E. vagans alba*, *E. V. Hammondi*, and the golden variety were most conspicuous. A basket of *Scolopendrium crispum majus* was excellent. Cut blooms of *Romneya Coulteri* were also noted.

#### Gloxinias, Carnations, Fruit Trees.

Messrs. Sutton and Sons, Reading, made a grand display of *Gloxinias*, the plants were good, and the strain could hardly be surpassed. Crested *Begonias* were also exhibited with a few *Celosias*, the whole being tastefully arranged with light *Palms* and small *Maidenhair Ferns*, which made it most bright and, withal, refreshing.

Hardy flowers were nicely staged by Mr. J. H. White, Worcester, *Montbretias*, *Monardias*, *Gladioli*, *Begonias*, *Phloxes*, and Dahlias being well represented, the front of the table being edged with a large variety of trailing plants.

Messrs. Laing and Mather, Kelso, arranged a table of *Carnations* in first-rate style, chiefly of the border type, though *Malmaisons* and *Trees* were to be seen. The leading varieties were *H. J. Cutbush*, *Waverley*, *Marmion*, Mrs. T. W. Lawson, and Mrs. Nicholson. The blooms exhibited no sign of the weather experienced down south.

Messrs. T. Rivers and Son, Sawbridgeworth, occupied a bay in the large tent with a grand collection of fruit trees in pots; they consisted of *Peaches*, *Peregrine*, small trees loaded with fruit, *Champion* and *Milton*; *Nectarine*, *Dryden*; huge fruits of *Peasgood's Nonesuch Apple*; *Apricots* in variety; *Plum Late Orange*, a tree three years old carrying seventy-four fruits. The pot Vines trained as *Ferns* were quite pictures. *Cherries* were also well represented. The collection could only be described as perfect.

Messrs. Pritchard and Sons, Shrewsbury, made a nice show of *Ferns*, chiefly in decorative sizes, with a few *Dracænas* and *Crotons*. The exhibit was refreshing amongst so many gay groups, and was admirably staged.

Messrs. Gunn and Sons, Brookfield Nursery, Olton, occupied a large table with hardy flowers. The *Phloxes* were fine, and did not appear injured by the weather. *Liliums* in variety were also notable, as were also *Gaillardias*, *Statice*, and *Sidalcea Listeri*. The whole were well arranged.

Mr. H. Deverill, Banbury, sent hardy flowers in good variety and a large collection of cut Zonal Pelargoniums arranged with small *Maidenhair Ferns*. The trusses were large, bright, and fresh, and attracted much notice.

*Begonias* came in force from Messrs. Blackmore and Langdon, Bath. The blooms were exceedingly fine and well staged, as they usually are from this firm.

Mr. J. Russell, Richmond, had an effective display of foliage plants such as *Dracænas* in variety, some well coloured *Crotons*, *Abutilon Savitzi*, *Alocasias*, and *Caladiums*. The specimens were well grouped, and the whole finished off well.

A nice group of *Caladiums* were put up by Messrs. J. Peed and Son, West Norwood. The plants were large, in splendid condition, and nicely displayed.

Messrs. Jas. Veitch and Sons, Limited, Chelsea, had baskets of *Senecio clivorum* and *Astilbe Davidi*, both recently described in these pages.

#### Medal Awards.

The following awards were made to honorary exhibits:—

Large gold (special award) to Rivers and Son; to Captain Holford; to Sutton and Sons; and Hobbies, Limited.

Small gold medals to J. Peed and Son; John Russell; Jarman and Co.; Ranelagh Nursery Co.; Dicksons, Chester; W. B. Child; Blackmore and Langdon; Edwin Murrell; R. Smith and Co.

Silver-gilt medals to Amos Perry; W. Cutbush and Sons; F. Bouskell, Esq.; Hewitt and Co.; John Forbes; T. R. Hayes; Davies and Sons; H. Deverill; J. H. White; Henry Eckford; W. Clibran and Son; and Reamsbottom and Co.

Silver medals to Laing and Mather, Kelso; Vincent Slade; B. Hartland and Sons; F. M. Bradley; W. and J. Brown; R. Milner, and J. Backhouse and Son.

#### Nine Novels—4000 Trees.

A recent calculation was made showing what an immense quantity of timber is used to supply the present-day readers with the substance for their popular novels. Estimating that nine novels have a total sale of 1,600,000 copies, each book containing 20oz. the total weight is 2,000,000lb of paper. Spruce is used to make the cellulose for the paper, each tree yielding about 500lb. A simple calculation shows, therefore, that these nine novels alone swept away 4,000 trees. We wonder whether they were worth it.—("Commercial Intelligence.")

## Societies.

### Royal Horticultural, August 18th.

The hall on this occasion was full throughout. Gladioli, Bouvardias, and hardy flowers forming the chief features, though mention should be made of the fine collection of Apples and Potatoes. Orchids were well represented for the season.

#### Orchid Committee.

Present: H. Little, Esq. (in the chair); and Messrs. J. O'Brien, H. M. Pollett, W. Cobb, J. Douglas, F. Wellesley, G. F. Moore, H. Ballantine, H. T. Pitt, E. Hill, W. Boxall, F. J. Thorne, H. A. Tracy, W. H. Young, and T. W. Bond.

Orchids were represented by five nice groups, as well as a number of odd plants from various exhibitors. A well-arranged group came from Mr. H. T. Pitt, Stamford Hill. A few of the best were *Cypripedium Felicity*, *Laelio-Cattleya Wm. Pitt*, *Odontoglossum Florrie*, the quaint *Bollea coelestis*, *Cattleya Gaskelliana albens*, and *L. C. Myra*.

Messrs. Stanley Ashton and Co., Southgate, also contributed a beautiful collection, the chief being *Laelia Iona* Southgate variety, *L. Amanda*, a natural hybrid, a well flowered plant of *C. Loddigesii*, *L.-C. Massangeana*, and a few nice *Cypripediums*.

Messrs. Charlesworth and Co., Bradford, made a nice display, having good plants of *Cattleya Germania*, *C. Niobe*, *C. Iris*, *Laelio-Cattleya Callistoglossa*, *L.-C. Bletchleyensis*, a fine form, and *L.-C. Iona Superba*. A nice plant of *Brassia Lawrenceanum longissima*, *Stanhopea oculata*, and a few nice *Cypripediums*. A few fine specimens came from Capt. Holford, Tetbury, which included a fine piece of *Laelio-Cattleya Callistoglossa* variety *exelsa*, *C. Germania Superba*, *L.-C. Eximia*, a well flowered plant of *Vanda cœrulea*, and *C. imbricata*.

Mr. Geo. Matthews, gardener to Lord Auckland, Kitley, Plymouth, sent a spike of *Oncidium luridum guttatum*, which measured seven feet six inches long and carried two hundred and thirty-one flowers.

#### Floral Committee.

Present: H. B. May, Esq. (in the chair); and Messrs. C. E. Drury, G. Nicholson, R. Dean, J. Jennings, W. Howe, G. Reuthe, C. Dixon, C. Jeffries, J. W. Barr, C. E. Pearson, R. C. Notcutt, W. Cuthbertson, H. J. Jones, C. E. Shea, W. P. Thomson, E. H. Jenkins, W. J. James, Geo. Paul, and Amos Perry.

Messrs. Kelway and Son, Langport, staged a grand collection of Gladioli in four rows running the entire length of the hall. The spikes were beautifully developed, and many of the varieties of great merit. A few of the best were Mrs. Foster, Numa, Eclipse, Frank Miles, Mrs. F. Field, Lord Swansea, Burgh Westra, Sir Evelyn Wood, Western Glory, Sir J. Llewelyn, The Sultan, Prince of Orange, Tros, Grandeur, Lord Hawke and Lucus.

Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, contributed a large exhibit of miscellaneous flowering plants, which occupied a table 56ft long. The chief feature being a collection of Bouvardias in 5in pots, which were dwarf and well flowered. The varieties were arranged in blocks. The most conspicuous being Hogarthi flore-pleno, King of Scarlets, alba odorata, President Cleveland, Bridesmaid, President Garfield, and Reine des Roses.

From Messrs. J. Peed and Son, West Norwood, came a nice exhibit of hardy flowers and rock plants. In the former were noted good bunches of Phloxes, Tritomas, Statice latifolia, Gladioli, and Helianthus. The rock and alpine plants were composed chiefly of *Sempervivums* and *Saxifragas*.

Messrs. Paul and Son, Cheshunt, made a capital display of Phloxes and hardy shrubs. The best Phloxes were Iris, Coquelicot, Miss Pemberton, Mrs. J. Barker, Fiancée, Grevin, and Le Madhi. The most noteworthy shrubs being *Tamarix hispida æstivalis*, *Colutea melanocalyx*, and *Cornus Gonchaltz*.

An interesting exhibit of Gladioli, named Goff's Canadian hybrids, came from Mr. H. Ballantine, gardener to Baron Schröder, The Dell, Egham. The flowers were remarkable for their rich and varied colours, some of them being quite new in colour and marking. Judging from appearances, they look like a cross between Child's and Lemoine's hybrids.

Dahlias were nicely staged by Messrs. J. Cheal and Sons, Crawley. The Cactus varieties occupied the centre, flanked on either side by pompon and single forms. The most conspicuous being Eva, Alpha, Ajax, Mrs. E. Mawley, J. H. Jackson, Clara G. Stredwick, Mrs. H. F. Perkins, Lyric, and Cheal's White. The pompoms were rather large, but of good form, while the singles were staged in Messrs. Cheal's well-known style.

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, also contributed a charming box of hybrid *Streptocarpus*. The flowers were very varied in colour, and the plants carried plenty of blossom.

Messrs. Jas. Veitch and Sons, Ltd., Chelsea, made an interesting exhibit composed of large baskets of *Senecio clivorum*, *Sambucus canadensis*, *Watsonia Meriana* Arderni, beautifully deve-

loped, and *Astilbe Davidi*, with rosy purple heads, all arranged on the floor.

Frilled Begonias in a fine range of colours came from Herr W. Pfitzer, Stuttgart. The blooms were of good average size and beautifully frilled. The same exhibitor also staged a variety called Bavaria, somewhat like the popular Gloire de Lorraine, having deep rosy flowers.

Mr. E. Potten, Camden Nurseries, Cranbrook, staged a nice table of hardy flowers, the Phloxes being especially good. A few large bunches of *Trollius* excited a good deal of interest, while a good collection of *Pentstemons* were also noted.

Mr. Amos Perry, Winchmore Hill, made an imposing display of hardy flowers, in which were noted *Coreopsis verticillata*, *Astilbe chinensis*, *Fuchsia globosa*, *Rudbeckia purpurea*, Winchmore Hill variety, *Buddleia variabilis*, *Asclepias incarnata*, *Chrysanthemum latifolium* var. *Perfection*, and *Statice Limonium* in red, white, and blue varieties. The whole exhibit being tastefully arranged and displayed.

Hollyhocks came from Messrs. Webb and Brand, Saffron Walden. The back of the exhibit was formed with eighteen splendid spikes in as many colours, while twelve dozen blooms formed the front. The flowers were as double as could be, and the colours left little to be desired. A little *Asparagus foliage* and *Gypsophila* relieved the formality of the exhibit.

Mr. B. Ladhams, Southampton, staged a table of Lobelias, Gaillardias, *Chrysanthemum maximum* Monarch in fine form. *Heliopsis* B. Ladhams, and a variety of perpetual flowering Pinks.

From Messrs. Barr and Sons, Covent Garden, came a large display of hardy flowers and Water Lilies, also an interesting display of hardy Ericas. The Phloxes were staged in good variety. Violas were also prominent, but they do not lend themselves to arrangement in jasper vases. A huge group of *Tritomas* were also noted, and the pretty *Chrysanthemum maximum* W. Robinson was much admired. The dull day did not encourage the *Nymphæas* to open, or they would have made a nice display.

Mr. Jas. Hudson, gardener to L. de Rothschild, Esq., Acton, staged fine *Nymphæas* in fine form. They were *N. stellata pulcherrima*, *N. gigantea Hudsoni*, *N. stellata*, Berlin variety, *N. W. Stone*, a very deep blue, and a night blooming variety called George Huster, a bright rosy red with narrow petals, a splendid form.

#### Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); and Messrs. H. Balderson, J. Cheal, H. Esling, W. Bates, A. Dean, J. Basham, G. Kelf, H. Markham, O. Thomas, J. H. Veitch, J. Jacques, J. Willard, G. Wythes, and F. Q. Lane.

Messrs. S. Spooner and Sons, Hounslow, contributed a fine display of Apples, staged in baskets and boxes. There was a good number of each variety exhibited. The fruits were large and certainly well coloured for the season. Lady Sudeley, Pott's Seedling, Beauty of Bath, Mr. Gladstone, Lord Grosvenor, Red Astrachan, Williams' Favourite, Red Quarrenden, Worcester Pearmain, and Grenadier, were most conspicuous, and formed a fine feature.

Messrs. Dobbie and Co., Rothesay, staged twenty-five baskets of early and second early Potatoes. The tubers were all grown at Orpington, and were grand examples of culture; every basket contained only clean, typical specimens. The best varieties were Early Puritan, Lord Beaconsfield, Windsor Castle, Ninetyfold, Sir J. Llewelyn, Mr. Bresee, Eightyfold, The Factor, Crimson Beauty, and British Premier.

The Rev. G. F. Eyre, Fen Forest, Rock S.O., sent a fine dish of Peas called The Logan. Mr. J. Bowerman staged a new Runner Bean called Hackwood Success. The pods were over a foot long, bright green in colour, straight, and of good form.

From Mr. Geo. Kent, Norbury Park Gardens, Dorking, came a bunch of Norbury Seedling Grape, which has large berries, but the bunch appeared over-thinned.

Mr. J. Hudson, gardener to L. de Rothschild, Esq., Gunnersbury House, Acton, staged a nice basket of Strawberry Royal Sovereign. The fruits were of good size and bright in colour. It would be interesting to know how Mr. Hudson produced such fine fruits so late in the season.

Mr. H. Parr, Trent Park, New Barnet, staged a box of Tomatoes named Coronation, but the fruits were too large for general purposes.

A fine box of Peach Peregrine came from Messrs. T. Rivers and Son, Sawbridgeworth, the fruits being large and well coloured.

Mr. G. Wythes, gardener to the Duke of Northumberland, sent up a new Melon, and also a Vegetable Marrow, a cross between Custard and Turk's Cap.

#### Medal Awards.

ORCHID COMMITTEE.—Silver Floras, for groups of Orchids, to Stanley Ashton and Co., Southgate; Capt. Holford, Tetbury; Charlesworth and Co., Bradford; H. T. Pitts, Esq., Stamford Hill.

FLORAL COMMITTEE.—Mr. H. B. May, Upper Edmonton, for

Bouvardias; Messrs. Kelway, Langport, Somerset, for Gladioli. Silver-gilt Banksian for group of Hollyhocks to Messrs. Webb and Brand, Saffron Walden. Silver Flora for group of herbaceous plants to Messrs. J. Veitch and Sons, Chelsea; and for hardy cut flowers to Messrs. Bull and Sons, Chelsea. Silver Banksians for group of hardy flowers to Mr. E. Potten, Cranbrook, Kent; and to Mr. Amos Perry, Winchmore Hill; for Dahlias and shrubs to Messrs. J. Cheal, Crawley; and for hardy flowers to Messrs. Ladhams, Ltd., Shirley, Southampton.

FRUIT COMMITTEE.—Silver-gilt Knightians, to Messrs. Dobbie and Co., Rothsay, for collections of early Potatoes, and to Messrs. S. Spooner and Sons, Hounslow, for collection of Apples.

#### Certificates and Awards of Merit.

*Bean, Hackwood Success* (J. Bowerman).—A Scarlet Runner of fine proportions, about 15in. long, bright green, and even throughout; an acquisition. A.M.

*Begonia Bavaria* (W. Pfitzer).—A bright rosy variety, apparently of the Gloire de Lorraine type, very free-flowering. A.M.

*Gladioli, Lady Muriel Digby* (Kelway).—A soft creamy yellow, with a blotch of red on the lower petal. A.M.

*Gladioli Nymph* (W. C. Bull).—A large white variety with a little crimson at the base, spike badly twisted. A.M.

*Lælia Iona, Southgate variety* (Stanley Ashton and Co.).—A cross between *L. pumila* and *L. tenebrosa*, the sepals and petals rosy purple, with a deep purple lip. A.M.

*Peach Peregrine* (T. Rivers and Son).—A large fruit, well coloured almost all over, of exquisite flavour. A.M.

*Tamarix Odesana* (Paul and Son).—A pale form, carrying large heads of bloom. A.M.

#### Chippenham, August 12th.

The Chippenham Horticultural Society has so long enjoyed a succession of fine days for their fixture, and has secured such a large share of local patronage, that the day is looked upon as a necessary holiday in the district. The elements once again favoured the fortunes of their exchequer, the attendance being larger than ever, as also were the number of entrants in competition.

The increase in the value of the prize offered for a group of 120 square feet stimulated a larger interest and a much greater effort to excel, and the result was considered a full justification of the committee's action. Messrs. Cray and Sons, Frome, with a bright, pleasing, and choice assortment of foliage and flower, made a successful claim for first prize. Messrs. Cole and Son, Bath, took the second place with an excellent arrangement of choice and suitable material, though it lacked the brightness of the premier exhibit. Mr. Bible, gardener to the Prince Hatfeldt, Draycot, was third. Fuchsias were good, the veteran grower, Mr. G. Tucker, being defeated by Mr. H. Pocock, Hilperton, with beautifully fresh and well-flowered specimens.

Mr. Tucker easily won in the class for six specimen flowering plants, Messrs. G. Hallett, Bath, and J. B. Wood and Son, Chipping Sodbury, following. Mr. Tucker excelled in single and double Tuberosus Begonias, and also Ferns, six of each. His plants were models of good culture. Mr. Strugnell took the lead from Messrs. Wood and Hollett for three Palms, and Col. Vivian's gardener won also with six Caladiums. Liliiums, table plants, and Zonal Pelargoniums made an extensive show.

Roses were excellent, large, fresh, and bright, and the competition both keen and extensive. Messrs. Jefferies and Son, Cirencester, won from Messrs. Townsend and Son, Worcester, and Perkins, Coventry, for thirty-six varieties in a close contest. King's Acre Nurseries, Ltd., took the premier card in the next class for twenty-four varieties, Messrs. Mattock, Oxford, and Jefferies following. With twenty-four distinct Show and Fancy Dahlias, Messrs. Cray and Sons, and G. Humphries, Kington Langley, were the winners, the same growers securing the prizes for twelve Pompon and the same number of Cactus in triplets. Messrs. Blackmore and Langdon, Bath, won easily in the class for Carnations, twenty-four blooms, Messrs. Hooper and Alden, also from Bath, following, the contest being keen, and the blooms of high merit.

Mr. Tucker scored with twelve bunches of stove and greenhouse cut flowers, and Messrs. Stokes and Son annexed the first prize for herbaceous flowers with an excellent collection. Messrs. Jefferies and Mattock staged beautiful Gladioli in twelve varieties, and Mr. W. D. Porter, Bath, defeated the usually successful Chippenham grower, Mr. Humphries, with herbaceous Phloxes.

Fruit, both in extent and quality, surprised not a few among exhibitors and visitors, Apples and Plums, which are so notoriously scarce, being so well staged here. For a collection of eight varieties of fruit, Mr. Strugnell, Mr. Pitts, gardener to Sir Audley Neeld, Grittleton, and Mr. H. Jones, Bath, won in the order of their names with fruit of high merit. Messrs. Radman and Son won with black, and B. de Bertodano, Esq., with white Grapes; T. Harris, Esq., Colne, and Col. Vivian taking the prizes for one and three dishes of Peaches respectively. With Nectarines, Messrs. Bible and Harris won with beautifully coloured Pine-apples. Mr. Cook, Neston Park, with

three dishes of culinary, won from Mr. E. Hall, Bath, both staging really nice fruits of Warner's King and Ecklinville. Positions of these exhibitors were reversed in the class for three dishes of dessert Apples. Cherries were scarce, and Pears still more so.

Table decorations proved an interesting annex, and created a deal of criticism on the part of exhibitors and visitors. A tent was devoted exclusively to these ladies' exhibits. Mrs. Colston Hale, Warminster, Mrs. Fisher, Bath, and Miss Compton, Malmesbury, were the prizewinners, but much debate was to be heard bearing on the tastes and decisions of the lady judges. One very handsome table dressed with Orchid blossoms was absolutely ignored, while one much overdone with a poor coloured Sweet Pea arrangement was admitted into the select list. With Messrs. Perkins' shower bouquet of beautiful Orchids came free and frequent commendation of praise, Messrs. Cole and Son, Bath, and Mr. W. D. Porter, Bath, also showing well.

Classes provided for the district did not bring out anything strikingly meritorious, and the popular opinion freely expressed was that the prizes would be better spent in improving other existing open classes. Amateurs' and cottagers' sections are a strict necessity, and are well responded to, but the district competition is made poor by the small area affected, and the paucity of entries made by local gardeners.

The society is well supported by resident nobility and gentry, and Hardenhuish Park, lent for the purpose by E. H. Clutterbuck, Esq., makes an ideal show ground. Mr. W. Small, secretary, deserves well of his committee for the exercise of strictly business capacity and geniality of manner to all and everyone alike.

#### Tavistock, August 12th.

On Wednesday, August 12, the fifty-sixth annual exhibition of flowers, fruits, and vegetables took place in the Market Hall. The Devon Bee-keepers' Association held their annual meeting in connection with the flower show. Honey, wax, bees, appliances, &c., were on view, and a lecture on bee-keeping was given by Mr. J. Jordan, of Bristol, which was greatly appreciated. Charming displays of flowers and plants from the owners of gardens in the neighbourhood delighted the public. From Mr. F. Q. Clatworthy, gardener to Mr. F. Bradshaw, Lifton Park; from Mr. J. Quick, florist, The Library, Tavistock; and from Mr. J. Warren, Parkwood Nurseries, Tavistock. Masses of clean, well grown plants the three groups showed. A beautiful stand of plants sent by Mr. Edred Marshall, of Parkwood House (gardener, Mr. C. Chanter), completed a well arranged set of non-competing decorations. Mr. Clatworthy's foliage and flowering plants were arranged at the upper end of the hall, reaching high towards the roof. There were *Campanula pyramidalis*, *President Carnot*, *Begonia* (pink), *Diascia barbara* (a new variety, light pink), *Acalypha Sanderi*, *Lilium lancifolium*, &c.

Mr. J. Quick's stand was large and good. Here were choice Orchids, among them *Disa grandiflora* (Flower of the Gods), *Cypripedium Rothschildianum*, *Odontoglossums* in variety, *Oncidium cucullatum*, stately Palms, *Seaforthia elegans*, and *Chamærops excelsa*, &c. Books and flowers are evidently a combination in Tavistock's librarian's view. Mr. Marshall's stand showed a light and tasteful handling. *Malmaison Carnations*, *Montbretias*, *Galtonias*, *Marguerites*, *Liliums*, *Palms*, *Fuchsias*, and *Achimenes* were lovely. Mr. J. Warren occupied the whole of the lower end of the hall, whose plants were much admired.

From the Palace of the Poor—Tavistock Union Workhouse garden (Master, Mr. G. Coles)—came a highly commendable collection of vegetables. Mr. J. Pearce showed twelve varieties of Sweet Peas; Mr. Hepper, autumn Onions; and Messrs. S. Worth and T. Northcott boxes of Cactus Dahlias; while Mr. Greenfield's (mark the word) Grass bore the statement that the seeds were found buried with a skeleton in a pre-historic cist (grave) at Harlyn Bay, North Cornwall coast, and were probably 2,500 years old. After that, I think that the show can truthfully be described as the best held in Tavistock for some years. Competition in some classes was keen. Some wonderful Onions were shown by Mr. Clatworthy, Lifton Park. They ought to have gone to Taunton the following day. The attendance was larger than for four years past. The Duke of Bedford is patron of the society, and his agent, Mr. E. C. Rundle, of Deer Park, is president for the year. Mr. Rundle in many ways has greatly helped the show. Mr. G. Chapman, secretary, was a great help to all concerned in a good show.

Mr. E. Sly, of Tamerton, was first in collection (1) of vegetables; Mr. T. Paige first in collection (2) of vegetables; and Mr. R. Stanbury, of Lifton, was first in collection (3) of vegetables. Mr. F. Q. Clatworthy, in the open competition, carried off first prize in twelve varieties of Potatoes, named, eight of each sort; Mr. E. Sly came second, and Mr. Hoeking, gardener to Rev. S. Baring-Gould (a world-wide name), was third. Among the competitors were several winners who have been members of horticultural classes under the County Council. Many subjects are omitted from this report, but keen competition was experienced in Onions, Potatoes, and Peas.

Among the successful exhibitors of flowers were Messrs. Merrifield, for annuals; Brown, for Carnations; Webb, for Dahlias; H. Crossman, for Geraniums, &c. For collection of cut Roses, first, Mr. J. Southcott; second, Mr. H. Crossman. Mr. Gladstone Apple, among the fruit, took a high place, the colour and flavour being very fine. For the open collection Mr. Clatworthy was first, Mr. Hocking second, and Mr. W. H. Chichester third. Melons, first, Mr. W. Chichester; second, Mr. Clatworthy. Best ripe fruits, first, for collection, Mr. Clatworthy; second, Rev. S. Baring-Gould. Peas, fifty pods, first, Rev. S. Baring-Gould; second, Mr. W. B. Trahair; third, Mr. W. Wilmot. In honey Messrs. W. E. Brooking (Kingsbridge), J. Sheldon (Umberleigh), W. E. Brooking (11b section comb honey), E. E. Scholefield (Chudleigh), C. Squire (Morthoe, Ilfracombe), J. M. Cann (Brixham), and W. J. Cavey took first prizes. The honey was of a very superior quality, and greatly commended by the judge.—N.

### Taunton, August 13th.

Unqualified praise resounded on all hands of the extraordinary merit and extent of the thirty-sixth annual exhibition of the Taunton Society, held on the above date. The weather, too, being gloriously fine, attracted visitors in their thousands.

Trained stove and greenhouse plants made a magnificent display, the whole length of the spacious tent being filled on one side. Messrs. J. Cypher and Sons championed the class for twelve, *Stephanotis*, *Ixora Williamsi*, *Allamanda nobilis*, *Bougainvillea glabra*, *B. Sanderi*, *Ixora Pilgrimi*, *I. Duffi*, and an immense plant of *Statice intermedia* were most conspicuous specimens. Mr. W. Vause, Leamington, was a good second; Mr. Thomas, gardener to W. G. Marshall, Esq., third; and Mr. Tucker, Trowbridge, fourth. With six Messrs. Cypher were again well first; Mr. Vause second, and Mr. Rowland, gardener to W. Brock, Esq., third. These exhibitors won with eight foliage plants in the same order of names, Messrs. Cypher being distinctly ahead. Towering Palms and bright *Codiaeums* marked their fine exhibit. Messrs. Rowland and Tucker had the best Ferns. Similar classes are provided for amateurs, in which foliage and flowering plants are allowed.

In that for twelve Mr. Thomas led easily, his *Codiaeums* being much the finest in the show, *C. Warreni*, *C. Reidi*, *C. Andreanum*, and *C. Harrisoni* being especially good. The flowering plants were not so fine as the foliage, though all were excellent. Mr. Rowland came second with an even twelve, all flowering plants. *Fuchsias* were small, *Begonias* numerous and bright, *Liliums* (good) and *Caladiums* refined in plant and choice in variety, Mr. Thomas' being especially good. Single specimens, Orchids, and new and rare plants found Messrs. Cypher, Tribble, Thomas, W. H. Day, and F. Hubbard in healthy rivalry.

Groups of plants lost the service of the Messrs. Cypher, but in Mr. Vause it was at once seen that an exponent of the art of floral blending was present. A wide and lofty eork covered arch was made to carry a beautifully furnished and graceful Phoenix, beneath which were grouped small and choice Orchids and varied foliage plants, *Codiaeums*, *Coeos*, *Caladiums*, &c.; while the graceful *Humeas*, with their brown plumose sprays afforded just that quiet touch of elegance no other plant can do. A cool-looking base of moss gave a finishing touch to what was an excellent example in tropical effect. These groups are displayed in an oval 13ft by 10ft space, and are so arranged that visitors can make uninterrupted promenade among them. Mr. Rowland's group from Exeter also afforded some striking features, *Liliums*, Bamboos, Orchids, and *Codiaeums* being deftly arranged with the hand of an experienced exhibitor. Messrs. Cole and Son, Bath, were third. A smaller group for amateurs, 10ft by 8ft, also of an oval shape, found Mr. Rowland an easy winner; Mr. Kidley, gardener to Col. Sanford, being second, and H. S. Baily, Esq., Glastonbury, third.

Cut flowers appeared in the same extensive and varied character. So crowded was the available space that many exhibits could not find advantageous inspection. Roses were really grand. Messrs. Perkins, of Coventry, won in the class for thirty-six, and also that for eighteen varieties, Messrs. Townsend and Sons, Worcester, and Jarman and Co., Chard, being second respectively, Messrs. H. Corder, Bridgwater, and R. F. Hobbs, Worcester, taking the thirds. Mr. Corder won from Messrs. Townsend and Hobbs with eighteen Teas. Dahlias, like Roses, were bright, large, and good. With twelve, Messrs. Cray, Humphries, and W. Treseder, Cardiff, took the prizes. Messrs. Cray and Sons took the first card with pompon and single varieties; Mr. Humphries won with six Faneies; and Messrs. Jarman six Cactus. Phloxes, Asters, Carnations, Hollyhocks, *Begonias*, Sweet Peas, herbaceous and choice greenhouse flowers all found a large entry, high class quality, and many admirers. Names are so numerous that space forbids their record.

Decorative tables hold an important place in the Taunton schedule and show ground, and on this occasion the artistic element was present in goodly force, and it was pleasant to find the work of the judges gave but little cause for critical comment, which is so common in this now popular phase of flower

shows. A dessert table laid for eight persons with fruit and flowers found a winner in Mr. F. Lock, Crediton. He had beautiful Orchids, well arranged with Peaches, Melon, Grapes, and Nectarines as his dessert fruit. Messrs. Cole and Son won the second prize, and Mr. W. Vause third, all employing similar Orchid flowers. Mrs. Blake, Bath, won in the ladies' class for a similar table. Mrs. Hill, Bridgwater, second, and Mrs. Cooper, West Monkton, third. An extra prize and h.c. eards were given other exhibits, so numerous and good were they. Another class for floral table was quite as largely contested. Hand bouquets and vases of flowers were excellent, the prizes culled mostly by professionals, among whom were Messrs. Perkins, Cypher, Vause, W. H. Coles, Bristol, and Treseder, Cardiff.

Fruit made a grand display. Three competed for a collection of eight dishes. Mr. T. Turton, gardener to R. D. Wingfield Digby, Esq., Sherborne Castle, leading with Black Hamburgh (small in bunch), Muscat of Alexandria (also small in bunch, but well coloured), an 11lb Melon, Royal George Peaches, Nectarines (good), Brown Turkey Figs, and Apricots. Mr. G. Hall, gardener to the executors of the late Lady Louisa Ashburton, was second; but except for the Melon his dishes were decidedly stronger than the first prize lot. Col. Vivian was third. For four dishes Mr. Hall won from Mr. Mitchell, gardener to J. W. Heming, Esq., both having extra good fruit. Mr. Kidley third. With Black Hamburghs Mr. Mitchell won easily, as he also did with Muscats and any other kind of black, staging good Gros Maroe. Mr. Hall won with white, other than Muscats, with Foster's Seedling.

Mr. Cooper, gardener to W. Macadam Smith, Esq., president of the society, led with a fine dish of Peaches, and Mr. Kidley, gardener to Col. Sanford, with beautifully coloured Stanwick Elruge, won in the class for Nectarines. Apricots were good, also Pears, for the year. Plums, both light and dark coloured, were excellent; but dessert Cherries were absent. Morellos were finely shown. Apples, too, were plentiful and good; indeed, one would scarcely believe the season to be a bad one for hardy fruit, judged by the quantity shown at Taunton.

Vegetables are always presented in strong force at this Western show, and this season proved no exception to the old rule, and the cottagers' section, as is always the case, was filled with a magnificent display of every kind. Potatoes were grand, so clean, large, and shapely, and the judges must have had considerable difficulty in deciding between the merit of such closely allied qualities. In the open classes Mr. Mavis, gardener to Sir J. Shelley, Bart., Crediton, won with a grand exhibit. Mr. Kidley, also a veteran vegetable grower, was second; and Mr. H. Moore third. Potatoes in six varieties from Messrs. Wyley, Mavis, and Kidley made an admirable display, the first-named winning also with coloured kidneys and white rounds. All other vegetables, Carrots, Peas, Beans, Onions, Tomatoes, Lettuces, Marrows, and Turnips, were each severally of the highest state of perfection. Much might be written of the cottagers' array, but space forbids.

The park, which forms such an easily accessible show ground, affords an ideal spot for such an extensive show, the many tents being grouped so that promenade is made easy and pleasant. An influential and business-like committee control arrangement, which work with clockwork smoothness. The unanimous verdict from everyone seemed to re-echo in the words "Everything splendid!"—music, weather, show, and its management. Mr. Winsor is the experienced secretary, on whom the highest credit reflects.

### Leith, August 14th and 15th.

Leith Horticultural, Industrial, and Sports Society's twentieth show was held on Friday and Saturday, August 14 and 15, at the Hawkhill grounds. Three years have elapsed since the show was last held at Hawkhill, the site usually being the Victoria Park; but the committee, fully aware of the growing popularity of the show, determined to hold it at Hawkhill. Here there is ample room for the many attractions which lure the individual from city and hamlet, be he a lover of flowers, a devotee of sport, or an admirer of art. The only regrettable part is that these grounds are so difficult of access, being a considerable distance from either tram route or railway station. All round the show was one of great merit. The classes were well filled, the entries totalling 1,078, and entirely filling the large marquee, in former years containing both the flower show and industrial exhibition section. Competition was perhaps strongest in the section for plants and cut flowers, some remarkably fine specimens being staged. A class which usually excites great admiration is that for floral designs, open to florists in Edinburgh and Leith. A much admired design, which was rightly awarded first prize, was a beautiful cross and pedestal, composed mainly of dark purple Sweet Peas, the cross being relieved by white Sweet Peas and Lily of the Valley; while the pedestal made an exquisite background for a cluster of *Stephanotis*, pink Carnations, and Fern.

In all sections for tables there was exhibited a standard of excellence which would have done credit to the Waverley Market shows. In the class open to all for a table not

to exceed 12ft by 6ft, arranged to produce artistic effect, the first prize (a silver cup value £10) was easily won by Mr. Wm. Jobson, nurseryman, Portobello, with an exceedingly artistically arranged display of foliage and flowering plants, surmounted by a fine specimen of *Cocos Weddelliana*. Mr. Phillips, Granton Road Nursery, secured second place with a table which produced a good effect, but rather heavily arranged. Mr. P. Hunt, Murrayfield, was third with a bright display. In the gardeners' section, for the best arranged table of plants, there were set up some nice tables. Mr. A. Alexander, Craigend Park, Liberton, took first place, the second being awarded to Mr. P. Hunt. The amateurs' section for table of plants, 8ft by 4ft, brought forward a large number of entries, and the competition was keen. The first prize, Thos. McKie Memorial Cup (presented by Provost McKie), gold badge, and £2, being secured by W. J. Bryson, 53, East London Street; second, Isaac Black, 30, Beaverhall Terrace; third, Wm. Plinderbith; fourth, D. McPherson, 35, McDonald Road.

For twenty-four Roses, open to nurserymen, there were five entries, the first place (gold medal) being secured by D. and W. Croll, Dundee; second (silver medal), Hugh Dickson, Belfast. Twenty-four herbaceous spikes or bunches, at least twelve varieties, first (gold medal), J. Cocker and Son, Aberdeen; second (silver medal), John Downie, Murrayfield. Twenty-four Cactus Dahlias, first, Hugh Dickson, Belfast; second, John Downie, Murrayfield.

For some unknown reason the majority of the local nurserymen seem to have given this flourishing show the cold shoulder in the way of exhibits, the only one forward being a highly artistically arranged display of *Violas* and *Pansies*, Show and Fancy, from John Downie, Beechhill Nursery, Murrayfield. This was worthily awarded a silver medal. Close by, shown by the same firm, was a bunch of new *Chrysanthemum maximum* King Edward VII., the flower being of great size, and the petal of good form and substance. It is the largest type we have yet seen, and seems a decided acquisition.

Watching the crowds which flocked to this show, even in the adverse climatic conditions which prevailed on Saturday afternoon, the writer of this could not but contrast the success of the undertaking from a financial and general point of view with the poor results which are sometimes produced at our autumn show in the Waverley Market. The success of the Leith show committee might well induce any society to follow in their footsteps, for after all even the beauty and variety of the flowers may not appeal equally to all, and some other attraction in conjunction is not only desirable, but often necessary, in order to acquire success. May the energetic and genial secretary, Mr. Fairley, and his able assistants, long be able to conduct and still further popularise this successful exhibition!—EDINA.

### National Carnation and Picotee (Northern Division).

The Northern Society held its exhibition in the Royal Botanical Gardens, Manchester, on Saturday last. Pastoral plays and a fine military band were the attractions, and would undoubtedly have been a great pleasure to visitors, but unfortunately the rain came in torrents throughout the day, and the attendance was indeed a small one. J. W. Bentley, Esq., J.P., the esteemed president for the year, and Mr. Wm. Prescott, the courteous secretary, did all they could. There was a good muster of exhibitors from various parts, and many flowers of great merit.

For twelve Carnations, bizzarres, flakes, and white grounds, Mr. T. Lord, Todmorden, took the lead out of seven, with J. S. Hedderley, Geo. Melville, Master Fred, Arline, Sportsman, Mrs. T. Lord, Admiral Curzon, Gordon Lewis, Mrs. Shaw, Sarah Payne, Miss C. Grahame, and C. F. Thurston; second, Mr. J. W. Bentley, Stakehill, with Admiral Curzon, and two extra good seedlings; third, Mr. T. Etherington, Middleton Junction.

For six bizzarres and flakes, Mr. J. Edwards, Moston, had really good flowers of Pandora, J. D. Hextall, Rt. Houlgrave, Gordon Lewis, C. F. Thurston, and Sarah Payne; the second, Mr. J. Brocklehurst, Marple, with G. Melville, fine; third, W. Curbstone, Kilmarnock, and fourth, D. Walker, Kilmarnock.

The Picotee classes were admirable. Mr. C. F. Thurston, Wolverhampton, taking a distinct lead for twelve dissimilar white grounds, all in the best varieties; Mr. A. R. Brown, Birmingham, was a good second, and third, Mr. T. Lord.

For six white grounds there were ten lots, Mr. J. Edwards gaining the victory with extra choice flowers; second, Rev. C. Gottwaltz, Droitwich, and third, Mr. J. W. Bentley. The class for twelve Sells was excellent, four competing. Mr. A. R. Brown scored with heavy flowers, in which "dressing" was almost nil; second, C. F. Thurston; and third, T. Lord.

For six Sells, the Rev. C. Gottwaltz won handsomely out of eight lots; second, Mr. Curbstone, with fine Barras and Nubian; third, Mr. D. Walker.

For twelve Fancy or yellow ground Carnations or Picotees, Mr. C. F. Thurston staged magnificent flowers of Queen Bess, C. B. Thomson (2), Daniel Defoe (2), Czarina, Artisan, Argosy, &c.; second, Mr. A. R. Brown. A nice even lot were the sixes,

Mr. D. Walker winning with H. Falkland, Helios, Edith, Chas. Martel, Paladin, Gronow. There was a smart battle for single blooms. Best scarlet bizzarre, Mr. Thurston, with Rt. Houlgrave. Best crimson bizzarre, first and second, Mr. T. Lord, with Master Fred and G. S. Hedderley. Best pink and purple bizzarre, first and second, Mr. T. Lord, with T. Lord and Sarah Payne. Best scarlet flake, first and second, Mr. C. F. Thurston, with Sportsman. Best rose flake, Mr. C. F. Thurston, with Mrs. Rowen and Mr. T. Lord. Best purple flake, first, Mr. T. Lord, with Gordon Lewis.

**PICOTEES**—Best heavy edged red, first, Mr. T. Lord, with J. Smith; second and fourth, Mr. Brown, with Brunette and Beatrice. Best light edged, first and third, Mr. Thurston, with Mrs. Gorton and T. Williams. Best heavy edged purple, first and fourth, Mr. J. Edwards, with Mrs. Openshaw. Best light edged purple, first and fifth, Mr. A. R. Brown, with Pride of Leyton and Myra; second and fourth, Rev. C. Gottwaltz, same varieties. Best heavy edged rose, scarlet and salmon, first, Mr. A. R. Brown, with Mrs. Payne. Best light edged rose, scarlet or salmon, first and fifth, Mr. A. R. Brown, with Lucy; second and fourth, Mr. T. Lord, with Fortrose and Favourite.

The premier blooms were: J. B. Hextall Carnation from Mr. J. Edwards and to Myra Picotee from Mr. Brown. Certificates were awarded to Rev. C. Gottwaltz for Myra, a medium purple edge, and to Luey, a light edged scarlet Picotee. Mr. Ben Simonite gained a certificate for Aurora, a heavy edged rose Carnation.—R. P. R.

### Harborne Gooseberry Growers'.

The eighty-ninth annual show of this society was recently held at the Green Man Hotel, Harborne.

The following are a few of the chief awards:—Premier prize: Mr. E. Withers, Bobby, 20dwt 9grs. Twin berries prize: first, Mr. E. Withers, Fascination, 28dwt 17grs.

Class prizes.—Red: Mr. E. Withers, with Bobby, 20dwt 6grs. Yellow: Mr. E. Withers, Leveller, 20dwt 6grs. Green: Mr. E. Withers, Stockwell, 17dwt. White: Mr. E. Withers, Transparent, 19dwt 21grs.

Six red berries.—1, Mr. E. Withers, Bobby, 11dwt 12grs; 2, Mr. W. James, Dan's Mistake and Bobby, 93dwt 12grs.

Six yellow berries.—First, Mr. E. Withers, Leveller, 116dwt; Messrs. James and Careless next with Leveller.

Six green berries.—1, Mr. T. Careless, Shiner, 91dwt 6grs; 2, Mr. W. James, Surprise, 87dwt 18grs; 3, Mr. E. Withers, Surprise and Telegraph, 87dwt.

Six white berries.—1, Mr. E. Withers, Transparent, 98dwt; 2, Mr. A. Wise, ditto, 82dwt; 3, Mr. W. James, with Careless, 77dwt 19grs.

Special prizes were awarded to Messrs. E. Withers, T. Careless, T. Richards, W. James, and B. Smallwood, with such varieties as British Oak, Bobby, and Leveller.

In addition to the foregoing show there was held a few days previously another under the auspices of a much younger society at the Sportsman Inn, Harborne. It was not so large in extent. Prizes were also offered for Gooseberries at the recent amateurs' and cottagers' show held in connection with the Harborne Charity Sports Fête.—W. G.

### Rock Ferry.

In the classes for groups six competed, that for 64 sq. ft. being secured by Mr. G. Osborne, gardener to Dr. Cooke, Tue Brook; Mr. H. Ogden, second. For a space of 45 sq. ft., Mr. H. Morris, gardener to G. Atkin Esq., took the lead, having a good centre and highly coloured *Dracenas*, *Caladiums*, *Crotons*, &c. Dr. Cooke won for six stove and greenhouse plants.

Substantial prizes were offered in other miscellaneous plant classes, a word being due to Messrs. Roby and Lee for extra fine *Begonias*, and to Mr. C. Jones, gardener to E. Evans, Esq., Spital Old Hall, for two excellent specimen Ferns of *Nephrolepis davallioides* furcans and *Davallia fijiensis*. The principal specimen Orchid was *Cattleya Sanderiana* from Mr. S. Bell, gardener to J. U. Hodgson, Esq.

The cut flower competition was a complete success. For a collection of Carnations and Picotees six competed, and Mr. Findlow, gardener to A. J. Oakshott, Esq. led; Mr. J. Clarke, gardener to H. D. Trelawny, Esq., Shotwick Park, near Chester, second, his stand containing distinct varieties, each flower standing clear of its neighbour, and of fine form. There were some striking table decorations. Roses were fully up to the average, Mr. R. Jones, gardener to R. Kellock, Esq., being first for twelve. Herbaceous flowers alone were worth the price of admission, Messrs. J. Lee and J. Clarke winning. Indoor cut flowers from Mr. Hodgson were very choice. The display of fruit was large, Mr. Ferguson, gardener to Mrs. Paterson, coming first for six dishes. Mr. A. Crisp, gardener to M. Clover, Esq., secured Peach and Nectarine classes with Dymond and Red Roman. Grand Black Hamburgs and Madresfield Court came from Mr. J. Richards, gardener to T. B. Kendall, Esq.; Mr. Hodgson with Muscats, and Mrs. Paterson, Golden Champion. Mr. C. Irvine,

gardener to F. C. D. Castle, Esq., had good hardy fruits. Earl's Favourite from J. H. Kenion, Esq., was the premier Melon.

The vegetable class were of the highest credit, Mr. H. D. Trelawny, proving a great winner, with nine varieties, consisting of Ailsa Craig Onions, Eclipse Cauliflower, Duke of Albany Peas, Potato Snowdrop, Polegate Tomato, Sutton's Best of All Runners, Superlative Celery, Snowball Turnip, and Sutton's Model Red Carrot. Other most successful exhibitors were Mr. J. H. Clarke, T. Joynson, J. Coulthrop, and J. Lee.

In concluding, I may say that T. B. Kendall, Esq., the courteous chairman, and R. Meaker, Esq., secretary, did valuable work to make the show a success, without the absence of music or any outside attraction. The unnamng of exhibits was most annoying to the public, and in some cases to those versed in the work of reporting. Rule 4 in the schedule should on future occasions be strictly enforced.

Mr. H. Middlehurst had a handsome collection of Sweet Peas.—R. P. R.

### Sparkhill and District, August 15th.

Stormy weather was associated with the holding of the third annual summer show in connection with this enterprising society. In evidence of its increasing popularity, it may be remarked that during the past year there has been an increase of 100 in the membership, which now stands at 500. Prizes to the value of £150 were offered, with no fewer than 150 classes, and a largely increased number of entries. Much credit is due to the courteous hon. sec., Mr. Wm. W. Staples, and his efficient staff of committeemen for the arrangements throughout. Despite the unpropitious state of the weather the show was well attended, and a fair proportion of the visitors hailed from Birmingham. Sparkhill also boasts of a spring show, thus affording additional evidence of the love of horticulture permeating the district.

In the open class section prizes were offered for arrangements of miscellaneous plants, arranged to produce the best effect. Mr. G. Hancox proved to be an easy first with a tasteful arrangement, in which richly coloured Codæums (Crotons) formed the leading feature; while a cork bark covered arch at the back of the design, surmounted with an elegant Palm and otherwise tastefully adorned, helped to complete the tout ensemble of this artistic composition. The second honours fell to Councillor W. Waters, Acocks Green, for a very effective development, with Mr. S. Mason in the third position. Stove and greenhouse plants were fairly well staged by Messrs. G. Hancox and Waters. Begonias, Fuchsias, Pelargoniums, and ornamental foliage plants were also shown by various exhibitors.

Cactus Dahlias were very well staged, the winners being Messrs. M. W. Pemberton, T. Williams, and G. Ingram, in the order named. Pompon Dahlias were nicely shown by Messrs. Pemberton, W. E. Wilson, and G. Ingram, and Roses by Messrs. R. Dawes, J. W. Simcox, and G. F. Spittle. Carnations and Picotees did much credit to the successful contestants, Messrs. J. Gregg, W. Pemberton, and J. W. Smart. Sweet Peas formed a pleasing feature, and the prizetakers were Messrs. Hinton Bros., Warwick, E. Deakin, and W. Marple.

For the prizes offered by Messrs. Hallams, seed merchants, Birmingham, for nine distinct varieties of Sweet Peas, arranged with their own foliage, Gypsophila paniculata, or Fern fronds, Messrs. C. Cooke, C. Brasier, and G. Chadband were the respective winners. For nine varieties of Sweet Peas, arranged with foliage or Gypsophila, Messrs. C. Brasier, W. Marple, and W. Brasier were the successful contestants, as in order named. Mr. James Stredwick, St. Leonards-on-Sea, offered special prizes for eighteen Cactus Dahlias, the only two contestants being Miss May Edwards and Mr. W. Deakin, each with very good blooms.

Prizes were offered for dinner table decorations. In the ladies' class the first prize was awarded to Mrs. E. Pitt, and Miss Woolman, Miss A. Horton, and Miss B. Gibson were the other winners, all with tastefully arranged effects. These were open to ladies residing in the society's district, i.e., within a radius of four miles of Camp Hill Grammar School. Florists and members of nurserymen's families may compete in the above class 19; whilst in class 20, for dinner table decorations, florists' and members of nurserymen's families are excluded. The first was accorded to Miss M. E. Clarke; second, Mrs. Machin; third, Mrs. E. Bodley; fourth, Miss J. A. Tidmus; and fifth, Miss E. Matthews, for most tasteful creations; and the same remark applies to Miss M. E. Clarke, Mrs. Bodley, and Miss Guest for centre table decorations. Altogether, the foregoing exhibits formed an attractive feature of the show. Strongly shown were the various exhibits of cut flowers, but space will not allow details.

Vegetables, considering the untowardness of the season, were remarkably well shown in the major portion of the exhibits in the various classes.

Honorary awards were made to Messrs. Thomson and Co., Birmingham, for a miscellaneous collection of plants, Carnations, and Picotees (silver-gilt medal). Silver medals to Messrs. W. L. Pattison, Shrewsbury, for a fine collection of Violas; Mr. H.

Woolman for a floral arrangement; Messrs. W. H. Simpson and Sons, Birmingham, for herbaceous flowers and Sweet Peas; Councillor W. Waters, Violas; Mr. W. B. Child, hardy herbaceous flowers; Messrs. Yates and Sons, Birmingham, for cut flowers and Onions, the latter of immense size; and Mr. L. E. Lloyd for a group of plants. Bronze medals to Messrs. Hinton Bros. for Antirrhinums and border Carnations; Mr. E. Watkins for floral designs; Mr. A. H. Foster for a collection of plants and vegetables. Certificates of Merit to Messrs. Webb and Sons, Wordsley, for a collection of Sweet Peas; Mr. G. Walker a group of Begonias; Mr. W. T. Price for a collection of plants; Mr. G. Andrews, a table decoration; and to Mr. G. F. Spittle, a collection of border Carnations (seedlings). Garden allotment prizes were keenly contested for; also for best kept gardens.

### Cardiff Gardeners'.

The annual outing of members took place on Monday, August 10, when the party, numbering nearly fifty, journeyed to The Hendre, Monmouth, the beautiful residence of the Rt. Hon. Lord Llangattock. Leaving Cardiff in saloon carriages at 9.30 a.m., they reached Abergavenny at 11.10, where the members proceeded to the Swan Hotel, and a splendid dinner was served at 12 o'clock by the host (Mr. P. Lloyd). Mr. F. G. Treseder, F.R.H.S., N.D.S., occupied the chair. The toast list was of a very brief nature, owing to a limited time. The chairman moved "The King and Royal Family." Mr. H. R. Farmer moved the next toast, that of "The President" (J. Lynn Thomas, Esq., C.B., F.R.C.S., J.P.). Owing to the unavoidable absence of that gentleman, Mr. Thomas Malpass, head gardener to that gentleman, responded. "The Cardiff Gardeners' Association" was proposed by Mr. C. Phelps and responded to by Messrs. H. R. Farmer, Thos. Malpass, and John Julian. Mr. T. Clark proposed "The Visitors," and Mr. Roddy responded. "The Chairman" was proposed by Mr. W. J. Prosser and responded to by Mr. F. G. Treseder.

After the party was photographed they proceeded in brakes to The Hendre, which was reached after a little over two hours' drive through the beautiful and picturesque valley of the Usk. Mr. Thos. Coomber, F.R.H.S., met the members at the entrance and conducted them over his charge, where, as usual, everything looked spick and span and in perfect order. Fruits under glass, viz., Grapes, Melons, Peaches, Nectarines, Figs, and Tomatoes, were a prime and useful lot for the supply of the mansion.

Coming to the outside crops, Gooseberries and Currants were in abundance, but, as Mr. Coomber had told many of the members previously at our late show (where he acted in the capacity of a fruit judge), he had no Apples nor Pears, and true it appeared that he must have suffered very severely by the disastrous hailstorms during the spring, when the trees were in blossom. The lawns and rockeries looked remarkably well, which reflected great credit on the management. Great interest was centred upon the two trees recently planted by T.R.H. the Duke and Duchess of York (now Prince and Princess of Wales). By special request the members were photographed in front of the mansion.

Here Mr. Coomber introduced the party to the housekeeper, who very courteously showed them the various rooms, conspicuous for the beautiful carving work and other works of art, besides many curios rich and rare. Tea (which was very generously provided by His Lordship) was served and thoroughly appreciated, after a delightful ramble amid bracing air. Mr. H. R. Farmer moved a very hearty vote of thanks to the Rt. Hon. Lord Llangattock, spoke at some length of his generosity and hospitality. Mr. Malpass seconded in a few well-chosen words. In the absence of His Lordship, Mr. Coomber very ably responded, and spoke in eulogistic terms of his employer's good points.

Mr. J. J. Graham moved a very hearty vote of thanks to Mr. Coomber, to whom, he said, the members felt deeply indebted, inasmuch as he had done all that was possible to make the day what it was—a happy one. Mr. R. Mayne seconded. Mr. Coomber briefly thanked the members for the kind thoughts they had for him. The brakes were now ready to convey the members back to Abergavenny, thence to the station. Cardiff was reached at ten p.m. The party unanimously thanked the Hon. Secretary, who had charge of the arrangements, adding that everyone had most thoroughly enjoyed themselves.—J. JULIAN.

Bell and Sons, Covent Garden.

### Hardy Fruit Garden.

**PEACHES AND NECTARINES.**—The midseason varieties are now attaining full size, and the fruits commencing to colour. They must have the benefit of full exposure to light and sunshine, with free access of air among the branches and shoots. To attain this end the growths ought to be carefully laid in, and leaves shading the fruits drawn on one side. As far as possible cut out all superfluous shoots—that is, weakly or ill-placed growths which will be of no use to train in as future bearing shoots. Crowding is detrimental to the fruit, and a great means of preventing the wood ripening as it ought. Further attention must be paid to this when the fruit has been gathered by removing the bearing shoots. Affix nets below the fruit when ripening to prevent the best samples from falling and becoming bruised. Give liquid manure, and a mulching to the late varieties, disposing the shoots thinly, and admitting light to the fruit.

Young trees not yet in bearing must have the branches and shoots disposed so as to well balance the growth. In addition to the removal of weakly shoots, the strong and rampant must be prevented taking too much lead. Cut out all that cannot readily be laid in and prove serviceable. The first opportunity should be taken as soon as trees are clear of fruit to give a thorough syringing. If comparatively clean, clear water only may be used, but infestations of insects require the applications of insecticide.

**GOOSEBERRIES.**—Free grown bushes ought to be looked over as soon as the fruit has been cleared from them, reducing the crowded interior, and thinning out generally, in order that the ripening of the wood may be facilitated. Cut back the side shoots of cordons on walls or fences if not previously done, leaving three pairs of leaves. After the continued moist weather weeds have grown rankly among fruit bushes, and need prompt removal.

**CURRANTS.**—The side shoots on the main branches of Red and White Currants are better for being shortened back to a few leaves, as it will help the basal buds, which will produce the fruit to develop. Black Currants may undergo the process of thinning, merely cutting out the old bearing shoots, weakly, crowded, and interlacing branches, and regulating the remainder.

**GATHERING EARLY APPLES AND PEARS.**—Some of the small early varieties of Apples, including Irish Peach, American Mother, and Mr. Gladstone, may be gathered and eaten direct from the trees on becoming ready to pick. As a rule, Pears ought not to be left on the trees to fully ripen, but gather them when they part readily from the spurs. Spread the fruits out thinly in a box or drawer for a few days when they will be ready for use. Summer Doyenné, Jargonelle, Williams' Bon Chrétien, Citron des Carmes, and Beurré Superfin are good early varieties.

**OUTDOOR VINES.**—Liberal treatment must be given to ensure the Grapes swelling to their full size, and finishing off with good colour and quality. A free but not crowded growth of laterals may be permitted, keeping them from unduly extending by judicious shortening. Admit plenty of light to white Grapes, black varieties needing more shade to ripen properly. It is assumed that the berries in the bunches have been properly thinned out, and the bunches reduced to a fair number. A mulching of manure over the roots will be appreciated by the Vines, especially should hot, drying weather prevail. Water and liquid manure may be given freely over the mulching.

**AUTUMN PRUNING FRUIT TREES.**—If there is an opportunity of relieving trees overburdened with crowded wood, the first opportunity may be taken to carry out the work, not waiting until winter, the usual time for pruning and thinning. The present time offers facilities for judging to what extent thinning out is necessary better than winter when the trees are bare of foliage. Trees on which fruit is hanging cannot be dealt with until it is removed, but others which may have had an indifferent, or no crop, are ready for examination. In the case of standard and free growing trees generally much crowded wood and spray in the interior parts of the trees should be removed first. Follow next with the principal branches, carefully effecting the removal of all that do not stand clear, but press into others. When light is excluded fruitful buds cannot form at the base of shoots which make strong efforts to reach the light, and therefore bear only at the extremities. Restricted trees, too, if allowed to retain too many branches or cordons must necessarily have elongated spurs which are usually crowded and unfruitful. It is advisable to thin out these branches to a distance not less than a foot apart, also to shorten the spurs, and thin them out. Whole clusters may be removed, sometimes with advantage.—EAST KENT.

### Fruit Forcing.

**CUCUMBERS.**—Old plants bearing from an early part of the season produce fruit about this time with "knobby" ends. These are capital for seed, but they are poor for use. To keep the plants producing straight fruits, old growths should be cut out, and young encouraged. Train this thinly, removing old leaves to make room for new, and stopping at one joint beyond the fruit. The surface soil should be removed, and fresh lumpy loam supplied. Plants in frames may be restored to vigour by a free thinning out of the shoots, supplying fresh loam in lumpy state, and laying a few of the most promising growths at a joint, giving a moderate watering and a sprinkling over the foliage on bright afternoons, closing at about 3 p.m. The autumn fruiting plants must be encouraged to make a strong growth by earthing betimes, applying enough soil each time to cover the protruding roots, and taking care to have the soil moist and warm. Supply water to the roots only when wanted, and give a thorough supply each time. Syringe at 3 p.m., damping in the morning, at noon, and in the evening in bright weather. Maintain a night temperature of 65deg to 70deg, 70deg to 75deg by day, artificially, 80deg to 90deg from sun heat, and close so as to retain 90deg, 95deg, or even 100deg.

**MELONS.**—In the case of the latest plants the leading shoot should not be stopped until it reaches two-thirds across the trellis, rubbing off the laterals up to the lowest wire, and then every alternate one on opposite sides of the primary. Maintain a temperature of 65deg to 70deg at night, 70deg to 75deg by day, 80deg to 90deg with sun heat, closing early so as to run up to 90deg or even 100deg. Stopping the laterals should not be practised unless the plants are weak, and they do not show fruit at the second or third joint. Weakly plants should have the first shows of fruits removed. Early ventilation and plenty of light are essential.

The last plants in pits and frames are swelling the fruit freely. Earth the roots if necessary, but late plants on manure-heated beds do not require much soil. Close early, affording the needful supplies of water, not allowing the laterals to interfere in any way with the principal leaves. If the weather be dull, afford good linings, and admit a little air, as nothing is so fatal to quality in the fruit as a close atmosphere. Practise sprinkling only in fine afternoons. Gradually withhold water at the roots, and moisture in the atmosphere from plants ripening fruit.

### PEACHES AND NECTARINES: EARLY FORCED TREES.

—The leaves will soon be off, but there must not be any attempt to forcibly remove them. When leafless, loosen the trees from the trellis, cleanse the house, attending to needful repairs, and painting the woodwork and trellis. Whatever pruning is necessary should be done as soon as the house is put in order. Dress the trees with an insecticide. In applying insecticides take care to reach every part, and use the brush in such a manner as not to disturb the buds. Trees cleansed and neatly secured to the trellis, look and are better than those left untrimmed until the latest period before starting. Remove the mulching and loose surface soil, giving fresh loam with an admixture of a fifth part of thoroughly decayed manure.

### PLANTING OR LIFTING TREES FOR EARLY FORCING.

—Where new houses or fresh trees have to be inserted, and fruit is wanted at an early period, the trees should be planted at as early a time as consistent with safety. The most suitable trees are those that have been trained three or four years under glass or on walls, and have been lifted annually or biennially. Those against walls, if intended for moving, to be started early, might now, especially if there is any tendency to a late growth, or any doubt as to the maturity of the wood and buds, have the soil taken out as deeply as the roots, one-third the distance from the stem that the trees extend, letting the trench remain open for a fortnight or three weeks, when it may be refilled, but do not allow the trees to suffer from insufficient supplies of water whilst the trench is open. This will effectually check the growth and insure its ripening, whilst it will materially assist lifting the trees with a mass of fibrous roots. Plant the trees for early forcing by the end of September.

**LIFTING EARLY FORCED TREES** should commence as soon as the leaves give indication of falling. Soil and drainage materials ought to be in readiness, so that the work can be performed with dispatch. The mould may consist of any good loam, preferably rather strong and calcareous. Any deficiency of calcareous substances may be overcome by an addition of chalk to sandy soil, and of old mortar rubbish to heavy soil. New borders must have efficient drainage, the bottom of the border being concreted if the strata beneath be unfavourable, or, better, laid with bricks on flat run in cement, the border being enclosed with walls so as to confine the roots, but it must have 3in. drain, with proper fall and outlet, the bottom of the border, whether concrete or cement, falling to the drains. A border one-third the width of the trellis will be sufficient in first instance, and need not at any time exceed the width of the trellis. The best varieties for very early forcing are Early Louise, Stirling Castle, or Royal George Peaches; Cardinal, Early Rivers or Stanwick Elruge Nectarines.

**SUCCESSION HOUSES.**—When the fruit is gathered cut out all the bearing wood of this season unless forming extensions, and the shoots for next year's fruiting where too crowded should be thinned to admit light and air. Supply water to the roots so as to keep the soil in a moist condition. Weakly trees will be benefited by the application of liquid manure. Ventilate the house fully day and night.

**LATE HOUSES.**—Let the fruit have full exposure to the light, drawing the leaves aside, and raising depending fruit with its apex to the light or sun by placing laths crosswise of the trellis. Keep the growths tied as they advance in length. Laterals should be kept pinched to one leaf, but in the case of trees carrying heavy crops they may be allowed moderate extension. Continue syringing on fine days in the morning and afternoon until the fruit commences ripening. Provide a little ventilation constantly, and increase it early in the day. See that the borders inside and outside have sufficient water. A light mulching of short, lumpy manure will tend to keep the soil moist. —ST. ALBANS.

## THE BEE-KEEPER.

### The Wax Moth.

The classification of this insect is at present somewhat unsatisfactory, but there is no doubt that it is embraced by the *Heterocera* group, one of the two sub-divisions of the *Lepidoptera*. The female is provided with a long ovipositor similar to that of most of the *Microlepidoptera*. The larvæ live upon the wax of which the comb is made, and generally exhibit a preference for the bases of the cells or the midriff of the comb, through which in the course of their development they gnaw long passages until the combs fall to pieces and are rendered useless. This tunnel is a sort of protection to the larvæ, as it enables them to move through it with great rapidity, consequently the bees seldom capture it, as in addition to the uncertainty of the position of the larvæ the feet of the bees often become entangled in the fibres of which the channel is composed. Straw skeps lend themselves to the deposition of eggs and production of these insects. The eggs are laid between the hive and the floor board, and immediately it hatches the larvæ feed upon the loose particles of wax found on the floor boards. The long ovipositor also enables the moth to place the eggs in almost any crevice, where it is impossible for the bees to remove them.

"It is curious," says Huber, "to observe how the artful moth know how to profit to the disadvantage of the bees which require much light for seeing objects, and the precaution taken by the latter in reconnoitring and expelling so dangerous an enemy." They contrive to glide unperceived between the sentinels and gain a lodgment in the hive, and when admission has been gained they deposit their eggs in out of the way places. After hatching, which takes place in a few days, they are enclosed in a case of white silky texture, at first like a mere thread, but gradually increasing in size. The larvæ feeds upon the surrounding cells of wax, and during its growth it insinuates itself further along the comb until it is almost eaten away. Immediately the larvæ leaves the pupa stage it becomes a winged moth, therefore in killing it all such comb should be cut out and burned, even if apparently free from moth. This destroys the moth in all its stages.

Not only are these insects a pest to the bee-keeper by spoiling his combs, but they are also enemies to the bees. Their prevalence in a hive indicates weakness of the stock, and as prevention is better than cure a sure remedy is to keep strong colonies. Ligurian bees are also either good protectors or exterminators, as it is a singular fact that they are seldom if ever troubled by them.

Wax moth in all its stages, however, should be destroyed at sight, and where they have obtained a foothold many may be killed in the evening around the hive, where they will be seen hovering about. Clean floorboards, by affording no harbour for them, reduce their chances of existence to a minimum. As a rule, the ravages of the wax moth are confined to spare combs, and the damage is only ascertained in the spring on unpacking supers when they are found tunnelled and broken down, and sometimes are one mass of excrement, which the inexperienced sometimes put down to mice. This is usually the case when left unprotected.

It has been stated that the larvæ cannot exist without moisture, therefore if surplus combs are stored in a dry, airy room they will escape the pest. The time when eggs are laid in supers is between the time of removal from the hive and wrapping up for winter storage. After being cleaned up by the bees the supers should at once be wrapped in two sheets of newspaper without holes, and tied securely. The printers' ink on the newspaper is anti-moth, and if the packing is done as soon as removed from the hive there is little probability of any eggs being laid in them. This method of keeping combs through the winter is always successful. All pieces of old combs scattered

about the apiary should be collected and melted up, and not left lying about. Floorboards should also be scraped at least once during the year. This will do much to prevent the evil.

Where moths have taken possession they must be sought out and destroyed by probing and scraping, afterwards burning all the scrapings and refuse. By this means every vestige of them is destroyed. Facilities for the production of the wax moth are offered by skeps, which, prior to packing for winter, should be examined minutely, and all worms destroyed.—E. E., Sandbach.

\* \* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, Mitre Court Chambers, Fleet Street, London, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**PHOTOGRAPHS RECEIVED (Hortus).**—Yes, received, with thanks.

**ROCK MELONS (H. K.).**—Rock and Cantaloup varieties may be successfully cultivated in a house or pit with a bottom heat of 70deg, rising gradually to 80deg. Treat as per our notes under "Work for the Week."

**AVERAGE PRICE PER FOOT OF OAK, BIRCH, CHESTNUT, LARCH, AND SCOTCH FIR (F. A.).**—The price varies according to locality. Oak is about 2s. per foot. Birch, in large trees, runs about same price or even higher, small trees being scarcely saleable, or not more than 10d. per foot, cabinet-makers being very fastidious as to grain, and only notice the finest examples. Horse Chestnut seldom brings more than 5d., and is hardly saleable, but Spanish Chestnut commands as good a price as Oak, or even more per foot, namely 2s. Larch is worth about 10d. per foot, and Scots Fir difficult to rid at 4½d. Such are the prices given an estate agent as those of several large estates over which he has command of timber sales. As economic trees, Oak, Sycamore, and Ash hold first rank amongst hardwoods, while the softwoods are in some cases scarcely riddable at any price, particularly Scotch Fir.

**HARDINESS OF SPARTIUM JUNCEUM (A. T.).**—The Spanish Broom (*Spartium junceum*) is quite hardy, and has been used with the greatest success all along the coast, and found an excellent subject for cold, draughty positions. This applies to the seaside, inland being very different, it often, in the northern parts of the country, having its young growth severely cut by keen frosts during a hard winter; indeed, this occurs in the southern parts of England in rich soil and moist positions. Hence it is good practice to cut over the plants each year, shortening or spurring them in the spring, thus securing good growth and bloom each season. We do not think it would be likely to succeed from seeds if sown on poor parts of Arthur's Seat, Edinburgh, as the position is subject to strong, keen winds! Seedlings, however, have a vigorous habit and great adaptability to circumstances. Why not try and ascertain by experience?

**AVERAGE PRICE PER YARD FOR BARBED WIRE FENCING? WHAT THE COST OF ERECTION? (Landsman).**

—The price per yard varies with the height and number of wires, also number of standards and droppers. Three and a half feet high 3-barb wires, standards 20ft apart, without intermediate droppers, 9d. per yard; with one intermediate dropper, 10d. per yard; with two intermediate droppers, 11d. per yard. Four feet high, 4-barb wires, 10½d., 11½d., 1s. 0½d. per yard; 4½ft high 5-barb wires, 11½d., 1s. 0½d., 1s. 1½d. per yard; 4½ft 6-barb wires, 1s. 1d., 1s. 2½d., and 1s. 3d. per yard; 5ft high 6-barb wires, 1s. 2d., 1s. 3½d., and 1s. 5d. per yard. These are for standards 20ft apart in each case, without intermediate droppers, with one intermediate dropper, and with two intermediate droppers respectively. The standards are of angle iron, go 18in into the ground for fences up to 4ft high, and 21 inches for the 4½ft and 5ft fences. Wind-ing pillars are not included in the prices, they requiring to be placed every 150 yards apart. Prices for straining pillars, for fences 3½ft and 4ft above ground, £1 12s. 6d. each; for 4½ft and 5ft, £1 15s. Barbed gates with match fences, £1 8s. each. The cost of erection varies according to locality and distance from place of supply, so that no estimate can be given other than by the suppliers, who gladly state particulars on application, and varies also with fence, and may range from 1½d. to 6d., according to circumstances.

**BOOK DEALING WITH COMPENSATION (Landlord).—**Secure the book entitled "Landlord and Tenant," price 1s., from W. Clowes and Son, Ltd., 7, Fleet Street, London.

**BACK COPY (1889) OF THIS JOURNAL (G. B.).—**We are sorry to inform you that no copies exist back so far. The report you refer to is in our issue of November 28, 1889, and any one of your acquaintances with a bound volume of that date may lend it to you.

**NAMES OF PLANTS.—***Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number.* (Hortus).—1. the Cypress Spurge (*Euphorbia cyparissias*); 2. *Potentilla* sp.; 3. *Spiraea albiflora*; 4. *Erica vagans*, or Cornish Heath; 5. *Erica vulgaris aurea*; 6 and 7, next week. (F. T.).—1. *Cobæa scandens*; 2. *Cissus* (or *Vitis*) *discolor*. (J. J. B.).—1. the Abele or White Poplar (*Populus alba*); 2. the Tulip Tree (*Liriodendron tulipifera*); 3. *Acer platanoides* *Schwedleri*, a most telling subject in the landscape; 4. *Acer Negundo variegata*. (M. A.).—The yellow Water Lily (*Nuphar lutea*).

## Trade Notes.

The attention of readers might be drawn to Messrs. Barr and Sons' new Daffodil catalogue for this season, and to their collections of new varieties for 1903 on pages 11 to 14. The beautiful new hybrids are the result of many years of labour in cross hybridising, and are great advances in the Daffodil family. Peter Barr is the largest and purest white trumpet Daffodil yet raised. On pages 3 and 4 are given valuable practical hints to amateurs on the cultivation of the Daffodil, which should be read by all growers of this favourite spring flower.

### Sutton's Bulb Catalogue.

Sutton's list of bulbs is always an extremely attractive publication, and this year's edition opens with a most interesting article on the value of bulbs for the decoration of halls, corridors, rooms and glass structures during the winter months. Colour schemes are also described for producing magnificent harmonies and contrasts with various classes of flowers. Some of the numerous illustrations afford excellent examples of successful grouping for the adornment of homes; others show effective contrasts in the treatment of beds and borders. The work is admirably printed, and it is bound in an artistic cover, and produced in the highest style of lithography.

## Fifty Years of Agricultural Wages.

We have a great respect for officially compiled figures. The lapses of memory are many, and often it is only facts of great interest that stand out alone and clear. With regard to the "good old times" of our forefathers we suffer many delusions. Those "good old times," could they return, would most woefully disappoint us. That they had their excellencies there is no doubt; but to many folks the days of long ago will recall only privations, and those of a most painful sort. Shall we be wrong when we aver that an empty stomach may be classed among the sharpest of trials; and, next to that, an empty mind? Then there have always been some who, soaring above the squalor of daily life, found time and means to satisfy the mind, and to become lights that lighten the many.

Mr. Wilson Fox has been preparing an analysis of the rise and fall of agricultural wages during the last fifty years. A glance at these statistics is not only interesting, but most instructive. There have been slight fluctuations since 1850, but the rise in wages has been steadily maintained and, at the same time, the fall in the prices of goods and clothes has also been steady; thus it is that the purchasing powers of £1 (sovereign) are greater now than they were in 1850. And yet, in the face of this, there are foolish people who delight in exciting the evil passions of the ignorant with the parrot cry of "the dear loaf." There is not such a thing, thank God! nor has there been for many a year.

It is pitiful to read of the low rate of wages in the early fifties, when the average weekly earnings of the farm labourer would reach less than 10s. We believe that in the northern counties they never were at that figure. The north has always led the way with regard to good wages, partly because north country agriculturists were, from their superior methods, better able to pay a sound wage, and partly because of the existence of other industries (coal and iron), which caused a healthy competition. Where money circulates money sticks. The money must be somewhere about if folk are to get hold of it. We don't want to appear to disparage the southern workman, but the north country man is better physically and mentally. This is in a great

measure the result of generations of better feeding and better education, combined with much natural shrewdness and acumen. He is a quicker worker, a more adaptive man, rather inclined to value himself highly. There is nothing like having a good opinion of oneself. If you mean to get on have a good opinion of yourself, and make your work such as will justify that good opinion in the eyes of your employer.

In our own limited experience we have known so many cases where an employer going south found it absolutely impossible to get his work done either as quickly or as well by the southern labourer, as by the men he had left behind. His only way out of the difficulty has been to import some of his old labourers and by degrees to train the new men, with better methods. We soon find out a Scotchman by his accent, but the accent of a northern labourer is not so pronounced, and therefore his presence is not so quickly detected.

The high price of corn during the Crimean war caused a corresponding rise in wages—the old standard, with modifications, was a day's wage = stone of flour, and the upward movement was maintained and intensified during the Franco-German war. Then came our Civil War, if we may speak of it as such, where Joseph Arch was the labour leader against the landowners and farmers. This kept wages high until 1879, when prices went tumbling down and crops were ruined by a wet, cold summer, and a harvest untowardly late. The farmers were hard hit, and the labourer, through them, was hit too.

In 1889 things looked a little brighter, and wages rose again, and so far have kept at a steady figure, not because the farmer can afford it, but simply because labour is scarce and he is obliged to have men at any price, as, spite of all labour-saving appliances, there is still work that the genus homo alone can do. The wages now average 17s. to 18s. per week, and a good man need never be out of employment.

The usual system with the married men is engagement by the year, and the wage is paid without deductions for wet days or ordinary sickness. This means a great deal, as we have found to our cost once or twice, when we have had a man laid up for so long a period as three months. The advantage to the farmer lies in securing efficient workers all the year round, and he is not dependent on the casual and often very unsatisfactory workman. It is the custom to hire young unmarried men also by the year, and to board them in the house of the foreman hind, or farm bailiff, as he is called, according to the neighbourhood in which he is found. These lads are well fed, well housed, and, above all, well paid, and if they ever have a chance of saving, and they should save, it is at this period of their lives. We have only been speaking now of the rank and file of agricultural labourers; not the head craftsmen, as we may term the bailiff, shepherd, or herdsman. These men, by reason of their office, receive much better pay; indeed, it is a question not so much of money as of men. A bailiff or foreman has the difficult task of making all under him work in unison. He often has a voice in the choice of men, and he it is who under the master plans out the day's work, with the view of doing the most necessary thing first, and to take advantage of every exigency of weather. As to a shepherd where a high-class breeding stock is kept, his wages would make many a man green with envy; indeed, the worthy flock is not put off with an attendant of much less rank than a Nestor metaphorically speaking—a man of special training and great experience. We have often heard it stated that So-and-So would never make the prices he does for his sheep were it not for Thomas, or Robert, or William, as the case may be. Naturally, their office is no sinecure, and they fully earn their handsome wage. The same applies also to those men whose masters own pedigree cattle, or who "go in" for the best shire blood. Once a farmer gets hold of the right man he is a fixture; that is, if money will keep him.

We have before us while we write extracts from a farmer's wage-book, both in N. Yorkshire and Durham. In 1851 the weekly wage of a yearly man averaged £30 per annum; in 1901 it had risen to £43 in Yorkshire. In Durham the wages of 1851 was a trifle higher, i.e., £31 per annum; in 1901, £55. In both cases cottage and garden free, with potatoes and coal, and in many instances milk.

The labourer of to-day makes a complaint as to extra expense in the clothing of children for school attendance. True, he has this to do, but at the same time he has no school fee, and clothing of all sorts is marvellously cheap, and the average number of the children per family is very much less.

We were surprised the other day when we reckoned up the small number of children to be found in one half of a large agricultural village. We fancy it may be that so many of the young married folks go off to the large centres, leaving the village for the middle-aged, whose families are grown up. We seldom hear of families now whose numbers run into two figures. We have a neighbour, a hard-working woman, who was one of eighteen, and the greater part of these eighteen attained man's estate; but, as the woman says, she and her brothers and sisters knew the sharp pangs of constant hunger, though their father was never out of work, and their mother added to the family treasury by taking in washing. This family are rather above the average in size and breadth, and so, evidently, unpleasant though the semi-starvation was in their youth, it has not certainly tended to dwarf them in after life. This may be because as soon as a master or mistress could be found the children were sent off to some farm-house where there was at least rough plenty, and fresh air in abundance.

We do not like to think of the children of hard-working parents as under-fed, but now, with best flour at 1s. 3d. per stone, that, at least, can never occur. Flour at 1s. 3d. per stone, as against 7s. per stone early in the nineteenth century!—3 stones for £1 1s. ! How did the poor live? Of course, white bread was an unknown luxury, and now bread and cakes and pies of "superfine" find their way to every table in the country. Foreign commodities are in every village shop, and find a ready sale. We mean here not the simple tea, sugar, and spices, but meats, fish, choice fruits of every variety; so that the workman's food is not only good, but also varies.

There is in some neighbourhoods an outcry for more milk; yet in villages where every encouragement for cow-keeping is given, the men are very apathetic on the matter. What they would like is that the master should keep cows, and supply them at wholesale prices. But the master is more inclined to sell by the gallon than by the pint, and get his money in the lump sum; or, if he does not do that, he prefers to butter or cheese what he can spare after supplying his own wants. He, too, is quite as anxious as the labourer to lessen work, and his money difficulties are far more acute.

### Work on the Home Farm.

Grain crops are ripening rapidly under the influence of sunshine and wind, and a gale the other day frightened us somewhat, for the Standwell and Goldthorpe Barleys were almost forward enough to be in danger of necking. No harm was done except to a few early Oats, and that only slight.

Wheat is very well developed in the berry, and will not stand to be very ripe without risk. Nothing is gained by letting it stand so long, and it may be cut when convenient. One rule we have always followed in deciding as to the fitness of Wheat for reaping, viz., to wait until the most backward ears could be rubbed out or threshed between the hands without bruising any of the grains. Another plan is to cut when no milky liquid can be squeezed from any of the grains.

Before the new weak-necked Barleys were introduced it was an agricultural axiom that Barley must not be cut before it is fully ripe. These Barleys must be cut much greener to save them from necking in a gale, but Chevalier and its kindred are still better left to be quite hard in the grain. We often see Oats cut too green. Farmers see a grain or two missing from the top of an ear, and hurry up at once with the reaper. The loss of a few grains must be submitted to if we are to allow the much more numerous grains lower down a chance to fill properly. How many samples of Oats are spoilt by containing thin, half-ripened grains. The corn factor reminds us when we have not given our Oats time enough to mature, but the seconds bag at the threshing machine tail would tell us more if it could speak. Well, we are ready when the corn is.

Turnip cleaning is just finished, and the horse hoes are going over them once more. We are also skerrying the Mangolds; there is not much room between the rows, but there are a few big weeds. They should have been killed before, as an old neighbour of ours says a small boy is more easily knocked down than a grown man.

Late Potatoes look almost too well, the haulm is immense, but very little progress has been made underground. British Queens are a fine crop, and should prove remunerative.

Sheep are doing well; the fine weather is grand for the lambs, which have quite recovered from the loss of their mother's milk. We saw a lot unweaned the other day—it is bad for the ewes, and no advantage to the lambs.

A good deal of orchard fruit is grown about here. The crop is an utter failure, there being no Plums or Pears, and very few Apples. It will be a very bad year for the small farmer in consequence.

ESTABLISHED 1832.

## STRAWBERRY PLANTS

### H. CANNELL & SONS

Beg to announce their New List, also **BULBS**, (sent free) of just the cream of the many varieties now cultivated. Apparently there never was a better season, for our runner plants are exceptionally fine (30,000), layered in pots, and any quantity of ordinary runners. Our neighbourhood is well known as the home for these and all other hardy fruits, and our cultural directions always lead to success.

### SWANLEY, KENT.

1,500,000	BULBS.
Spanish Iris, Yellow, White, and Blue	76 per 1000.
Crocus, all colors	5 per 1000.
Sir Watkin Narcissus	5 per 100.
Horsefieldii	5 per 100.
Trumpet Narcissus	76 per 1000.
Glory of Leiden Narcissus	6d. each.
Madam de Graaff	3 each.
Sweet Scented Pheasant Eye	
Narcissus	5 & 76 per 1000.
Mixed Narcissus	5 per 1000.
Double Daffodils	5 & 15 per 1000.
Tulips, Mixed (choice)	2 per 100.
Single Lent Lilies	36 per 1000.
Snowdrops	5 & 76 per 1000.
Strawberry Plants	1 per 100.

**H**EATING APPARATUS for Greenhouses and other Buildings. Catalogue free of all kinds of Hot-water Pipes, Wrought and Cast Iron Boilers, Radiators, Cisterns, Pumps, Baths, &c.—JONES & ATTWOOD Stourbridge.

**V**INE CULTURE UNDER GLASS.—By J. R. PEARSON. Price 1/- post free, 1/1 Office: 12, MITRE COURT CHAMBERS, FLEET STREET E.C.

**P**URE WOOD CHARCOAL, Specially Prepared for Horticultural use. Extract from the *Journal of Horticulture*: "Charcoal is invaluable as a manurial agent; each little piece is a pantry full of the good things of this life. There is no cultivated plant which is not benefited by having Charcoal applied to the soil in which it is rooted. Apply for Pamphlet and prices to the Manufacturers—HIRST, BROOKE & HIRST, Ltd., Leeds.

## Journal of Horticulture.

THURSDAY, AUGUST 27, 1903.

### Action.

T has been said that every true gardener is "a bit of a philosopher," and it cannot, I think, be doubted that the comparative solitude in which many spend their lives is conducive to thought; but whether that thought is directed toward solving the problems which crop up in connection with the daily work, or toward reasoning as to cause and effect in things in general, depends greatly upon the individual, yet each, though possessing a distinctly different turn of mind, may be a true gardener.

A certain degree of thoughtfulness is undoubtedly absolutely necessary to the young man who wishes to become a successful gardener, but it is certainly not essential that it should run in the deep groove which tends to make the philosopher, who weighs everything in the balance, and investigates again and again before becoming sufficiently convinced to put what may prove a valuable idea into practice. Life is too short for the gardener to be his own philosopher, and the man who attempts to do it only dreams away valuable time, while the practical individual who combines thought with action forges ahead. The great desideratum to-day in almost any walk of life seems to be intelligent action.

Throughout all the ages which have rolled away since the dawn of human life upon this planet, there never was a time when so many great and trained intellects were devoting their energies to the unravelling of the mysteries which surround us in every walk of life, and in the application of science to horticulture and agriculture great strides have been made during the last five years. What at the present time is more necessary than anything else in connection with gardening is that we should each keep up-to-date in regard to the discoveries

**R**EADERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

which are being constantly made, and as far as possible regulate our practice by such advanced knowledge.

Some men are naturally of such a practical turn of mind as to have the knack of making the fullest use of every atom of knowledge they do possess, while others are studious and thoughtful, but are not "men of action" in that sense which causes them to gain knowledge only for the purpose of putting it into action. Most of us have heard of the ancient gardener who was a great authority on all matters connected with his calling, especially in regard to Grape growing. His employer was one day visiting a neighbouring place where the gardener was quite a humble individual, but grew grand Grapes. The employer in question was so struck with their superiority over those grown in his own establishment that he engaged the modest Grape grower, and dispensed with the services of the "great authority."

The vital point to bear in mind is that with the majority of employers a gardener is judged by the results he achieves. They require plenty of flowers, fruit, and vegetables throughout the year, and like the gardens kept in as fine a condition as the resources at command will allow, and the man who succeeds the best under the circumstances is held in the highest esteem. When there has been no cutting down of labour and other expenses this method of estimating the capabilities of a gardener is, of course, perfectly fair, but unfortunately sometimes a man is expected to do as well as his predecessor when great reductions have been made. And this is where a great deal of unfairness comes in. In either case, however, the man who possesses a temperament in which thought and action are well balanced, will invariably succeed better than one in whom either quality predominates at the expense of the other.

Now that so many schools of horticulture have been started, and so many opportunities exist for all to obtain instruction in the theory of gardening, it is quite possible for the young to overlook the necessity for action—constant endeavour—in practical work; and although I have always been a consistent advocate for scientific knowledge in connection with gardening, yet I also know full well that the highest honours obtained in theory will bring the winner but little success along the thorny path of practice, which leads to posts of responsibility, unless the successful student has also that untiring energy that makes constant activity a pleasure. To the man, and perhaps woman too, who studies closely to keep up with the times, and who will also work with the thoroughness of the gardeners of old, there are to-day hosts of opportunities; but for those who *know* so much and *do* so little, the twentieth century will prove a barren desert to traverse.—ONWARD.

## Wallflowers.

Old-fashioned Wallflowers, growing almost wild, were the admiration of our fathers, and often one has seen them among the ruins of some old castle, their fragrance and brilliant colours giving a romantic touch to the surroundings. Seeds sown over walls produce plants in the crevices. One marvels at the advancement that has been made in the size of bloom and richness of colourings, while still retaining the delicious fragrance of the original. Being useful for pot culture or window boxes, making splendid beds or borders, or used for naturalising in shrubberies, ditch banks, wild gardens, &c., they are adaptable to almost any use; while for cutting at a time when flowers are none too plentiful they are invaluable. It is not everyone who is acquainted with the variety of shades of colour now obtainable, as one does not often see any but the ordinary blood red and yellow kinds. Among the lesser known may be mentioned as worthy of cultivation the following few varieties:

Ruby Gem is a shade of rich ruby violet, with a satin-like sheen; planted in masses it gives a very fine effect. Eastern Queen, quite distinct, a charming apricot shade that changes to a light salmon red as the flower becomes full. Vulcan, a new dwarf growing variety producing very large flowers of an exceedingly rich velvety crimson hue, which will undoubtedly become a great favourite. Primrose Dame, sulphur coloured, of dwarf habit, being very useful where a pale yellow is required. For an effective yellow Pure Gold, a rich golden shade, is unsurpassed. Another good yellow is Cloth of Gold, the flowers being large and colour pleasing. Golden Monarch is a new yellow, a deep golden, its bold spikes contrasting well with the equally rich Vulcan. Harbinger is a favourite red of a bright shade. The Moor, a dark brown, is a compact grower, which may be treated as an annual if sown early in the year, or when sown late in the season will come into bloom in February.—J. W. J., Oswestry.

### The Travels of an Orchid Hunter.

The matter hereunder printed is taken from Albert Millican's book entitled "Travels and Adventures of an Orchid Hunter," and was published in 1891 by Messrs. Cassell and Co. We reviewed the work at some length, and on taking the book from a shelf recently, it seemed to us that some passages were of keen interest and value to the practical cultivator; hence the excerpts. In his work, the author describes his exploration of the valley of the Magdalena River, and to Bogota, the capital of Colombia, in South America. Bogota is set high up in the Andes, and is a most enticing city.

"The next place of interest in the neighbourhood is the village called La Palma. This is two and a half days' journey on mules from the emerald mines in a north-westerly direction, being situated much lower than the *Odontoglossum crispum* district. The adjoining hills produce most splendid forms of *Cattleya Warscewiczii*. The ride is most enjoyable, the track lying through most beautiful scenery, especially along the banks of one small stream, where the trees are literally covered with *Cattleya labiata*. When I passed that way a large number of them were in flower, presenting a sight of indescribable Orchid beauty. Further along I met with a pretty delicate variety of *Compactia* hung on the very tips of the branches of a kind of Willow overhanging the water, so near that in the rainy season they must be submerged, while the majority of them must always be wet with spray. The village of La Palma is one of the best of the old Spanish style, most curiously situated in a hollow of the tops of the mountains, which look like extinct volcanoes. The people are remarkably hospitable, and receive all travellers with the greatest kindness. Unhappily, the magnificent varieties of *Warscewiczii* have been cleared away from the neighbourhood long ago, and now, as in other parts, the Orchid collector must take a journey of at least two days into the heart of the forest to get his plants, or send someone and wait three weeks in idleness and suspense in a monotonous village. The track into the forest is miserably bad, and to reach the plants is even dangerous; but those who have seen them in their forest home in all the glory of *Cattleya Warscewiczii* will admit with me that the sight is worth all the trouble of forest life. When I say that the sight of the plant in flower is very beautiful, Orchid fanciers at home will imagine that large quantities are to be seen in bloom at once. This is not generally the case with any class of Orchids I have seen in their native woods; it is rare to see a tree with more than four or five plants, and these perhaps not all in flower at once; but in the good districts, before the plants were taken away so much, almost every tree and ledge of rock would have some one or more specimens in bloom, so that a large quantity might be seen in the course of one day.

"Near La Palma, but on higher, cooler ground, I found a few small plants of *Miltonia Phalanopsis*, and in another locality quite a clump of *Oncidium Kramerianum*, as well as *Chysis*, *Bolleas*, and various *Oncidiums*. The vicinity of Muzo, near the emerald mine, is where I have found the largest quantity of the glorious Blue Butterfly (*Morpho Cypris*), some of them measuring 7in across the wings, of a radiant blue that few artists' pencils can depict. Although *Cattleya Warscewiczii* is exported largely from La Palma, it is also found growing, mixed with *Cattleya Dowiana aurea*, in the State of Antioquia. I have collected *Odontoglossum Pescatorei* in the hills near to Ocaña, in the Department of Santander; but it would be wearisome to my readers to enumerate all that occurs in the tiresome ten days of riding over the Andes from the town of Bucaramanga to the *Pescatorei* grounds. On the top of one of the high mountains on the way, near a village called Cachiri, near Bogota in Colombia, at a height of 10,000ft above the sea-level, I passed on the side of the track thousands of *Masdevallias*, chiefly of the *Harryana* variety. On another hill, two days' journey further along, but much lower, the trees are hung to crowding with the dainty little *Oncidium cucullatum*. Any future novice Orchid hunter in search of *Odontoglossum Pescatorei*, will find it by leaving the town of Ocaña, passing across the magnificent plains called La Savanna de la Cruz, and entering the chain of the Andes on the western side. Here, amongst the matted, moss-grown vegetation, *Pescatorei* is growing side by side with *Odontoglossum triumphans*, while the creeping rhizomes of *Odontoglossum coronarium* cover the roots of the same trees. I have seen the curious *Anguloa Clowesi* and the pretty *Ada aurantiaca* here as well, while in the cooler parts that choice little *Odontoglossum blandum* grows in profusion in a peculiar mist which reminds one of a continual Turkish bath. It is all very well to see this fastidious little Orchid in its natural beauty, but it is quite another thing to succeed in bringing it home to England alive. Many of the plants die before they leave the coast, many more before they pass the West Indies; a few reach the Azores, and fewer still arrive in England safely.

**Cattleya atalanta superba.**

The hybrid (from *C. guttata* Leopoldi and *C. Warscewiczii*) was staged by Messrs. James Veitch and Sons, Ltd., of Chelsea, on August 4, in the Drill Hall meeting of the R.H.S., when an award of merit was accorded. The sepals and petals are rosy purple, while the lip is richer and deeper purple. It is one of the handsomest varieties seen for a considerable time.

**The Week's Cultural Notes.**

I

One of the most deceptive of Orchids in appearance is *Saccolabium giganteum*, its large, fleshy leaves and strong habit giving the inexperienced an impression at first sight that it must be a very easily grown subject, one kept in health without any difficulty. But this is not the fact, as cultivators have found to their cost. Perhaps the principal reason is that it flowers, and flowers very profusely, in the middle of winter, when the energies of the plant are at its lowest ebb, and when the climatic conditions outside make it very difficult to maintain a congenial atmosphere in the warm houses.

It behoves those in charge of it, then, to make the most of the growing season with it, and to prepare it now while the weather is suitable for the strain of flowering later on. A brisk moist temperature by day, running up on fine afternoons to 90deg or 100deg, with ample sunlight and judicious ventilation, will produce free yet solid growth, and this is the desideratum. Immature growth, rushed on in strong heat and moisture, is the kind that falls a prey to spot, that dread scourge of distichous-leaved Orchids. Plants so treated soon go wrong, the foliage drooping in early spring, and the spike of flower being poor and washy in colour.

The Golden Chain Orchid, as *Platyclinis filiforme* is popularly known, is now fully in flower, and apt to be thoughtlessly treated. At the time the blossoms open the pseudo-bulbs are only partly grown, and to place the plants about in draughty passages or corridors, or even in the conservatory, is to court defeat. The flowers last a little longer, it is true, but the pseudo-bulbs are badly checked. The best plan is to keep them in a dry part of the house in which they are grown, avoiding syringing in their immediate locality, and as soon as the flowers are past their best to cut them, and return the plants at once to their growing quarters.

Imported plants of *Odontoglossum Harryanum*, *O. grande*, and others that are pushing flower spikes, should have these removed to avoid injury to the plants, or at least they should only be allowed to carry one or two flowers to perfection, just to show what the variety is like. The former especially is easily injured in this way, many fine plants having been reduced to an almost flaccid state by the strain of flowering before being properly established. They are in most cases sufficiently weakened by their journey home, and when further depleted of energy by premature blossoming, I do not envy anyone the task of restoring them to health and vigour.—H. R. R.

**The Boom in Orchids.**

Anyone visiting the English flower market at Covent Garden will be surprised at nothing more than the profuse display of Orchids on sale as cut bloom in spikes and in full flower in pots. Amongst a few of the prettiest specimens on show at the present time, we were particularly struck with the following:—*Cymbidiums*, from 2s. 6d. to 3s. a dozen blooms; *Coelogynes*, from 2s. to 3s.; *Laelias*, from 3s. to 5s.; *Odontoglossums*, 2s. to 4s.; *O. crispum* and *O. Pescatorei* being very fine indeed. The *Cattleyas* are high priced, being worth from 12s. to 18s. a dozen blooms. *O. Alexandrae* formed a leading line in these popular Orchids, and, as usual, was well to the fore. For growing in a house with Carnations, with a night temperature of 55 to 57deg., *Cypripedium insigne*, *C. Lawrenceanum*, and *C. Spicerianum* will be found excellent. So will *Coelogyne cristata*, *Laelia anceps*, *Odontoglossum citrosum*, *O. grande*, *O. crispum*, *O. Insleayi*, and *O. Rossi*.

*maius*, and *Oncidium crispum*. The culture of these Orchids is by no means difficult. In brief, they need watering in winter only when they are dry. In the spring and summer, when they are growing, they should be syringed and watered freely. They should also be shaded from the hot sun. Pot Orchids do well in rooting material made up of equal parts of peat and sphagnum moss, and the pots should be quite half full of drainage. Orchids ought to be freely grown by the million. Most of the cheapest varieties need no more skill to flower them to perfection than the best strains of *Cyclamens* require. As the roots or bulbs can be purchased as cheaply as 2s. 6d. and 5s. each, Orchid culture cannot fail to increase in popularity.—(Western Morning News.)

**Coelogyne Dayana**  
with 436 blooms.

A remarkable specimen Orchid, which secured the silver medal of the Massachusetts Horticultural Society, was exhibited in Horticultural

Hall, Boston, on May 23. It was a single plant of the *Coelogyne Dayana*, and had 436 blossoms. It was grown in the conservatory of Mr. W. P. Winsor of Fairhaven, by P. Murray, gardener.

**American Society for Horticultural Science**

A movement is on foot to establish in the United States a society for horticultural science. Professor Beach, of the New York Experiment Station, Geneva, N.Y., is an active promoter of the society, and those interested should address him for particulars. The object of the society is to more fully establish horticulture on a scientific basis. The membership would naturally be made up of the horticulturists of the experiment stations and of the United States Department of Agriculture, together with other scientists whose work has a horticultural bearing. The meetings would be held in connection with those of some kindred society, as the American Pomological Society or the American Association for the Advancement of Science.

**Cattleya atalanta superba.**

#### Feeding Planted-out Stock.

The question of when, how and what to feed his plants is often the most difficult problem confronting the novice. When to feed is a question that the condition of the plants themselves will best answer. As long as they are keeping a dark, healthy green and making large foliage they will not need feeding to any extent. We generally commence feeding about ten weeks after planting, which is, say, by August 1. At this time a top-dressing of bonemeal and rotten manure is applied, and from then on liquid manure is constantly given. Some growers think it better not to feed before the bud is set, but while, as before stated, you must be guided by your plants, whether the bud is set or not is of little importance if the plants are needing nourishment. We always use a Kinney pump in applying liquid fertilisers, and find it saves much labour. We use chiefly sheep manure for making liquid with a change of sulphate of ammonia or nitrate of potash in between, using these last in the proportion of one pound to a 50-gallon barrel of water. As each variety shows colour we discontinue feeding, as experience has taught us to keep well on the safe side, and feeding too long means a soft, flabby, easily injured flower, if nothing worse.

#### Bud Selection.

It is at this point where many growers even yet make their grand mistake. Why this is so in the face of all that has been written and spoken about the difference between crown and terminal buds, it is difficult to say, but many growers still rub off the crown bud, and with it goes their chance of winning fame. Plants propagated in March produce buds about right in August. Mums so treated will, broadly speaking, produce a bud in June after they have commenced to grow vigorously. This is, of course, removed, and then another will be produced about the end of July. When this also is removed, you will get a large percentage of your plants to produce another crown bud about the third or fourth week in August, which will be a good time to retain them.

This rule will not, of course, work out in handling varieties of the Vivand Morel type, which persist in throwing buds in season, out of season, or any odd time they feel like it, but in a broad, general way it can be depended on. With most varieties it is safe enough to take the first bud that appears after the 21st of August. There are a few exceptions, however, many of the pink varieties producing better coloured flowers from buds taken in September. The idea used to be that one could not get the foliage well up to the flower if crown buds were taken, but where the plants are grown right, that is, with a short-jointed growth, the neck is not too painfully apparent.

As the flowers develop, less water is needed, and a crack of air should always be left on top of the house at night to keep the atmosphere dry and moving. Some shading of the pink and red varieties may be necessary during the bright days of October; in fact, we always shade our entire house by spraying a lime-wash over the roof.

#### Packing and Transit.

The packing and transit of the blooms is also an important item, for it is useless to have good flowers if they get bruised during transit to the exhibition hall. After considerable thought on the subject of packing and noting the different styles adopted by the different growers, I have come to the conclusion that as good a way as any, and certainly the least troublesome, is to pack the blooms flat, with a good pillow of paper for the neck of the flower to rest on. If lots of tissue paper be used round the flowers, I am convinced that the rubbing and bruising is less by this method of shipping than by any other.

#### Diseases and Insect Pests.

While not exceptionally numerous, they are yet numerous enough to keep a man on the anxious seat all the season. The various leaf spot diseases may be kept in check by the timely use of bordeaux or sulphide of potassium, the proportions of the bordeaux being one in 50, and of the potassium sulphide half an ounce to a gallon of water. Black and green fly may be easily kept under by the use of tobacco. The green fly is the worse of the two, as it works down in the extreme growing tip of the plant, and its presence is not suspected until considerable damage has been done. Thrip, red spider, grasshoppers, caterpillars and a general assortment of "bugs" have their day, more virulent some seasons than others, but success in any business only comes

by careful close watching, and Chrysanthemum growing is no exception.

I give you herewith a list of what I consider the cream of the varieties, and, remember, unless you keep up to date with your varieties, you are liable to be turned down in a very close competition.

**WHITE.**—Nellie Pockett, Mrs. Weeks, Mme. Carnot, and Timothy Eaton.

**YELLOW.**—Mrs. T. W. Pockett, Mabel Morgan, Colonel D. Appleton, Mrs. Thirkell, Yellow Carnot, Matthew Smith, and Lord Salisbury. These two last named are spotted more or less with crimson, but they are very large flowers, and will make their mark.

**PINK.**—Mrs. Coombes, Marie Liger, A. J. Balfour, Vivand Morel, Mrs. Barkley and R. E. Richardson.

**ANY OTHER COLOUR.**—Kate Broomhead, W. R. Church, Mr. Carrington, Millicent Richardson, Chas. Longley and Lady Anglesey. This list could be much extended, but if I were confined to a given number they alone would be my selection. —W. H. T.

## Book Notice.

### Sweet Violets and Pansies.\*

Such precious little garden flowers as these deserve to have the history of their development recorded in book form. The work is written by specialists, and edited by Mr. E. T. Cook.

The Pansies of the flower shows—gorgeous and handsome fellows—are evolved from the native tricoloured Viola or Heart's-ease, which one finds north, as well as far south in Great Britain. It has a good many varieties, and some of these were secured to start with, cross-bred, and carefully cultivated. Soon named varieties arose, and the progress of improvement is still in operation amongst Pansy lovers. *V. altaica* was probably also a parent to the earliest Show and Fancy Pansies.

The English Show Pansy is classified as yellow grounds, white grounds, or selfs; and what the characteristics and properties of a perfect flower are, have been told in this book. Mr. R. Dean, the writer, furnishes some cultural hints, with selected lists of varieties. "The Show Pansy," he says, "is essentially a northern flower, and it is always well, when a collection is secured for the south, to have the flowers from a northern locality."

Then there are the Fancy Pansies, the term "Fancy" having been applied many years ago to flowers which could not be brought into line with the yellow grounds, the white grounds, and the self-coloured Show varieties.

We find a protest against the showing of Pansies in paper collars, and overdressing. To quote: "They are dressed so elaborately that the dressing only stops short of applying actual paint and perfumery," which is true in some cases. And the term "bedding Viola," is railed against. These should be called "Tufted Pansies," being "hybrids of Pansies and alpine Violas [*V. cornuta*]." There are Violas that are tufted and Violas that are not—the German, French, and other Pansies do not spread at the root as other Pansies do. . . . The term 'Pansies' is a good one in all ways; for without an English name we shall always have confusion with the Latin name for the name of wild species. . . . Cross-bred garden plants should have popular English names." At the same time we cannot overlook the fact of the origin of the whole race—they are essentially Violas.

The rayed and rayless Pansies, also the miniature flowered section, which includes the exquisite *Violetta*, Robin, and others, are well treated here. The alpine and lowland species of Viola are tabulated alphabetically, and their various characters discussed; while the "Violets" of the gardener (which are varieties of *V. odorata*), receive ample attention. The yellow variety, *V. sulphurea*, does not, however, seem to be mentioned.

Those who are really interested in the genus Viola, and its hybrid and cross-bred offshoots, will find much of value to them in the work to which we have drawn attention.

#### A Noted Shrewsbury Fungologist.

The Shrewsbury Town Council recently conferred upon Mr. W. Phillips, Shrewsbury, the honorary freedom of the borough, in appreciation and recognition of the eminent services he had rendered to it. The Mayor, after Mr. Phillips had taken the oath of allegiance, spoke of his valuable researches in the history of Shropshire, of his work as an archæologist, and as a botanist, remarking that he had written the acknowledged best book on Fungi. He was also regarded as an European authority in cryptogamic botany. In shooting, too, he has distinguished himself, being the holder of the bronze medal, won at Wimbledon in 1860, and the Memorial Challenge Cup, presented by Major Cholmondeley, and won outright in 1866.

\* "Sweet Violets and Pansies." Price 3s. 6d. net. Country Life Library.

# NOTES & NOTICES

## Gardening Appointment.

Mr. James Foster, for the last four years head gardener to F. Lassetter, Esq., Heverswood, Brasted, Kent, has been appointed in a like capacity to Mrs. Insole, Ely Court, Llandaff, Glamorganshire.

## Croydon Horticultural Society.

The members of this society were well entertained at their rooms, the "Sunflower" Temperance Hotel, George Street, on the 18th inst., with a highly interesting and instructive paper on "Orchard and bush fruit pests, and how to combat with them." The lecturer was Mr. A. Maslen, Bramley Hill House Gardens, and a very full report of his essay has been published in a Croydon newspaper.

## Tavistock Flower Show, August 12th.

May I say a word for, and of, this very old religious settlement, as well as of the present day flowers and fruits which it exhibits? The line of nearly all the ancient inscribed stones of Devon passes through Tavistock as a kind of centre. The Ogham (ancient Irish writing) which they bear is proof of ecclesiastical and Irish intercourse. They probably indicate, therefore, a period of active mission work on the part of the Irish Church about the latter part of the fifth and first half of the sixth centuries. One stone contained the letter "b" wanted to complete Dr. Ferguson's South British Ogham alphabet; while another, found across a brook, near Fardel, Cornwood, is now in the British Museum. This latter was the first stone found in England with an Ogham (Irish) inscription.—X.

## The Gardeners' Dinner and Reception.

Kindly permit me to use your valuable columns for the purpose of reminding all those of our fraternity of either sex, who may purpose attending the Gardeners' Dinner at the Holborn Restaurant, on September 29th, that the event will soon be here, and it will be well to arm themselves early with dinner tickets, lest, too late, they find the supply is exhausted. So many gardeners and others from all parts of the kingdom will be present that the gathering will certainly have a distinctly unique character. Amongst others eminent in horticulture who purpose being present is that venerated rosarian, Dean Hole, who will cheerfully support the esteemed Chairman, Leopold de Rothschild, Esq., and warmly greet all brother gardeners. It will be a gathering that many may never see repeated. Applications of any nature should come direct to me, at 62, Richmond Road, Kingston-on-Thames.—ALEX. DEAN.

## Royal Horticultural Society.

The Royal Horticultural Society will hold a special exhibition of Dahlias on Sept. 1 and 2, in conjunction with the National Dahlia Society, in the Drill Hall, Buckingham Gate, Westminster. At this meeting (unless by special arrangement and permission) only Dahlias can be shown with the exception of flowers, fruits, &c., for certificate. All Dahlias, including those shown for certificate, must be left on exhibition until 6 p.m. on the second day. A lecture on "Judging Cactus Dahlias" will be given on Sept. 1, by Mr. C. G. Wyatt, at three o'clock.—At a general meeting of the Society, held on Tuesday, August 18, twenty-five new Fellows were elected, among them being the Right Hon. Sir Francis H. Jeune, G.C.B., Col. T. H. Skinner, and Dr. A. Henry, making a total of 1,095 elected since the beginning of the present year. Intending exhibitors at the Fruit and Vegetable Show, to be held at Chiswick on September 29, 30, and October 1, can obtain an official entry form, together with schedule of prizes, on application to the Secretary, R.H.S., 117, Victoria Street, London, S.W. Entries for this show close on September 22. There will be a special tent for horticultural sundries. A cold luncheon will be provided on September 29, at which the Council, Judges, and the Committees will be present, and for which all interested in the show can obtain tickets (3s., including wine or beer) on application to the Secretary, 117, Victoria Street, S.W., before the 27th day of September.

## Mr. Wm. Tricker, New Jersey.

Mr. William Tricker, in charge of the aquatic garden department of H. A. Dreer and Co., Riverton, New Jersey, U.S.A., and author of the "Water Garden," has been appointed superintendent of the new estate of W. K. Vanderbilt, jun., at Great Neck, L.I. The estate runs to 500 acres, and Mr. Tricker has been entrusted with the laying out and development of the same. Much planting on the estate is in contemplation.

## Corrected Awards from Shrewsbury.

"I beg to draw your attention to page 177, last week's issue, under heading of awards. It was a small gold medal I received, not a silver one.—Yours respectfully, AMOS PERRY."

"In your excellent report of Shrewsbury Show, you have one error which I shall feel greatly obliged if you will correct, viz., decorative class 33, for a harp, I was first.—Yours, &c., WM. TRESEDER, Cardiff."

## Brambles Plentiful.

Housewives will be delighted to know that in the Blackberry districts there are certain signs that the coming crops will be immense. The berries are almost as thick as the leaves on the bushes. The common Blackberry flourishes in all the three kingdoms, and is abundant everywhere. There is no doubt that tons of these fruits will be marketed in pound punnets and gallon cross-handled baskets, for of recent years they have been retailed side by side with glasshouse Grapes from the Channel Islands. It will not be surprising to find them making as much as 9d. a pound. In the preserves of Lord Cecil at Shipbourne, in Kent, are to be found the largest and most delicious Blackberries in England.

## Testimonial to Mr. Thomas Humphreys.

Quite recently we notified the appointment of Mr. Thomas Humphreys to the curatorship of the Birmingham Botanical Gardens. During the past ten and a half years he has been assistant superintendent of the Royal Horticultural Society's Gardens at Chiswick, and secretary of the Floral Committee. Mr. Humphreys is about to assume his new duties at Birmingham at the beginning of October. In view of these facts the members of the several committees with which he has been so long connected thought it a convenient time to recognise his valuable and faithful services with some testimonial. Accordingly, with this object in view a committee has been appointed to receive any subscriptions which those whose duties have led them in contact with Mr. Humphreys may feel disposed to give. The chairman of this committee is Mr. H. B. May, Dyson's Lane Nurseries, Upper Edmonton, and the secretary Mr. Richard Dean, V.M.H., Ranelagh Road, Ealing, W.

## The New Garden.

The "Pilot" observes that "The Royal Horticultural Society is to be congratulated on becoming the possessor of what is probably the finest hardy plant garden in England. It was bought many years ago by the late Mr. G. F. Wilson, who saw in it that variety of soils and combination of exposure and shelter which in the end enabled him to grow large numbers of plants, which gardeners had till then thought could only be grown under glass. Whether Mr. Wilson was ever beaten by a plant we do not know, but the instances must certainly have been few. What the visitor commonly heard from the host was: 'They can't grow that in such and such a garden—here, you see, it is a weed'; and the statement was not an exaggeration. Partly from the opportunities which the Wisley garden afforded of trying every strange plant in many different situations and surroundings, partly from the faculty seemingly possessed by great gardeners of making plants grow by merely looking at them, Mr. Wilson did score an extraordinary number of successes. It would have been a disaster to horticulture if this matchless collection had been scattered, and the calamity has happily been averted by the munificence of Sir Thomas Hanbury, himself the owner of one of the most famous gardens in the world. He has bought Oakwood from Mr. Wilson's representatives, and presented it to the Royal Horticultural Society. The Society was greatly in want of a better garden than Chiswick, and to some of its Fellows it seemed a mistake to give the provision of a new hall the preference. Now, however, it will have both, and, thus equipped, will we sincerely hope, start upon a new career of gardening usefulness."

### Standard Stocks for Roses.

In reply to "A. C.," I think standard stocks are fully appreciated; indeed, many amateurs on beginning use nothing else. Their advantages may be summed up as follows: They are much best for Teas and for some of the Hybrid Teas, better growth (especially in the "moderate" growers), and better flowers being obtained from them. I hardly ever cut a show Tea from a dwarf plant, but there are exceptions. They are easier to bud, especially for old folks like myself, and in wet, dirty weather, such as we are having at present; and, as in "A. C.'s" case and my own, the amateur can get his own stocks in the winter with exercise and interest.

But they have their disadvantages. If their suckers are plainer to be seen, there are also a great many more of them than on the Briar cuttings, and the higher the stem the greater the tendency to suckers. They are not, as a rule, so long lived as the dwarf plants. The general opinion, with which I agree, is that, on the whole, H.P.'s do better as dwarfs. Nor are they so hardy. Not only is it more difficult to protect standard Teas against frost than to cover up dwarfs, but the stem itself of the standard stock is not perfectly hardy. In very severe winters I have lost standard plants, and have found it clearly shown that the damage—frost bite—was to the stem, not to the Rose. The standard stock cannot stand extremes of heat or of cold, and for this reason it is never used, and is almost unknown in America and Australia.

Tall standards, I think, are a great mistake for many obvious reasons. None of my standard stocks stand more than 2ft out of the ground; and what with the staking and tying, the suckers, their short lives, and the extra cost to purchase them, few rosarians would grow standards, were it not for their great advantage in giving better blooms of the Tea, and some of the Hybrid Tea Roses.

Like "A. C.," I have been personally getting standard stocks for twenty-five years or more, but I am filled with envy and admiration at his getting 300 or 400 stocks in three or four days. I should doubt if I have ever gathered more than fifty in a day, though I have collected 1,700 or 1,800 in a winter; and often a dozen has been the whole of my "bag" for a winter's morning. But I am rather particular about them, and it is long since I had any fresh hedges to search.—W. R. RAILLEM.

### "Beautiful Roses."

This is the title of a book recently published by Messrs. Simpkin, Marshall, Hamilton, Kent and Co., Ltd., of London, from the pen of Mr. John Weathers. It has thirty-three full page coloured plates by Mr. John Allen, the size of these being 8in by 5in. The writer of this neat little work (numbering over 150 pages, bound in crimson with gold lettering, and having an excellent index) has gone systematically about his task. He begins by asking "What is a Rose?" and lays down the law with regard hereunto. Culture, propagation, pruning of Roses in garden and greenhouse are explicitly described, and at the cost of six shillings (or thereabouts) the book cannot be considered dear.

### Dwarf Varieties.

On page 174 of the Journal I gave a selection of single flowered varieties, all of easy culture; I now append a further selection of varieties which I truly describe as "Garden" Roses, sorts really valuable for the garden or for cutting, more than for exhibition as individual blooms. All the varieties I name are of easy growth, therefore the more valuable to the amateur as well as the professional.

Papa Gontier I unhesitatingly place first, owing to its great merit in freedom of growth and flower, its handsome form of both bud and petal, and its grand appearance in a cut state. From early in June until quite late in the autumn the bright rosy crimson blossoms are to be found. This Rose is equally good, too, for forcing.

Cheshunt Scarlet or Glory of Cheshunt in a mass is perhaps the most vivid Rose in existence; it is of sturdy, compact growth, flowering quite freely, and lasting a long time in flower. For a large or small bed of dwarf growth where a maximum of colour is required, this is the Rose to plant.

Gustave Regis grows freely and flowers continually. The flowers are produced in clusters, the buds are very pointed, canary yellow in colour, with a deeper centre, and before they unfold, a Picotee-like edging enhances their appearance considerably. Even when fully developed the huge shell-like petals are admired.

Kaiserin Augusta Victoria is undoubtedly the finest white flowered Rose in existence where dwarf growth is required. Every bloom, whether as a bud or fully blown, is perfect in shape and purely white. When a mass of this Rose is required I would advise thick planting, as it is of upright growth.

Gruss an Teplitz is quite one of the best of autumn flowered Roses. The shading of velvet over the bright scarlet crimson enhances its appearance. For a mass of colour this Rose is unequalled in August and September; its only fault when in a bed is that its flowers droop considerably. Its proper place is growing up a pole, in such a position the blooms show to perfection.

Mdme. Abel Chatenay flowers freely and continuously. Every bloom, large or small, is perfect in shape. The colour, carmine rose with salmon shading, is distinctly pleasing.

Lady Battersea has perhaps the longest footstalks of any Rose, thus making it more valuable for cutting; it flowers incessantly. The colour is cherry crimson.

Augustine Guinoisseau, commonly known as white La France, is one of the most free flowering of Roses, white, slightly tinted with flesh colour.

Camoens, bright rose, is exceedingly pretty in the bud, excellent for cutting.

Corallina is a grand autumn flowering variety, deep rosy crimson.

Dr. Grill, coppery yellow, shading to clear rose, very distinct.

Isabella Sprunt cannot be omitted from any list, so beautiful are its light yellow buds, produced as they are at almost all seasons.

L'Idéal is a gem for buttonholes. In colour it is yellow and metallic red, shaded, streaked, and tinted golden yellow.

Ma Capucine is also one of the best buttonhole Roses, bronzy yellow, shaded red.

Mdme. Jules Grolez is free flowering, China rose in colour.

Mdme. Pierre Cochet, orange or apricot, shaded yellowish white. Mdme. Planter, pure white, is quite one of the best for beds, giving an abundance of blossom.

Marquis of Salisbury, rich crimson, is a very beautiful variety, almost always in flower. Salmonea combines a remarkable contrast of colour, bright crimson with light salmon centre.

Souvenir de Catherine Guillot, coppery carmine, centre shaded orange, very free and attractive.

Sunrise is quite unique in its colouring, the outer petals reddish carmine, shading to delicate fawn and pale salmon within. Beryl, deep golden yellow, long, perfectly formed buds.

Homère is almost a perpetual flowering variety, especially if growing at the foot of a south wall, blush with deeper centre. Liberty is at once the most charming Rose of its colour, bright velvety crimson.

Mdme. Guinoisseau, pale canary yellow, long buds. Princess de Sagan is a capital autumn flowering variety, therefore valuable, velvety crimson.

Safrano, apricot. Sunset, rich, tawny, shaded saffron, beautiful in bud.

Marie Pave forms handsome bushes in a short time, and gives its white flushed pink blossoms quite freely during the whole of the summer and autumn.

Anna Marie Montravel is quite a dwarf growing variety, producing its pure white blossoms in huge clusters, capital it is for the edging of beds or borders.

Gloire des Polyantha is another dwarf-growing sort. The colour is pretty, deep rose with a white base to each petal. Viscountess Folkestone, silvery pink, a beautiful free flowering variety, very fine in a mass—E. MOLYNEUX.

(To be continued.)

## The "Daffodil King" on Tour.—No. 9.

(Continued from page 145.)

Christchurch, New Zealand, was settled by immigrants under the auspices of the Church of England, composed largely of the well-to-do, so that they had good capital to start with, and the refined elegance remains. It was intended to be an exclusively Episcopal settlement, but it has Christianity in as many forms and as many aspects as may be studied in New York. The place is grand in reserved lands, but wealth has not been of equally rapid growth, and while large areas had been retained for public parks, the development is retarded for want of money. This was so palpably evident to our visitor that Mr. Barr was led to investigate the subject, and in the company of a newspaper man fixed on a slip of land having great advantages for building plots, which would have enhanced the park lands, destroyed the loneliness of a main road, and by widening the footpath on the banks of the gentle flowing Avon, have given the inhabitants a Park Lane worthy of their beautiful

town, where the wealth and beauty of the town could have disported themselves between the morning and evening services such as is to be seen in the London Park Lane. The newspaper man made out a good case of an ensured annual income of £1,800 a year, and the newspaper reporters being always on the track of the veteran traveller, several stirring articles were written, but the pride of admitted poverty appeared too strong. By Mr. Barr's suggestions, a lonely and rough road would have been quite transformed, and a fine, broad promenade along the banks of the gentle flowing Avon would have been secured. The popularity of the cycle is as great in Christchurch as elsewhere, and continual friction existed between them and the park authorities. The cyclist, however, held his own, and was wont to make short cuts through the reserve; and there, again, the want of money prevented the making of proper carriage drives and cycle paths. The agitation having been set agoing later visitors may yet see Christchurch rise to its opportunities.

Unfortunately, throughout New Zealand, a great many upright (Lombardy) Poplars have been planted, and being absolutely out of harmony with the native plants, Mr. Barr stated that he took every opportunity to decry them. The reason assigned, however, was that the plants of New Zealand are all evergreen, and it was a relief to the eyes to see the autumn tints of the Poplars. But Mr. Barr pointed out that there were other Poplars more in harmony with their own trees, and other forms of deciduous trees and shrubs that would give them the autumn tints and be beautiful. It may be mentioned in passing that Christchurch is a famous educational centre.

Turning now to Dunedin, this city was settled by the Scottish Church, for Presbyterians (consisted mainly of emigrants with small means), but there you may find the latest forms of theology, represented from America and London. The population of Dunedin is principally Scottish, and the town is the healthy, wealthy, and the most enterprising of the towns in New Zealand. When the gold seekers first arrived, the inhabitants refused to sell them food, objecting to have the riff-raff of Europe and Australia quartered upon them; but when the nuggets began to circulate the prospectors became welcome guests! Up to the present time the matrix of the gold, so to speak, has not been discovered, but dredging the rivers and the lands over which water once had flowed forms remunerative employment for thousands. The gold-dredging machine is a New Zealand invention, and has been exported to all countries of the world where "the yellow metal" is to be found in rivers.

While at Dunedin, in the month of April or early in May, Mr. Barr found it so cold that he had to have a winter suit made. Our friend remarked that it was somewhat singular that the Scotch should have settled in the colder, and the English in the warmer districts. He draws attention to the settlement of America to find a parallel. The Spaniards settled in the south-western parts, where the climate is not unlike that of Andalusia (Spain), while the "May Flower" with its freight landed in the eastern regions, which are in all respects English in their scenery, the only difference being in the native races that met them on landing. Had the British landed in the south-western parts, they would have found it too hot; while the east would have been quite untenable from cold, to the Spaniards.

Dunedin is very hilly. There is a good deal of amateur enterprise in planting on the surrounding hills the reserves, which are fairly extensive. Mr. A. Bathgate, a solicitor, is the moving amateur spirit in this enterprise, and gives up a good deal of time to pushing forward the planting of trees and shrubs. Their public gardening is, however, very backward, and in the company with the Mayor, who was anxious during his term of office to do something to mark his mayoralty, Mr. Barr went over their public gardens, and suggested a few alterations of pressing importance. But the Mayor was anxious to confine his benevolence to a new entrance gate, which, as the itinerant told him, would spoil the place, unless entirely relaid out, and this was by no means needed. What was wanted was a continuation of the shrubbery to the river bed, the improving of the river bank, getting rid of an old tumbledown gardener's house shutting out the glass structure where summer bedding plants were raised, widening and extending a flower border, bringing into prominence a glass-covered rockery, and locking up the gates at sundown.

Auckland, well northward in North Island, possesses some fine park lands, those at Mount Eden being under charge of Mr. Goldie, who formerly sent large consignments of Tree Ferns to B. S. Williams.

Referring to the warm lake region of New Zealand (Rotarudos), Mr. Barr considered it quite as interesting as the Yellowstone Park in America. It is true there is not the same grandeur as can be seen in the Yellowstone Park, but the mud and water geysers, the lakes and springs, are all of great interest. Some of these hot-spring regions are in the hands of Maoris, who charge a heavy rate for allowing the freedom of inspection. Near Auckland were the pink and white terraces which remained the wonder of the world, until they were destroyed some years back by a volcanic eruption, which carried off the entire top of the hill, causing the

lakes to dry up and killing a large number of Maoris. Auckland has a remarkably fine collection of South Sea Island relics.

A ride towards Pepperikee is wonderfully rich in foliage. There you may see Tree Ferns with their large spreading fronds, 15ft or 18ft long, growing as solitary specimens along the drive. Wanganoie River extends a long distance above Pepperikee, but can only be explored by canoeing; and the beauty of its trees and their foliage is indescribable. The river, for some considerable distance below Pepperikee is well clothed, and there may be seen the native Palm arising above the scrub. The lower reaches of the river are monotonous on account of the vegetation having been destroyed. Wanganoie is a town of some pretensions, but is a quiet place with a park and pleasure gardens.

On the way to New Plymouth, Mr. Barr spent a few days with a farmer to see the country, which is famed as a butter producing area. New Zealanders declare that they can supply better butter than the Dutch. The land here is admirably adapted for the purpose, and dairy farming is thriving.

New Plymouth is a nice little town, substantial inside, on account of the old Maori pa (fort) which still remains in its original condition, and to see what a Maori fort was like Mr. Barr made his visit to this district. He chanced to be there when the news of the relief of Mafeking was stirring the British race. At one of the centres where a demonstration was occurring, an Irishman, "who evidently had not kissed the Blarney Stone,"—his oration was so faulty—tried to vent the popular feeling in relief, but the populace growing impatient, they hauled him down and made another citizen speak in his place! They finished with three cheers, and the singing of "God Save the Queen."

## Providing Underground Rain-water Tanks.

One thing that all skilful horticulturists are agreed on is the great superiority of rain water to well water for application to the roots and overhead of cultivated trees and plants, especially those grown under glass. Therefore, underground tanks should be made in all glass houses for the reception of rain falling on the roof glass, and conveyed thither by inlet pipes connected with the overhead-glass shooting or valley gutter, as the case may be.

In the case of lean-to houses or three-quarter spans, the soft-water tank should be excavated under the pathway at the back. The sides and ends of the individual tanks should be cut evenly down and on the batter, so that the 4½in. brick wall may be built up close against solid earth from bottom to top. A "dip-hole," about 2ft square and 20in deep below the bottom of the tank (which should slope gently in the direction of the said dip-hole), should be provided in making the tanks.

This will allow a full can or bucket of water to be extracted from the tank as long as the bottom is covered with the crystal fluid. A tank 21ft long, 4½ft deep, with an average width of 3½ft (inside measurements), will hold about 2,000gals of rain water. A 4½in tie-wall should be built across the middle of the tank, leaving a space of 4½in from the floor-line in the centre of division wall, to enable the water to rise in both divisions at the same time.

The top course of brickwork should be built in cement, and the whole surface of work should be afterwards faced with compost, consisting one part of cement and three of sharp sand. In excavating for a tank of the dimensions given above when built, 9in more should be added to the length and width, and 4½in to the depth. A few short lengths of oak, 4in by 3in, placed across the tank at intervals of about 3ft, will afford ample support for the trellis pathway to rest on.

Each block of span-roofed houses should have two tanks of the description indicated run right across the several houses constituting the block—one at the bottom and one half-way up the length—a short length of lead pipe, say, 6in long, 2in or 3in in diameter, with a flange on top, being inserted in the gutter-valley immediately over the respective tanks, to convey the rain water falling on the glass roofs therein. It would be money well spent to make a pond or other kind of sunken reservoir, to take the overflow water from these tanks during the autumn, winter, and early spring months, thereby providing a good supply to fall back on in time of need—i.e., when a spell of dry weather has set in.

Still better, if a galvanised iron tank, capable of holding 1,000gals of water, is elevated, on a substantial frame-work, to the level of the ridge of houses at the highest end, and the water pumped up into it by a small gas or oil engine, or windmill, connecting the elevated cistern with the several houses by means of gas tubing, standpipes, and a length of hose, thus securing a boon that cannot be too highly valued in forcing-houses—namely, a supply of sun-warmed rain water laid on in readiness for use through the hose when required.—(From Ward's "Book of the Peach.")

### A Wanderer's Notes.

A Dublin correspondent who visited a lovely Sussex manor and two London gardens recently, sends a most interesting letter noticing some of the things he saw. Thus: Water Lilies at G— were splendid, so also Tea Roses, &c., and I never saw Rosa Wichuraiana so good as it is there, draping the flower garden steps, and dangling from the pergola amongst the bronzy leaves of Thunberg's Vine. Clematis viticella in great variety, from snow white to deep claret crimson, was also very dainty and distinct, and seems hardier and more free in growth than is C. Jackmani.

At Gunnersbury House, Acton, the coloured Water Lilies are very fine and beautifully focussed in a delightful and sheltered bit of water. The blue *Nymphaea gigantea* of Australia, in a frame, had flowers nearly 10in across, and is one of the most distinct and noble of all the *Nymphaeas* I ever saw, indoors or out. The Japanese Lotus, or *Nelumbiums*, are just opening their exquisite flowers outside at Gunnersbury in a tank of slightly warmed water; the first time I ever saw them healthy and happy out of doors in Britain.

Hollyhocks at Hampton Court, both single and double, are, and have been, very fine. It has been an ideal Hollyhock year, cool and wet, and they are very stately and handsome everywhere, and of all colours, from snow white to chocolate crimson, and, indeed, very nearly black. The most effective new plant on the mixed border at Hampton Court is *Senecio clivorum*. It is a little coarse in habit close at hand, but 50yds away it is a bold and bright and telling thing.

The cool and moist season that has given us good Hollyhocks and herbaceous plants, such as scarlet *Lobelias* and herbaceous *Phloxes*, has also added a new freshness and luxuriance to our town trees. Everywhere in town the London Plane is very beautiful and umbrageous. So also the lawn grass of London, *Poa annua*, is like rich green velvet under the trees in the squares.

### Against the Mole.

Mr. Collinson (on page 167) repeats the old plea that farmers, in killing moles, are destroying one of their best friends. "Facts are facts," he says. They are; and I, for one, believe that farmers are not so stupid as some people seem to think, and that in not a few cases they know more about the good or damage done by the animals and creatures on their farms than "the text books and works of reference" can teach them. The mole is insectivorous, as anyone with a smattering of natural history can tell from his teeth. Our four principal insectivores are the hedgehog, mole, shrew, and bat, which have similar teeth. Like the hedgehog, he would also probably be carnivorous when he got a chance such as a nest of young mice. No doubt he does good in destroying grubs, especially wireworms, and cockchafer and "daddy-longlegs" grubs; but I should say at least three-fourths of his food would be worms, and they, Darwin tells us, do as much, probably very much more, good than the mole's friends lay to his credit.

But he does good to the grass, we are told—that is, he brings up some of the surface soil (at the same time creating a drainage) which, scattered by the bush-harrow, does undoubtedly good by acting as a top-dressing. That is so; and if he would confine himself to working in the meadows during winter, and up to the beginning of April, he would do but little harm; but he does not, and molehills in the mowing grass are injurious to the hay, the scythes, and the machine, and to the pasture in the summer. As a cultivator of land I say to the mole, "No, thank you." I like to do my own draining in such places as I wish; I like to do my own digging in such places and at such times as suit me best. I have had people say to me with regard to bullfinches and sparrows, that they do me good by thinning the too great abundance of my Apple blossom. I do not argue. I say, I like to do my own thinning. Moles often get into my garden and do a lot of harm by their indiscriminate digging. Of course they do; you might almost as well say that a lot of children turned into a garden with their toy spades and told to dig where they liked would do no harm, as to deny that moles do harm to the gardener.

They throw up their heaps on my croquet or tennis lawns; they destroy quantities of seedlings in my vegetable beds; several times I have known a Tea Rose bed, when covered with leaves in winter, honeycombed from end to end and seriously injured. Obviously it is just the same with the farmers' seed-

lings and arable land, where the mole does more harm than in the grass. Farmers really are not so foolish as to pay for the destruction of moles, unless they see and know the harm they do. We do not want them exterminated, but merely kept within bounds—few things can get at them to prey on them, and they increase enormously where not attacked by man. They do not do very much harm in the low meadows where they breed, but must be kept down in the cultivated land.—W. R. RAILLEM.

### Plea for the Manetti.

If "W. R. Raillem's" remarks (vide issue August 15) had only been confined to the comparative merits or demerits of the Manetti, with the Briar or other stocks, I should agree with "A. C." on the inadvisability of rushing into print on its behalf. But when that most useful and popular critic, with the usual courage of his opinions, would sweep away the Manetti from the face of every professional Rose garden (very rarely does the amateur find even a corner for it), it is high time to break a lance in its defence, and show cause why it should not hold a prominent place; next to the Briar, of course I am glad to know the Manetti is used in our Rose nurseries, both small and great; ay! in spite of "W. R. R." quoting that eminent authority, Mr. George Paul, "that he could not sell plants on the Manetti."

May I be allowed here to give an extract from the venerable author of "The Rose Garden," Mr. William Paul, who, while he acknowledges his preference for the Dog Rose as a stock, of the Manetti, thus expresses himself: "Larger plants may usually be bought on the latter stock and at a cheaper rate. A good cultivator will grow Roses very well on either stock, provided with the Manetti he exercises due vigilance to keep in check the shoots of the stock which are constantly springing into life. On poor dry soils, where Roses on their own roots and on the Dog Rose are kept in condition with difficulty, the Manetti stock has often been found a boon."

Amateurs often ask, What is the Manetti? Where does it come from? Thomas Rivers, the great authority of his day both as an author and practical gardener, answers these questions in a few words. He says (writing in the beginning of the '60's): "I received it some twenty years since from Cairo for a stock. It was raised from seed by Signor Manetti, of the Botanic Gardens at Monga. All the Roses I have budded on this stock have succeeded admirably." Such is the verdict of history recorded by high authorities of a past generation in favour of Manetti. Now we will turn to the almost universal practice of Rose nurserymen at the present day, as a set-off against the pessimistic views of "W. R. R." of the value of the Manetti as a stock.

In most of the leading Rose nurseries, I believe, at least half of the different varieties of budding stocks are Manettis; and this, too, we maintain, greatly to the advantage of the public. Going round lately the large Kings Acre Rose and Fruit Nurseries, near my residence at Hereford, three breadths of Manetti stocks (nearly 70,000) particularly struck my attention, on noticing which the foreman remarked: "Ah, sir, if it were not for the Manetti I don't know what we should do to supply our customers. Briars are getting more expensive and difficult to buy every year; indeed, I believe we actually lose by the present price we charge for standards!" And this in a county like Hereford, where the Dog Rose or Briar grow in well nigh every hedge! "A. C." must indeed have been exceptionally favoured in getting his Briars so easily. Even when got, long experience speaks out sadly, that the percentage of those stocks that die, owing to early frost or drought, or previously by exposure of their roots in the interval after raising and delivering, is something enormous. All these drawbacks—and serious ones they are—enhance the value of the Manetti and assign a just cause why it should be so extensively grown.

No one can go more heartily than your correspondent does with "W. R. R." on the too common error of deep planting, whatever the stock may be; but surely, to introduce the subject, as analogous of aerial roots, as in the case of the Vine, from superabundant moisture in the canes, is wide of the mark, as also to speak of budding on the Manetti stock four inches below the ground on non-aërated soil! If the poor, distressed Rose plant, which is appealed to for an answer, were to give one, it could only be this: "Who are you speaking about? I don't understand."

The conclusion of the whole matter from the writer's point of view is that, given suitable varieties of Roses, i.e., all but a very few weak-growing H.P.'s and, of course, H.T.'s and Teas, the Manetti is an admirable, all-round, indispensable stock, and in almost every soil will hold, and more than hold, its own; while a pinch of common sense is needed in the selection of a few varieties, not to be budded on the Manetti, not a single pinch of "plant food" in any shape to grow big back-row blooms for exhibition should be given, and then the public will have no cause to complain of plants they receive grown on that stock. In the Rose garden of your correspondent there are now two great novelties of the season—H.P. Frau Carl Druschki and Ben Cant, on the Manetti between 6ft and 7ft high! What grand cut-backs will they not be next year.—HEREFORDSHIRE INCUMBENT.

### Among the Fruit Trees.

All too soon the damp, chilly evenings have come, and the fast shortening days proclaim clearly that autumn will soon begin. The summer cannot now atone for her past misdeeds and lack of brilliant sunshine; but let us hope that with the early days of the autumn a new era of sunshine and settled weather will begin. Given such conditions, September and October are indeed glorious months, especially for the fruit grower, for then the store rooms should be overflowing with a supply of good things for winter use, and the sunshine plays a potent part in preparing the wood to yield another year's supply.

Unfortunately, the crop of Apples and Pears in Britain is this year probably the lightest recorded for a generation, and under such trying circumstances many may be tempted to neglect their trees, to their serious detriment in the future. To the cruel frosts of last spring must be laid the principal reason of the failure of our fruit crops; but the unripened condition of the wood also had something to do with it. The blossom on many trees was not nearly so strong as usual, notwithstanding the fact that they bore only light crops the previous year, and undoubtedly many of them were imperfect, and under favourable conditions would not have set. In some low lying districts I can point to trees which did not bear a single blossom last spring, simply because the wood was unripe; and although we all hope for a finer and brighter autumn this year, it rests with the cultivator to do everything possible to facilitate the ripening of the wood.

When the time cannot be spared to carry out both summer and winter pruning, I have no hesitation in saying that September is the best month in the whole year during which to prune the majority of fruit trees. The great drawback to doing it then in ordinary seasons is that the trees are laden with fruit; but this season there is a clear course in far too many instances. Advantage should therefore be taken of such conditions to prepare the trees for the work of another year.

Trees of all descriptions have made a great amount of growth, and if pruning is done during the next few weeks the wood in every part will get full exposure while the leaves are carrying out the important work of sap elaboration. Then, in conjunction with favourable weather, many buds will be converted from wood buds to fruit buds, which under less favourable conditions will remain in the initial stage.

The method of pruning which is now generally accepted as the correct one for standards of both Apples and Pears consists of thinning out the shoots, so as to allow the light and air to reach every part of the tree, and shortening the points of the branches but little. The term "thinning out" is, however, rather a vague one, and the question arises, At what distance apart should the branches be left? Some might think a tree well thinned if the leading shoots were 1ft apart; and while a tree is young that distance will often suffice; but as it increases in size the extremity of the branches should be further apart, and the centre left comparatively open, to allow the light and air to freely penetrate the lower parts of the tree. The shoots of weak growers, too, need less room than stronger growing kinds. I find a suitable distance for the main branches is from 18in to 2ft apart. From the main branches young shoots should be left here and there at almost, or quite, full length, these young shoots quickly forming fruit buds along their whole length.

In pruning a tree on this system, the first thing to do is to reduce the number of the main branches if they are too numerous, and then to cut away superfluous side shoots. The latter can at this season be cut to within two or three leaves of their base without fear of their starting into growth. If the young shoots retained on the ends or sides of the branches are long and thin, remove a few inches; if fairly strong and self-supporting, do not shorten them in the least. By such means good shapely trees are produced, which do not send out hosts of strong shoots on the one hand, or become weak and drooping on the other through need of a little shortening.

In gardens where pyramids and bushes are usually grown instead of standards, the orthodox method of "spurring" the branches is generally followed, and pinching the shoots in summer is not often neglected. If this pinching has been done, September is an excellent month during which to complete the pruning, instead of deferring it till winter; but in those instances in which summer pruning has not been done, no time

should be lost in pruning the trees thoroughly. This spur system answers very well if root-pruning is practised in conjunction with it whenever the trees show a tendency to grow too strongly; but it entails infinitely more labour than the thinning out system already described for standards, and certainly does not, as a rule, give better results. It is therefore an open question whether a freer extension of growth should not be more generally encouraged with pyramids and bushes in private gardens. —H. D.

### Melon Plants Going-off at the Root.

The following is an answer to a query sent by "J. T. C.": The specimen you submitted for examination we found, under microscopic scrutiny, to be affected with root stem eelworm (*Tylenchus obtusus*). A bit of root stem treated with dilute spirit and teased yielded the "finest sight" of the blunt ended (the blunt applies to the head part, for the tail is sharp pointed) eelworm that has been presented to us in the many examples it has been our privilege to examine during many years.

It is solely a root stem affection, and gives rise to the disease known to Cucumber growers for market as "clubbing," because the stem of the plant in the soil is often much enlarged, the parasitic animal exploiting the host plant for its particular benefit, the irritation set up by the eelworm causing the plant to concentrate its energies on the healing of the injured part, and a great growth of cellular tissue is the consequence, albeit at the expense of the top growth, which suffers in consequence of the deprivation of nutriment, and collapses as soon as the eelworms have cut off the supplies by the destruction of the root stem tissues all round.

The eelworm is very common, found in most, if not all, soils where there are semi-dead and decaying root parts of plants, all freshly cut turfy loams we have examined yielding specimens of this species, and also stem-eelworm (*Tylenchus devastatrix*) from the decaying root stems of the natural herbage, particularly those of leguminous plants, especially Clover. The old gardeners might not know this, but they did know that turfy loam gave the best results when it had been stacked long enough to destroy the natural herbage, and had become what was termed mellow.

This mellow loam, often treated in the rot-heap with lime and soot for the destruction of contained animal pests, does not contain eelworms, for they evidently need living organic matter or an abundant supply of nitrogenous substance for breeding purposes, and do not find it in vegetation reduced to mould or inorganic matter, so that there were in olden times few, or no failures with Cucumbers or Melons, most of the crops of which were grown in dung-heated pits or frames, not more distantly than half a century. Raw, crude compost, therefore, is the beginning of eelworm disease, the pests being introduced in the turfy loam.

In this connection we particularly allude to stem-eelworm (*Tylenchus devastatrix*) and to root stem eelworm (*T. obtusus*). For root knot eelworm (*Heterodera radicola*) is not indigenous to this country, having been introduced from the Continent of Europe, and is an indoor rather than outdoor infection, though not uncommon on Tomato roots against walls, and even on Cucumbers and Vegetable Marrows on ridges of fermenting materials, being probably due to the plants being potted with old potting material, they being raised under glass, and bud-strong before planting outdoors.

When new, raw, or freshly cut turfy loam is used it should either be heated on iron plates to a temperature of 180deg to 200deg, or treated with boiling water or steam, in no case exceeding a temperature of 212deg, for that would probably prejudice the nitrifying micro-organisms, and a temperature of 135deg will destroy eelworms and resting spores of fungi; but to make sure, 180deg is as certain as safe. What a bother for so microscopic an object! Well, do the next best thing, and better the soil by adding to each 28lb a mixture of basic cinder phosphate eight parts, and kainit three parts, using 1lb of the mixture, and letting lie in stacks from late summer to wanting for use in early spring; then cut the stack straight down, stopping up and blending top and bottom outside and inside well together. Or, spread the turf out and sprinkle on it a one per cent. solution of formaldehyde (an aqueous solution of formaldehyde containing thirty-five per cent.), or, to be explicit, one fluid ounce formaldehyde to five pints soft water, and give the turf as good a wetting with this as is effected by an ordinary watering with water. The commercial price of formaldehyde is 1s. 6d. per lb. The nematodes collapse at once on being reached with the formalin—it is the same thing as formaldehyde, and Professor Arthur has shown that steeping Potato sets in a solution of half a pint of formalin in fifteen gallons of water for two hours is a complete specific for American Potato scale (*Oospora scabies*); and, if so, why not for other fungous pests that infect useful plants by the roots, such as sleeping disease in Tomatoes, Cucumbers, &c.? It is only one part formalin to 240 parts water, and it also will kill nematode worms, so that probably it might be used safely to the roots of plants in growth. But on this point we have no certain data,

our experiments being laboratory, and the one per cent. solution certainly injures the young rootlets of even ligneous plants, such as Roses, but the plants soon recover and grow away splendidly when freed from the nematoid worms, as the one per cent. solution certainly effects.

Another point is the disinfection of eelworm and fungoid infested houses. Spray them well in all exposed parts with formaldehyde solution, one part in 240 parts water, and soak all walls and groundwork parts with the one per cent. solution. This we advised to a large grower of Cucumbers for market, losing £1,000 last year from leaf spot (*Cercospora melonis*), and his silence is marked this year: for, like the lepers of old, few return to give thanks, even when cured. We thank you, therefore, all the more for your appreciative remarks, and assure you we are always ready to help our subscribers to the best of our ability.

#### Peach Shoots Diseased.

In answer to "R. F." the shoots that have been affected since they were about 6in long are suffering from mildew, a term given to the meal-like white patches that appear on young leaves and tender shoots, at first small, but which soon spread and run into each other. They thus form a thin white belt, both surfaces of the leaf and all those of the shoot more or less affected. The "meal" is due to the production of innumerable conidia (early stage or summer spores) of the fungus named *Rodosphaera oxycantha*, the specific name signifying that it commonly infests the Hawthorn. The young shoots of quickset hedges are often quite white-looking by its presence on the tender growths. The pest is, indeed, very common, attacking many wild plants belonging to Rosaceæ, and occurs on the Apple, Apricot, Cherry, Nectarine and Peach, Quince, and other Rosaceous plants under cultivation; it also occurs on species of *Vaccinium* and *Diospyros*.

Chains of conidia are first formed, and later in the season minute black ascigerous fruit appears; each perithecium contains a single ascus, and near its apex bears a cluster of almost erect appendages, with much-branched tips. If the fungus attacks full grown leaves but little injury is done; whereas, when quite young leaves and tender shoots are attacked, as generally is the case, the injury is often severe, the growth being crippled and the young wood practically ruined, especially in the case of Peach trees.

Royal George is very liable to attacks of the fungus, this variety of Peach often being infested, as in your instance, while other kinds growing alongside of it are quite free from the mildew. We do not think it is due, as you suspect, to bad root action, but to inherent susceptibility or tenderness of constitution, though lifting an affected tree somewhat mitigates the liability to attack for a time; but this is because the lifting tends to promote sturdier and more resistant growths.

The only effectual remedy is to cover the wall, though you do not say whether the trees are against that, with tiffany, or netting, and then the trees will not contract mildew, other conditions being favourable for the Peaches. Failing this, we should certainly discard the Royal George, and supplant by a variety or varieties that are not liable to mildew in the particular locality.

The mildew, however, is easily checked. It succumbs readily to sulphur, either in the form of flowers of sulphur or solutions of the sulphide. In applying the flowers of sulphur bellows should be used, and the first application should be made as soon as the young growth pushes, not deferring longer than the first appearance of the faintest white specks on the leaves, shoots, or young fruits, and repeating at intervals of ten days or a fortnight until the pest is annihilated. If you use sulphide of potassium (liver of sulphur), 1oz should first be dissolved in about a quart of hot water, and when dissolved diluted to 2gals with water in which 2oz of softsoap have been meanwhile dissolved, using boiling water, but allowing to become cool before adding the sulphide solution.

Well mixed, it is ready for use, and should be applied by means of a spraying apparatus. Treatment should commence early, in order to prevent or check the disease. If this is allowed to run its course, the fallen leaves, and even the affected wood, should be collected or cut off as applied to the first and latter respectively, and be burned: otherwise the ascigerous fruit on the leaves or the young wood will inoculate the trees the following season.

#### Familiar Fruits and their Origin.

A great many of the kinds of fruit now grown in England were introduced from Asia by the Romans. The Apricot was brought from Armenia, the Cherry from the northern parts of Asia Minor, the Pistachio tree and the Plum from Syria, the Peach and the Walnut from Persia, the Citron from Media, the Filbert from Pontus, the Chestnut from Catana, a town of Magnesia, and the Almond from various parts of Asia. The Pomegranate, according to some authors, came from Africa, according to others from the Island of Cyprus; the Quince from near Cydon, a town of Crete; while the Olive, the Fig, the Pear, and the Apple were all introduced from Greece. We learn from the "Capitulaires"

of Charlemagne, that almost all the fruits above mentioned were grown in the gardens of that monarch, and that even at that early period many varieties had been produced in the course of cultivation. Among them, however, we do not find the Reine Claude, or Green Gage, nor the Bon Chrétien Pear, a variety first presented by St. François de Paul to Louis XI. —("Leeds Mercury").

## A Selection of Acacias.

While the bulb and spring flowering shrubs are being ordered from the nurserymen, may it not be that the gorgeous Acacias are left out of mind. We recently had notes from the gardens of Tasmania, and when these came to hand we thought of the splendour of the Silver Wattle, the *Acacia dealbata*, whose fragrant and beautiful yellow showers of blossom are the most striking feature of that prosperous southern island in its spring-time. There the *Mimosa* (another of its names) grows 50ft and 60ft high, rather sparse in its growth, but plenteous in its floraison. And in our English greenhouse it is one of the best shrubs we have. Some of the most desirable for pot culture are the following:

*Acacia cordata* (1), a very distinct and graceful species, having long, slender, but slightly branching stems, densely clothed with leaves and flowers. The latter are in very small globular heads, creamy white. The leaves or phyllodes are cordate, angular, and with a tapering point.

*A. pulchella* (2) is one of the most beautiful of the Acacias, as it is extremely floriferous, with showy flowers. The plant is of spreading habit, with small pinnate leaves three-quarter inch long, the pinnæ narrow. The flowers are in globular heads, half-inch in diameter, bright golden yellow, and slightly fragrant. They are borne on slender peduncles, 1in long, solitary on the axils of the leaves, but produced very freely all over the plant.

*A. verticillata* (3), tall growing, of somewhat cylindrical habit, the dark foliage and stem contrasting with the soft yellow flowers. The leaves or phyllodes are half-inch long, very dark green, narrow, sharp, and arranged six or eight in a whorl. The flowers are in a dense spike 1in or more long, sulphur yellow, usually solitary, sometimes slightly branched at the base, fragrant.

*A. Drummondii* (4) is certainly one of the best, the flowers being borne in axillary spikes, drooping gracefully. In a good specimen, which is as difficult to get as most of the kinds are to keep from growing too much, this is one of the most handsome of spring flowering greenhouse plants, the chief points to be guarded against in its culture being over-potting and over-watering. It is also rather subject to attacks by red spider, which can be subdued by judicious yet efficient syringings.

*A. armata* (5) attains to a height of 6ft to 10ft or more, and forms a very handsome pyramid, its long annual growths gracefully arching being studded with solitary globular heads in March or April are very pleasing. If there is only room for one this may be given preference. By gentle forcing it may be had in flower from December. The foregoing five kinds are shown in the illustration.

*A. diffusa* has the flowers globular and usually twin, produced somewhat freely, the growths being diffusely procumbent. It attains to a height of about 3ft.

*A. cultriformis* is more a curiosity, the leaves being 8in to 10in long, knife-like, terminating with a hooked point. The flowers are in crowded heads, in terminal or axillary racemes, produced during spring. It attains a height of 6ft or more.

*A. olceifolia elegans* is very handsome, the heads of bloom disposed in racemes, the plants being of graceful habit, and the flowers are very bright. It is the *Acacia lunata* of the botanists.

*A. grandis* is considered to be a variety of *A. pulchella*, but rather freer in growth, though both are free enough, soon forming specimens of 10ft to 12ft high when the object is a pyramid, and the leading growths trained up. It flowers from February to May, the flowers being globular, very freely produced.

*A. longifolia magnifica* is a fine erect growing kind, the leaves being linear lanceolate, the flowers borne profusely in loose spikes from the axils of the leaves, and during the early spring months. It attains to the height of a dozen or more feet, but can be kept to six by judicious pruning, which it seems to flower all the better of, at least the sprays are longer and the flowers finer.

The species named are all for the greenhouse. We have not grown any of the stove species. White scale is the great enemy of Acacias. We know of no better remedy than applying methylated spirits carefully to the stems and other parts affected with a small brush, and the cleansing influence of rain when placed outdoors is exerted most beneficially on the plants towards autumn; indeed, the plants usually come in in splendid flowering condition.—B.

## Gardens Round Sheffield.

One can scarcely realise the immense growth of the demand for flowers during the last few years, the public taste and love for floral beauty having wonderfully developed, and to a great extent "supply" has created "demand," but in seeking the cause we generally find that some influence has contributed to the cultivation of popular appreciation of the florists' productions, and a visit to

### Messrs. Artindale & Sons'

establishment reveals the influence in Sheffield in this direction. In the Nether Green Nursery there is about six acres of herbaceous stuff, but, commencing with the plant houses, one is struck with a fine house of *Lilium Harrissi*. Here are about 2,000 just flowering looking remarkably well; about 5,000 are grown, and 250 had been cut on the day of our visit. Of *Caladiums* there is a valuable collection. Noticeable, too, were some lovely pieces of *Abutilons*. *Kalanchoe flammea*, a nice stock; fine pieces of *Dracæna* (*Cordylina*) *Sanderiana*; also *D. indivisa*, *Godseffiana*, &c. There are some very fine *Aralia elegantissima*, *gracillimum*, and *Veitchi*, *Cocos Weddelliana*, &c. The noble *Croton* house is worthy of special notice, because there are few "trade" places where so good a collection can be seen, perhaps from the fact that the firm grows for exhibition. *Pandanus Veitchi*, *Acalypha macrophylla*, *Sanderiana*, and *musaica*, *Ficus repens variegata*, *Alocasias*, *Marantas*, and *Ixoras* are all well in evidence. Some nice plants of *Nidulariums* (one in flower), *Dieffenbachias*, *Eulalia japonica* (grand plants for grouping), *Marantas Veitchi*, *zebrina*, and *Massangeana*, all looked well. Again we enter a house where *Abutilon Thompsoni* is doing well, also *Bambusas* in variety, *Dracenas* and *Asparagus deflexus*, *A. plumosus*, *A. Sprengeri*, and *tenuissimus* are largely grown; indeed, *Sprengeri* can be seen growing very luxuriantly all through the establishment. Here, too, is a quantity of *Begonia Gloire de Lorraine* and the *Turnford Hall* variety, and an improved variety not yet in commerce of a stronger habit and larger flowers than *Gloire de Lorraine*.

The first batch of 2,000 *Tuberoses* are in flower, and then we come to a *Carnation* house 90ft. long, full of "Mals" from end to end, of all the leading and newest varieties; and later we saw another house 90ft. long, full of border varieties, including a large quantity of *Childe Harold* and *Heather Bell*. There are growing here about 10,000 *Carnations* in pots, and Mr. Egginton, who is in charge, certainly deserves credit for their remarkably good condition. In the *Palm* house *Kentias*, *Phoenix*, *Latantias*, *Geonomas*, *Cocos*, &c., demand notice, and on a wall grows *Asparagus Sprengeri* in great profusion.

In another house are *Camellias*, *Roses* in pots, some fine *Aspidistras*, and a *Hoya* on the wall, showing a profusion of flowers. An interesting item is a robin's nest built in the soil of a hanging *Musk* basket. It contained five eggs, and we were informed that one of the houses is usually chosen for nesting.

In the next house was another batch of 1,000 *Tuberoses*, also *Marguerites*, *Hydrangeas* *Thomas Hogg* and *japonica*; new yellow *Calla* (*Richardia Elliottiana*), *Eucalyptus*, &c. In another house was a large stock of early flowering *Chrysanthemums*, including over 1,000 *Horace Martin*, and such other varieties as *Crimson Marie Massee*, *Godfrey's Pet*, *White Quintus*, &c. Then there are *Gloxinias*, *Begonias*, *Amaryllis*, *Odontoglossums*, *Cattleyas*, *Cœlogyues*, *Cypripediums*, *Calanthe Veitchi*, and *Oncidium*s.

Coming to *Roses*, the firm has about 10,000 of all the varieties worth growing, and though kept back by the cold season they looked promising. A batch of *Lord Penzance* varieties of *Sweet Briars* were also noticeable. Of *Spanish Iris*, there are about 50,000 growing here. *Gaillardia grandiflora* is also in quantity, and there are six large nursery beds of *Iceland Poppies*. Passing on one sees that large quantities of *Narcissus* have been grown, and all the choicest hardy plants. Coming to smaller things, we notice a nice strain of *Auriculas*, of which there are some 10,000; and of *Pansies* there are also thousands of very special merit: they were really very fine. Then there are about 20,000 *Polyanthus* of a very good strain. Of *Sweet Peas* all the leading varieties and colours are grown for cutting, and there are hundreds of yards of them. *Lilies* make another big feature, and hundreds of *Lilium auratum* are in pots. *Dahlias* are by no means neglected, about 5,000 being here. Mr. Egginton has been in charge here for six and a half years, and, therefore, knows what to grow, and when and how to grow it. He prides himself on his *Carnations*, and has helped the firm to victory on several occasions. He was previously with Mr. Lion, of Stanmore, Middlesex; at Hampton Court Palace two years; and five and a half years with Messrs. Hewitt, of Birmingham. At Messrs. Artindale's other nursery, at Ecclesall Road, there is much forced material. Mr. Willingale is in charge here, having been with the firm some years.

### THE FLOWER TRADE.

Messrs. Artindale's retail shop in High Street is always up to date with cut flowers and fruit of the choicest kinds. It is the *dépôt par excellence* for everything pertaining to flowers in Sheffield. In the Market Hall they have plants and every

description of design in flowers; from here are despatched daily every conceivable device in flowers, wreaths, anchors, wedding bouquets, presentation bouquets, &c. In the Castleford's Market is the wholesale department, and here we found Mr. John Artindale, the chief of the firm, genial, as always, and shrewd, yet unassuming; he has by polite attention, aptitude, and ability built up a business of which he may be justly proud. Gold and silver medals, and other premier honours, have been secured at the principal shows for floral devices and groups. We gathered from Mr. Artindale that in addition to their own productions they received large consignments daily from all parts. From Seilly comes early *Narcissus*; from Lincolnshire, *Daffodils*; from Guernsey, *Grapes* and *Tomatoes*; from November to April, large quantities of *Chrysanthemums*, &c., come from Norwich, Bedford, and the Channel Islands. Through the summertime there is a large supply of local produce; from Worthing come *Grapes*, and also *Grapes* and *Tomatoes* from all parts of England and Scotland, while they have a daily supply from the south of France of flowers in variety.

Asked as to the volume of trade done, we learnt that the trade had greatly increased, but the prices compared very unfavourably with three or four years ago to the growers. In one month Messrs. Artindale paid the Midland Company £60 for carriage. This will give some idea of the volume of trade done by the firm. Mr. Artindale has lately returned from the Continent, and we asked his views as to the trade. He is of opinion that land in Lincolnshire is superior for *Daffodils*, *Narcissus*, and *Tulips*, and that if the growers went seriously into the matter, they would have the advantage of the Dutch growers in that land was cheaper. Land in Holland is highly rented, but they beat us for labour, men working more hours at a lower rate of wages. In Belgium, labour costs very much less than at home, but the English gardener is not one whit behind them in his ability for growing stuff, the chief advantage in competition, therefore, being labour.—W. L.

## Orchard Houses.

### The Lean-to.

I will suppose (says the late Mr. Rivers in his book, "The Orchard House"), an orchard house 30ft long is required. A ground-plan 30ft long and 12ft 6in wide should be marked out. Then six posts of oak or good yellow deal, 5in by 3in, and from 10ft to 11ft 6in in length; or of larch-poles 16in in girth, cut in two and the flat sides placed outwards, must be firmly fixed 2ft in the ground: the ground ends, before fixing, should be charred 2ft 6in from the bottom, and then have a coat of boiling coal-tar, which adds much to their durability. They will form the back line of posts, standing 9ft 6in in height from the surface of the

SECTION OF THE LEAN-TO ORCHARD HOUSE.

ground. For the front wall six posts of the same thickness, 6ft 6in long, must be firmly fixed 18 inches in the ground, so that they stand 5ft out. Two posts will be required at each end (at one end, if only one door is wanted); these will form the door-posts. On these posts, both at front and back, must be nailed a plate 4in by 3in, on which the rafters are to rest; the posts are thus arranged in two lines.

The rafters must be 14ft long. A 9-inch deal—i.e., a deal 9in wide and 3in thick, will make four, each 4½in by 1½, or nearly so. These are light, strong, and economical. The rebate should be half an inch wide for the glass to rest on (not too much for glass 20in in width). I find that scarcely any breakage takes place from frost owing to the large pieces being elastic; 16-oz glass answers, the extra cost of 21-oz glass is, however, worth incurring.

On and outside the back posts three-quarter-inch, well-seasoned deal boards should be nailed. In the back wall thus formed sliding shutters in grooves 3ft by 1ft must be fixed to act as ventilators—two close to the roof and two 18in from the surface of the ground (the lower shutters in the back wall must

always be on a level with the ventilating shutter in front); if two more be added to the right and left of the lower shutters, all the better: in summer it is impossible to give too much air.

The front and ends (except the doorway) must also have three-quarter-inch boards nailed on outside the posts; one of them, the

1.—SMALL SPAN-ROOFED ORCHARD HOUSE.

a, Iron socket; b, boards to the ground; c, ventilating shutters; d, glass 18 inches wide.

upper one in front, to be on hinges, so as to let down the whole length of the house; this, with the back shutters, when all are open in hot weather, will ventilate thoroughly.

Where there is a brick or other wall to serve as a back wall it may be built against it with a great saving in expense; but as sliding shutters cannot conveniently be let into such walls ventilators may be made at the top of the slope of the roof by having every alternate square fixed in a wooden frame, which should be run in a groove and be drawn up and let down with a cord, to which an iron weight should be attached to keep the sliding sash in place; with this the ventilators can be regulated at pleasure. An equally or more convenient mode of ventilating at the top of the sloping roof is by a continuous shutter of wood in 10-ft lengths, on hinges opening upwards, raised by a line and pulley; this should be 1ft wide at least. In a house not more than 10ft wide this mode of ventilating at front and at the top of the roof will do very well; but in lean-to houses of greater width it is necessary to have shutters in the back wall on a level with those in front, so that two currents of air may meet and "stir up" all the air in the house.

#### Span-roofed Orchard House.

I now give a description of my favourite sort of orchard house, the span-roofed. In houses of this kind Peaches and Nectarines do not, perhaps, ripen so early as in lean-to houses, but quite as early as on walls. Owing to their being detached they can be more thoroughly ventilated, and the fruit from them is generally piquant in flavour.

In the north of England and all cold or moist districts, of which England contains too many, in the Highlands, and in the cold, stormy climates of the north of either Scotland or Ireland, it will perhaps be quite necessary to introduce hot-water pipes into houses in which Peaches, Nectarines, and Apricots are to be cultivated, not to force them, but to insure their ripening properly.

Height of my small span-roofed house at sides, 6ft; height to ridge, 10ft; width, 14ft. The roof rests on oak posts 5in by 3in, 5ft apart; but I now find deal posts let into iron sockets are

LARGE SPAN-ROOFED ORCHARD HOUSE.

preferable to any other mode of building orchard houses of wood, the usual way of building with brick foundations and sills may be adopted.

The rafters are 20in apart; the roof is glazed with 21-oz glass, in pieces 20in by 15in. The two ends are glazed down to the lower edges of the glass at the sides. The rafters are 3in by 1½in, and are tied together at the apex of the roof by a light, flat iron tie screwed to every fourth rafter.

The path is down the centre, and the rows of trees may be

placed on each border 3ft from stem to stem, so that the sun may shine on every leaf. This is most essential; for I have occasionally had some of my Peaches deficient in flavour, and on examination have always found the trees too much crowded, so as to shade each other. In these small span-roofed houses the trees placed as above form a charming avenue, and are looked down upon by the cultivator, so that every leaf and fruit is seen.

The small span-roofed house referred to will be found an agreeable and economic structure; but large gardens require large houses, and for these the following construction may be confidently recommended:—A cheap, large, span-roofed house 20ft wide and 12ft to 13ft in height to the ridge may be built after the following manner:—Oak posts or deal posts in cast-iron sockets 6in by 4, and 9ft long, should be placed flatwise, so as to stand 5 to 5½ft clear out of the ground and the soil well rammed round them, or concrete poured in so that they stand firmly. These posts should stand in two rows 20ft apart, 6ft apart in the rows. On them should be nailed the plates, to receive the end of the rafters, which may be nailed on to them. These plates should be 4in by 3. The rafters should be 4½in by 1½, and nailed to the ridge-board at the apex of the roof, which should be 12ft from the surface. The ridge-board should be 7in. by 1½. The rafters must be placed 20in asunder. The sides and ends of the house should be formed of three-quarter-inch boards; for ventilation a shutter 18in wide made into 15-ft lengths and opening on hinges downwards, the lower edge 18in from the ground, should be placed on each side: these are for the admission of cool air. For the egress of the heated air an aperture 1ft deep should be made at each end just under the apex of the roof. To this a shutter on hinges should be fixed, and this should be kept open from the beginning of June till the end of September. The roof should be supported, and kept from going out either by light "collar-beams" of wood to every sixth rafter, by iron rods so disposed as to tie the roof securely, or, best of all, by two rows

2.—END ELEVATION OF AN ORCHARD HOUSE 24 FEET WIDE.

a, Glazed shutters on hinges, opening downwards; b, sash for egress of heated air, opening downwards.

of iron pillars formed of 2in gas pipes, which are very cheap, 6ft from each side; the lower ends placed in the ground, and let into a small square of brickwork and cement, the upper ends let into the purlin. These pillars should be about 10ft apart.

It will be seen from this description that a house built after this method is a plain but useful structure, for its sides, ends, and doors (there should be one at each end in the centre) are all of boards, and its roof only of glass. Nevertheless, this description of orchard house will give fruit in as great abundance and of as fine a flavour as a house built ornamentally and at a great expense.

In June, 1860, a house was built here, which for strength, cheapness and lightness of construction is both eligible and agreeable (see figs. 1 and 2). It differs from the houses formerly built and recommended in having no raised brick borders, by which a considerable saving is effected. No inconvenience will arise from the trees standing on the ground level, for it is only necessary to cultivate the trees as pyramids or half-standards for the central border, and as dwarfs with stems a foot taller than usual for the side borders. It is 100ft long, 24ft wide, 12ft high in the centre, and 5ft 3in at the sides. Sides and ends are glass, and on each side and at both ends is a glazed shutter 18in wide, the lower edge 18in from the ground on edges opening downwards for low lateral ventilation, and below that glass to the ground. At each end, just under the gable of the roof, are openings 3ft in depth, to which sashes are fixed; these are to be open all the summer to let off the hot air, and this is all the top ventilation necessary.

The roof, which is formed with light rafters 3½in by 1½, is supported on each side by seven light pillars 1½in in diameter fixed to a bar of iron, which is let into the rafters. Each row of pillars (f) is 6ft from the sides of the house, so that there is a border on each side 6ft wide and an area in the centre 12ft wide.

In addition to the ventilation above described, Mr. Rivers adopted with great success a simple plan he devised of admitting air through underground drain pipes, one end of these air ducts passing under the sill to the outside, the other rising through the floor about the centre of the house, or where required, and covered with a movable lid for regulating the ingress of the air. Mr. Rivers attached great importance to this method, as in cold

weather and when forcing the side ventilators cannot be safely opened. Nothing could surpass the healthiness of the trees in a large house (from which Peaches were being sent to market early in May) in which this underground system of ventilation was mainly relied on for keeping the air sweet to the ground. The trees referred to were in pots. Pyramid and standard trees occupy the central border in the larger houses.

## Societies.

### R.H.S. Scientific Committee, August 18th.

Present: Dr. M. C. Cooke (in the chair); Messrs. Holmes, Odell, Gordon, Michael, Saunders, Bowles, Douglas, Worsley, and Dr. Masters.

*Orites excelsa*.—Mr. Holmes showed a specimen of the bark of this Australian Protead, remarkable for containing aluminium succinate. The nearly allied *Grevillea* contains no aluminium.

*Rubus rosafolius*.—Mr. Odell showed flowers and fruit of this *Rubus*, which has pinnate foliage of a light green colour, white flowers, and scarlet fruit.

*Proliferous Cucumber*.—Dr. Masters showed a remarkable specimen, in which from the axil of the remains of the sepals on the top of one fruit a second one had sprung, longer than the parent. This was from a specimen probably akin to those showing remarkable outgrowths of flowers from the axial part of the fruit, exhibited on a former occasion.

*Hymenocallis Harrisiana*.—Mr. Bliss sent bulbiform seeds of this plant in process of germination, which were referred to Dr. Rendle for examination and report.

*Viola disease*.—Specimens sent by Mr. Bacon were referred to Dr. Cooke for examination and report.

*Apple tree scorched*.—A further letter was read from Mr. Dowson relating to Apple branches shown at the last meeting. The dead bark does not peel off on the south side only, as it would do from sun-scorch, to which the mischief has been attributed, but on the north side also. Lightning was suggested as the probable source of injury, as no fungus could be detected.

*Vine leaves discoloured*.—Leaves were sent from Worthing affected with red spider. There were traces of honeydew and of smut fungus (*Capnodium*).

*Cucumber scale*.—Dr. Cooke showed further specimens of Cucumber affected with *Cladosporium* scabies, which will shortly be illustrated in the "Gardeners' Chronicle." A close atmosphere is favourable to the spread of these fungi, whilst a current of air is prejudicial to them. This has been observed by growers in the case of Tomatoes affected with *Cladosporium*.

*Peas*.—Mr. Worsley showed specimens of late Peas rotting near the base, whilst the foliage above turns brown and shrivels. This condition is very common this autumn, and is probably due to excessive moisture at the root.

### Saltley, near Birmingham.

This society has survived twenty-six annual floral fêtes, and on the 17th inst. made a success of the twenty-seventh of the series. The energetic secretary (Mr. R. T. Willmott) remarked that so far as his own recollection was concerned, the show had never been finer.

**SPECIMEN PLANTS.**—In the first prize collection, staged by Mr. Oliver Brasier, gardener to E. Martineau, Esq., Edgbaston, all were excellent. Mr. C. E. Gwyther, for second, had fine examples. Messrs. Perkins and Sons, Coventry, as might be expected, were to the fore with a very good set of twenty-four Roses.

Cactus Dahlias vied with the Roses, and Messrs. Perkins were to the fore with Ibis, J. Weir Fife, Lottie Deans, Cornucopia, H. F. Robertson, Florodora, and Ruby; the second and third prizes fell respectively to Messrs. H. J. Horne and R. Summers. For Phloxes, Messrs. H. J. Horne, J. M. Clewer, and E. J. Byrne were the respective winners. For twelve herbaceous cut flowers, Mr. H. J. Horne led with a very good assortment. Messrs. R. S. Austin and Co., second. Stocks were exceedingly well staged by Messrs. H. J. Horne, G. J. Byrne, and Townson Bros.; Gladioli by Mr. R. Summers and Messrs. Austin and Co.; Carnations were well staged by Mr. White, Mr. J. W. Smart, and Mr. G. J. Byrne.

Vegetables were numerous and well exhibited throughout the whole classes, the competition being keen both in the collections and single dish classes. Messrs. Webb and Sons, Wordsley, Messrs. Sutton and Sons, Reading, Messrs. Yates and Co., Birmingham, Messrs. Austin and Co., Gravelly Hill, and Messrs. J. G. Jester and Son offered prizes for collections.—G.

### Shirley, Millbrook, and Freemantle.

This horticultural society held its thirty-eighth annual show at Whithedwood Park on August 19. The show generally was a distinct advance on last year, but more particularly in the plant tent. Specimen plants were better than for some years, the best six being shown by Mr. E. Wills. Miss Todd (gardener, W. Peel came second. For four plants (confined to the district) General Nisbett took first.

Groups were much better than last year. In the open class Miss Todd secured first with a very tastefully arranged lot of suitable plants, Mr. Wills being a close second, and B. Ladhams, Ltd., third. There were a good number of entries, but they were mostly in the groups confined to the district. General Nisbett, who took first, was a long way the best.

Pelargoniums were largely shown, but we have seen better at these shows. The best lot of doubles came from Mr. R. C. Bassett; and the first for singles went to Mr. H. Jupe. Fuchsias were also poorly shown, those exhibited by Col. Sinkins (gardener, Mr. E. Wilcox) being a long way in front of any of the others. Ferns were a very good class considering the cash amount of the prizes, the first for six going to A. Maple, and for four to Mr. Nelson Ward. Coleus and Begonias were also largely shown. For the first-named Mr. Nelson Ward took first, and for the latter Mr. J. W. Fleming was first.

Cut flowers were the feature of the show; we do not remember seeing a better collection at any previous show of this society. As might be expected in the neighbourhood of the Shirley Nurseries, herbaceous flowers were much in evidence. Sweet Peas were also shown largely and well, and the same applies to Dahlias, the Cactus varieties being especially bright and attractive. The first prize in each of the above was secured as follows: hardy garden flowers, B. Ladhams, Ltd.; Sweet Peas, Mr. A. Searle, beating Mr. Breadmore; Fancy or Show Dahlias, Mr. Cozens; Cactus do., in bunches, E. Edwards.

Asters were very good, both the Comet and Victoria kinds, the first prizes being taken by C. W. Breadmore and A. Maple respectively. For bouquets, both ball and bridal, Miss Wills was an easy first.

Fruit was sparingly shown, but the Grapes, Peaches, and collection of fruit shown by Mr. J. W. Fleming, of Chilworth Manor (gardener, W. Mitchell), were good enough for any show, and secured easy firsts in every class. Mr. H. E. Sugden, of the same neighbourhood (gardener, E. Valentine), was second in each class.

Vegetables are always largely shown at Shirley. We have seen the open class for collection of six dishes better filled, but Mr. Mitchell's first prize lot would have taken a lot of beating anywhere. For each of the single dishes there were, we should think, a record entry. Cottagers also came out very strong, their exhibits of plants, cut flowers, and vegetables being not only numerous, but most creditable in quality. The show was materially assisted by a number of trade exhibits, the principal being that of W. H. Rogers and Son, Ltd., with Roses, Dahlias, &c. C. W. Breadmore, Winchester, had a fine collection of Sweet Peas, and B. Ladhams, Ltd., occupied some 200 square feet at the end of the tent. Their exhibit comprised hardy hybrids, Lobelias, a series of varieties obtained by crossing and selection from *L. syphilitica*; Percy Ladhams is rosy carmine with green leaves, and Magnificent is crimson. These are the best of eighteen varieties. Coreopsis Eldorado (grand flowers, 4in across), Chrysanthemum maximum Monarch, faultless flowers of immense size and great purity; Pink Mrs. Mouland, of the perpetual race; Heliopsis B. Ladhams, a great advance on Major; Gaillardias (a very fine bank of Oculata varieties) were amongst the subjects included. At the time of leaving the show (four o'clock) a large number of visitors were coming in.—F.

### Trowbridge, August 19th.

For fifty-four consecutive years Trowbridge has supported its annual flower show, and the popularity of the fixture may be fairly gauged by the extent of patronage afforded, and the large number of entries in the several sections of the show. It is computed that over 12,000 persons attended the show during the afternoon, and that 5,000 of that number passed the gates in a space of fifty minutes. The extent and quality of the exhibition as a whole was unanimously pronounced excellent, and provided for many an agreeable surprise, when the adverse nature of the summer has been remembered. Flowers, vegetables, and fruit seemed to show no ill effects of the frowning elements.

Trained stove and greenhouse plants in four classes were well contested by local competitors, Mr. H. Matthews, gardener to W. J. Mann, Esq., Highfield, Trowbridge, winning easily in three out of the four classes which require nine, six, three, and a single specimen respectively. In the first, exceptionally finely grown and freely flowered plants of *Clerodendron Balfourianum*, *Bougainvillea glabra*, *Ixora Pilgrimi*, *Allamanda nobilis*, *Ixora amabilis*, and a huge *Rondeletia speciosa* major were staged. Other conspicuous plants in other classes were *Ixora coccinea*, *Erica Eweriana elegans*, *E. antonia turbinalis*, E.

Austiniana, and Allamanda grandiflora. They were an exceptionally finely grown lot of plants, emanating from one comparatively small garden. Mr. G. Tucker won second prizes for nine and six specimens, and first for a beautifully flowered Stephanotis. Mr. Peters, gardener to J. Kemp, Esq., was third.

Fuchsias, always a fine feature, were very good, though not equal to some shows of the past. Mr. Tucker, Hilperton Marsh, and Mr. H. Pocock staging well in two classes. Groups of miscellaneous plants were fewer in number, though the quality was good. Mr. Helps, gardener to E. H. Atchley, Esq., Rodwell Hall, Trowbridge, won with the larger exhibit, and Mr. Peters the smaller group, both having bright arrangements of flower and foliage. Messrs. Cray and Sons, Frome, were second.

With nine specimen foliage plants Mr. H. Matthews was first; Mr. Strugnell, gardener to Col. Vivian, Rood Ashton, second; and Mr. Helps third. Ferns, twelve in number, were keenly contested, Mr. Tucker, the champion of so many fights, having to be content with third position. A. P. Stancomb, Esq., president of the society, won premier place, his Dicksonia, Microlepia hirta cristata, and Davallia Mooreana being very good. Messrs. Stokes and Son, for second prize, staged really good fresh plants, including Gleichenia rupestris, Chiliensis glauca, Asplenium nidus, Adiantum Williamsi, and Leucostegia immersa. Lilioms, table plants, trained Zonal Pelargoniums, Gloxinias, and Begonias contributed both variety and colour from many competitors.

Roses made a remarkable display, the flowers so fresh and bright. With twelve triplets Mr. Jno. Mattock, Oxford, won from Messrs. Perkins, of Coventry, and Townsend and Sons, Worcester. He had Bessie Brown, Mrs. J. Laing, Mildred Grant, White M. Cochet, Mrs. Mawley, Chas. Darwin, and Alfred Colomb in very good form. In Messrs. Perkins' stand was the pretty, and, indeed, striking, new Rose, Madame Ravary. Messrs. Perkins took the lead with thirty-six singles with beautiful blooms of A. K. Williams, Killarney, Mrs. W. J. Grant, Horace Vernet, Reynolds Hole, and Duchesse de Morny. Messrs. Townsend and Mattock closely followed. Mr. Mattock again led with twenty-four varieties, Madame Verdier, Star of Waltham, J. B. M. Camm, and Papa Lambert being the most striking flowers. Messrs. Townsend and Perkins taking the remaining prizes. Messrs. Perkins won with twelve varieties with a very nice stand. Garden Roses is a newly introduced class at Trowbridge, and on this occasion made a fine display. The Messrs. Cooling, of Bath, outdistanced their rivals, Messrs. Mattock and Townsend, with a bright and varied collection that was generally admired.

Dahlias were both good and numerous. Messrs. Cray and Sons, Frome, with their usual success, secured four of the leading prizes, Messrs. J. Walker, Thame; G. Humphries, Chippenham; T. Carr, Tiverton; and A. L. Gray, Bath, also successfully competing. Decorated tables, bouquets, vases, &c., command a deal of enthusiastic rivalry, and particularly among lady competitors. Mrs. Hale, Warminster, was given the first prize for her table, which was tastefully treated with bronzy shaded flowers; Messrs. Cole and Son, Bath, second; Mrs. Woodland, Frome, third. For a vase of cut flowers Mr. W. H. Coles, Bristol, defeated Mrs. Hale, and for a combination of fruit and flowers in a vase or epergne Messrs. Cole and Son, Mrs. Woodland, and Mr. Strugnell won in a spirited competition. The Frome Fruit and Flower Co. won with shower bouquets and with buttonholes. Messrs. Cole and Son, Davis and Son, Swindon, and W. H. Coles, Bristol, taking the prizes, also for presentation and Sweet Pea bouquets.

Fruit made a good display, though the competition was not so keen as in years of greater plenty. Two competed with a collection of ten dishes. Mr. Jones, of Bath, was first, and Mr. Strugnell second. The Marquis de Lavellette (gardener, Mr. Oliver), Market Lavington, led with six dishes in a much keener contest. He had a fine dish of St. Antoine de Padoue Strawberries, well coloured Muscat Grapes, and Downton Nectarines as his best dishes. Mr. Strugnell was second, and Mr. Ackland, gardener to A. G. Hayman, Esq., third. Several others competed.

Mr. Taylor, gardener to A. R. Baily, Esq., Frome, won with Muscats and any other white variety, staging nicely finished Foster's Seedling. Mr. Strugnell won with black Grapes and Cherries, the latter very large in size. Mr. Clack, gardener to C. E. Colston, Esq., M.P., won with Nectarines; Mr. Fisher, Bath, Green Gages; Plums, Mr. Cowdray, Steeple Ashton; Peaches, Mr. Helps, with finely coloured Exquisite. Apples, both dessert and culinary, were numerous and good. Mr. E. Fisher had well coloured Beauty of Bath as his dessert, and Mr. J. Ayres, Wells, staged excellent, and, for the season, really massive fruits of culinary varieties for first prize.

Vegetables showed unmistakeable evidence of the benefit of frequent rains, and but little trace of spring frost influences. Potatoes were excellent in the open amateur and cottage section of the show; Celery, Peas, Broad and Runner Beans were simply splendid. So, too, were Cucumbers, Cauliflowers, Cabbages, and Turnips, both individually and collectively, and were

finely grown. Names are so numerous, representing the winning section, that space forbids repetition. Mr. Snailum is the courteous and painstaking secretary, and is assisted by a large and influential committee, whose work redounds with the highest credit on all concerned.—A.

### Chard, Somerset, August 20th.

The place of exhibition was the Grammar School Playfield, and the day being wet, it soon became sodden and sloppy. The number of exhibits was somewhat over that of last year, and Mr. T. Jennings, the assistant secretary, was very willing to give help. The Mayor of Chard, Mr. S. H. Denning, and the Committee, have done capital service. The judges were Messrs. J. Crooks, gardener at Forder Abbey; W. J. Connolly, gardener, Rhodes Hill, Uplyme; S. Lyon, gardener, Cricket St. Thomas; and Mr. Bailey, Rousdon. Prominent exhibitors were Col. W. A. Sanford, of Nynhead Court (gardener, Mr. S. Kidley); Major Aldworth, of West Coker (gardener, Mr. A. Burton); Major Gifford, of Oaklands, Chard (gardener, Mr. J. Cousins); Mr. J. Wyley, of Ashill (gardener, Mr. Greening); and Mr. A. D. Paul, of Snowdon Hill House, Chard (gardener, Mr. G. Horner), who secured between them many prizes.—X.

### Devon and Exeter Summer Show.

Fine weather prevailed. Messrs. Veitch and Son, of the Royal Nurseries, Exeter, had a stand 45ft long, having a background of choice Bamboos, Palms, and Lilies. Some new plants were here for the first time. Among them were a Golden Beech, Lonicera Hildebrandti, a new yellow Honeysuckle; Coriaria terminalis, with long clusters of golden yellow fruits; Tamarix aestivalis, light feathery pink flower; Polygonum baldschuanicum; and Corydalis thalictrifolia. Among others were Kalanchoe flammea, Beaufortia splendens (vermilion red, resembling Bottle-brush), Lobelia Cavanillesi, and Gerbera Jamesoni. Sweet Peas were also staged.

Mr. W. J. Godfrey, of Exmouth, occupied a large place and staged very clean stuff. What Zonals Mr. Godfrey exhibited! comprising several novelties. He had a background of Abutilon Savitzi, Bamboos, Stephanotis, a greenhouse Solanum, and three new Fuchsias.

Messrs. Curtis, Sanford, and Company, of the Devon Rosery and Fruit Farm, Torquay, brought good fruit and hundreds of lovely Roses. The Apples were fine for this year. Among the collection were Lord Suffield, New Hawthornden, Stirling Castle, Yorkshire Beauty, and Duchess of Oldenburg. The table Apples included Gladstone, Lady Sudeley, and Beauty of Bath.

Messrs. Jarman, of Chard, had a wonderful collection of Dahlias. Mr. W. B. Smale, of Torquay, also showed fine Dahlias, some of which he has raised.

OPEN COMPETITION.—SHOW AND FANCY.—1, Jarman and Co.; 2, W. B. Smale. Cactus var., double—1, W. B. Smale; 2, W. Tuplin and Son, Newton Abbot. Messrs. Bird led, and Tuplin and Son, second, with Gladiolus; and Messrs. Jarman and Son, and W. A. Gale, with Roses.

Mr. G. Lock's table decorations were greatly admired, and came first; Mr. O. Burton second. For twelve stove and greenhouse plants: First, W. Brock, Esq. (gardener, Mr. W. Rowland); second, Col. Sanford, Nynhead Court (gardener, Mr. S. Kidley). Six ditto: First, W. Brock. Six stove and greenhouse Ferns: First, W. Brock; second, J. H. Ley, Trehill (gardener, Mr. J. S. Harding); third, Mrs. Hearn, St. Thomas. Group of plants for effect: First, W. Brock, with a light and pleasing arrangement. Mr. O. Burton (a coming decorator) was second. For a group in class II., Mr. W. R. Baker, gardener to W. F. Toring, Esq., Knightleys, Exeter, led with a very lovely arrangement.

In Dahlias the first prize was not given, Mr. Gale taking second. Twelve Dahlias. J. Copp, Teignmouth. Six ditto: Capt. Radcliffe, Alphington (gardener, Mr. E. Rowe). Roses: First, Sir D. D. King; second, T. Knapman. Garden Roses: T. Knapman. Asters: O. Burton; second, Capt. Radcliffe; third, J. H. Ley. Sweet Peas: First, J. H. Ley; second, T. Knapman; third, Mrs. L. C. Webber, Incedon. Annuals, also herbaceous perennials: First, Capt. Radcliffe. Carnations: First, Mrs. L. C. Weber, Incedon.

For a collection of eight dishes of fruit, Sir John Shelley led; second, Col. Sanford. Ditto five dishes: Sir J. Ferguson-Davie, Creedy Park, Crediton (gardener, Mr. W. H. Seward); second, Rev. A. W. Hamilton-Gell, Winslade (gardener, Mr. Barnes). Black Hamburgh Grapes: First, J. F. G. Bannatyne, Esq., Haldon House (gardener, Mr. Ellicott). Muscat of Alexandria Grapes: First, Rev. A. W. Hamilton-Gell. Madresfield Court: First, Rev. H. Clerk, Exmouth (Mr. T. H. Delve, gardener). Buckland Sweetwater: Second, Admiral Parker.

VEGETABLES.—Collection of twelve kinds: First, Sir John Shelley; second, Mr. W. R. Mairs had Intermediate Carrot, Renton Monarch Leek, Ailsa Craig Onion, Veitch's Autumn Giant Cauliflower, and Red Globe Turnip in his lot. Collection of six kinds, Sir D. D. King. The vegetables were fine in nearly every class.

The whole show deserved a large attendance. Exeter seemed full of visitors, and the Devonshire Regimental Band did not disappoint them, judging by the crowded condition of space near the band-stand. Friday was a day of real pleasure to thousands of Devonians and others.—X.

### Royal Horticultural of Perthshire.

The annual horticultural exhibition of the society (now in its ninety-eighth year) was held near the historic battleground of the Clans Chattan and Kay, fought in 1396, and so graphically portrayed by Sir Walter Scott in his "Fair Maid of Perth." The North Inch, the scene of this battle, is one of Perth's public parks, and here battles of another and peaceful character now take place. One well known competitor was overheard to say he had fought more battles on the North Inch than ever was fought by Gow-Chrom (a noted combatant in the clan battle already referred to). The competitor alluded to is Mr. John Leslie, Pitcullen, who has competed for eighteen consecutive years at Perth shows, always with success, and we were pleased to see him still able to hold his own against all comers.

Beautiful stands of Roses were set up, the quality being exceedingly good, Messrs. W. and R. Ferguson, Dunfermline, gaining the coveted award. Messrs. Croll, Dundee, took second place. A fine bank of herbaceous cut blooms was set up by Mr. Wm. Farquharson, Perth. Achillea The Pearl, Monarda rosea, Helianthus pumilus, Scabiosa caucasica, and a number of varieties of Phloxes being noteworthy.

Messrs. Storrie and Storrie, Dundee, had a very interesting table, the background of which was composed of Apple trees in pots, Humeas, Eucalyptus, Ficus, &c.; while groups of Celosias, Cockscorns, tuberous Begonias, and Streptocarpus added brightness. The Streptocarpus were exceptionally fine, having large flowers in many colours. Dishes of Gooseberries in variety, Raspberries, Currants, and Loganberries all contributed to make the group one of great interest.

Mr. Wm. Brown, Hatton Nurseries, Perth, arranged a table of single and double Begonias in endless variety. Dickson and Turnbull, Perth, had a similar arrangement to the foregoing. Mr. John Crichton, florist, Perth, had a beautiful display of floral devices, wreaths, and crosses.

At one end of the large tent Messrs. Alexander and Brown, Perth, put up an imposing exhibit, with a large Kentia for a centre, surrounded with a nice selection of other useful house plants, interspersed with Sweet Peas, Poppies, Cornflowers, Tuberoses, &c.

In the competitive section Mr. Wm. Brown won premier position for a table of plants with a tastefully arranged group on a groundwork of Selaginella. Leslie Brothers were second. For a circular group Mr. Leslie, gardener at Pitcullen, with a very tidy group, secured first place, closely followed by his sons, Leslie Bros., with a heavier arrangement. For a table of plants, open to gardeners, Mr. Margach, gardener to P. W. Campbell, Esq., Muirtonbank, gained the premier award, highly coloured Crotons being prominent in this table. Mr. Leslie was second with a better arranged table, but lacking in brightness.

Messrs. Milne, Huntingtower; Leslie, Pitcullen; and Lowe, of Balhousie Castle, were the only competitors for a table of cut flowers, and gained the prizes in the order named.

For specimen foliage plants Mr. Common, Moncrieffe, led the way; while for flowering plants Mr. Leslie secured first place. Mr. Stenning won for six Ferns, and Begonias, Coleus, Liliums, &c., were largely shown, and all in fairly good condition.

Sweet Peas made a very attractive exhibit, no fewer than eighty-four vases being set up, all of which were of exceptionally high order. Mr. James Kennedy, Moness, Aberfeldy, won with an exceedingly meritorious dozen.

Out of five competitors for stove or greenhouse trusses Mr. Common secured the winning ticket. Roses, Carnations, Dahlias, Asters, &c., were all in strong force in very creditable condition.

For a collection of eight varieties of fruit, Mr. Leslie was first, as he also was for two bunches black and two bunches white Grapes, each nicely finished. Mr. Stenning led for Melons. Beautifully coloured Peaches and Nectarines won for Mr. Common the premier award. Apples, Pears, and Plums were poor, but Gooseberries, Currants, and Raspberries were good. Mr. Harper, Tulliebelton, won for a collection of hardy fruit.

Vegetables were fair. Mr. Harper set up a splendid lot, for which a special award was given. Amongst the single dishes Leeks, Onions, Beetroots, Tomatoes, and Potatoes were specially meritorious.

Excellent weather was experienced during the three days, and it is hoped the Society will have benefited financially, so as to recoup last year's failure to some extent. Much credit is due to Mr. Alfred W. Brown, the energetic secretary, and his committee for the excellent arrangements they made and carried out, and we trust their efforts will be appreciated by the public.—ALBYN.

### Brighton and Sussex, August 25th and 26th.

This is the fiftieth year of the Brighton and Sussex Horticultural Society's existence, though it may not have held fifty annual shows. Mr. Richard Dean spoke ancient history, as is his wont, at the luncheon, and carried his listeners back to the early exhibition days of the society, when the Rev. W. Fellows, of Shottesham, and growers from far Norwich, came southward, at much less comfort than we can to-day, to compare the merits of each other's produce, Dahlias particularly, at Brighton by the Sea.

There were nearly eighty gentlemen present at the luncheon, on the invitation of Jeremiah Colman, Esq., who is the president and occupied the chair on this occasion. He spoke most interestingly, as, indeed, did all of the toast-proposers. The Mayor of Brighton gave "Success to the Society," and referred to the elevating attractions of botany and horticulture.

Mr. John Thorpe, the very assiduous secretary, gave figures showing how large was the increase of exhibits and exhibitors this year over last, and stated that the society was in a good way, and was doing much service of an educational and entertaining kind.

In all departments the exhibition merited the highest praise, and never have we seen a finer little provincial show. The fruit was everywhere excellent, while cut flowers, plants, groups, vegetables and decorations, all housed in the Dome and Corn Exchange, were choice, not a weak exhibit (except Roses) being presented to view. So long as Brighton can garner such beautiful produce, and act so liberally to competitors (there were £5 prizes and several silver cups and medals), her summer horticultural show will rank with the best in all England.

Medals were awarded to honorary exhibits; and certificates of merit to new Dahlias. Those exhibiting the latter were Messrs. Stredwick and Son, and Cheal and Sons, both Sussex nurserymen.

Mr. H. Head, The Drive Nursery, Hove, was foremost for the table of plants, with Lilies, Bougainvilleas, Isolomas, Celosias, &c. Second came Mr. Geo. Miles, of Dyke Road, with a thin group.

In class 33 (for a similar group), which was confined to gardeners, the lead went to Mr. H. Goldsmith, gardener to Daniel Hack, Esq., Fir Croft, Withdean, with Isolomas, Begonias, Coleus, Caladiums, Eulalia and Ferns—a sweet little group, and well deserving first place. Mr. Geo. Norman, gardener to P. H. Bayer, Esq., Hatch Beauchamp, Withdean, was second; and Mr. W. E. Anderson, gardener to B. Parish, Esq., Melodia, Preston Park, came third.

For a table of Carnations in class 16, Miss Shiffner, Coombe Place, Lewes, was a deserved first, with an ably arranged display, in which the leading varieties were represented. Mr. H. Elliott, of Courtbushes Nurseries, Hurstpierpoint, was a close second, having Pride of the Market, Raby Castle, Brightonian, and Janie Piper.

Only two lots of table plants were forward, the twelve best coming from Mr. Hugh McFayden, gardener to L. Breitmeyer, Esq., Cuckfield Park, Cuckfield; and second, Mr. E. Lawrance, gardener to T. Oliver, Esq., Tanbridge, Horsham. Each was excellent.

For dinner-table decorations the leading award went to Mrs. S. Lindsay, The Laurels, Hailsham, who used white Poppies, Bougainvillea flowers, and Cosmos bipinnata in glasses over a silver-wrought centre cloth. The second went to Mrs. Coleman, of Ferring, near Worthing, with a very different arrangement, comprising Montbretia and Ferns. Third, Mrs. A. Cooper, of Broadwater, Worthing, with a heavy assortment of Carnations and Lilies; and fourth, out of a competition of twelve entries, came Miss Edith Jerrard, Laine House, Preston Park, Brighton. The furnishing of all the tables left little room for dishes. They were very different to what one sees at the Temple Rose Show.

BOUQUETS furnished an interesting feature. Mr. A. W. Trossell, Lavender Hill Nursery, Tonbridge, Kent, led for the bride's, with Francoa, Lilies, Stephanotis, Gardenias, and White Roses; and second, Mr. F. Webber, The Nurseries, Tonbridge. There were five entrants. For a ballroom bouquet, the order was Mr. Trossell first; Miss A. F. Harwood, St. Peter's Street, Colchester; and Miss Oliver, Tollington Park, London, next in order. The third prize bouquet was solely of rosy Oleanders.

For a floral device, Mr. Trossell was again first with a harp, beautifully put together. Miss L. Peters, North Street, Brighton, and Miss Webber, Tonbridge, came next, both with wreaths.

DAHLIAS made a good show. For six varieties of pompons, Mr. J. Harper, gardener to E. A. Tucker, Esq., Vernon Lodge, Preston, beat Mr. F. Rapley, gardener to Miss Visick, St. John's, Withdean; and third, Mr. E. Anderson, of Melodia. Mr. Harper's set contained Mary Kirk (yellow), Sunshine (crimson), Iobel (crimson-scarlet), Madeline (purple tipped and creamy base), Douglas (deep crimson), and Lillian (a pretty rose).

Mr. Percy W. Tulloch, Sterndale, New Church Road, Hove, was easily leader for six Cactus Dahlias in class 40, with Phineas, Mrs. J. M. Stredwick, Mrs. Ed. Mawley, J. H. Jackson, H. J.

Jones, and Etna. Mr. Tulloch's blooms were perfect, and his staging of them was exemplary. Second out of seven lots came Mr. A. B. Wadds, gardener to Sir W. Pearson, Bart., M.P., Paddockhurst, Crawley, but greatly inferior to the first; and third, Mr. J. Brown, High Street, Worthing.

Messrs. J. Stredwick and Son, of Silverhill Park, St. Leonards-on-Sea, were before Messrs. Cheal and Sons for the twelve Cactus varieties, furnishing a magnificent display. The flowers were spotless, of good size, and splendid, graceful form. We name the dozen—H. J. Jones, Mrs. J. W. Wilkinson, Ivanhoe, Geo. Gordon, Oliver Twist, Comet, Florence Stredwick, Osprey, Columbia, A. Sudley, and Ellen Kraemar. The whole of the Dahlia exhibits were greatly admired.

Single Dahlias were alone shown by Messrs. Cheal, who, however, had a wonderfully fine dozen. For the twelve pompon the same firm had it all their own way with neat flowers. Again Messrs. Cheal led for the twenty-four Show varieties, each flower being as fine and even as could be desired. Mr. J. Brown, of High Street, Worthing, came second.

Messrs. Cheal and Sons, of Crawley, were foremost for twelve spikes of Gladioli, but these were only fair: fresh they were, of course, but rather short in the spike. Mr. G. Norman came second.

BEGONIAS might have been improved, but some good plants were on view. Mr. J. Backshall, gardener to J. Lawson, Esq., Highlands, Hassocks, was in the van for twelve; and Mr. G. Norman followed second; the third being Mr. Anderson, of Melodia.

HARDY FLOWERS could not have been bettered, and for the eighteen kinds (not "varieties," as scheduled), Mr. J. Davis, gardener to Major Thurlow, Buckham Hill House, Uckfield, beat Mr. W. Manton, The Grange, Hurstpierpoint. The foremost here had grand bunches of *Dracocephalum virginica*, *Galtonia candicans*, *Lilium auratum*, *Saponaria officinalis* fl.-pl., *Phygelia capensis*, &c.

For the twelve varieties Mr. F. Rapley, of St. John's, was a good leader, and Mr. H. Goldsmith, Fir Croft, followed next.

For six bunches of Sweet Peas, the lead was with Mr. H. Harris, gardener to E. M. Eversfield, Esq., Denne Park, Horsham, with Black Knight, Miss Willmott, Lady Grisel Hamilton, Salopian, and Lovely. Mr. F. Webber, The Nurseries, Tonbridge, came second with less fresh bunches. Third out of seven came Mr. A. H. Parsons, 10, Malling Street, Lewes.

For the twelve kinds of annuals, Mr. J. Davis, gardener to Major Thurlow, was easily first with Love-in-a-Mist, *Viscaria cardinalis*, good Zinnias, and *Salvia Horminum*. Second out of six came Mr. F. Rapley.

ROSES were nothing to boast of. For the dozen varieties, Mr. H. Harris, of Denne Park, led, having fair flowers of Maman Cochet, Chas. Lefebvre, Marie Van Houtte, Victor Hugo, and Chas. Darwin. Mr. Harris also led for twelve Teas, with clean blooms of Marie Van Houtte, Comtesse de Nadaillac, White Maman Cochet, and Mrs. E. Mawley. Mr. J. Davis was second.

In class 27 (open) for the twelve Asters, out of seven contestants, the best were from Mr. F. Rapley. For the same number in class 38, for gardeners only, Mr. J. Davis, of Uckfield, was foremost.

FRUIT was excellent all through. For a collection of eight dishes, the first award fell to Mr. J. Gore, Polegate, with fair Muscat and good Gros Maroc Grapes; splendid Williams' Bon Chrétien Pears, Best of All Melon, splendid Figs, and Al Dr. Hogg Peaches, Milton Nectarine, and Lady Sudeley Apple. Mr. Edwin Neal, gardener to Mrs. Nix, Tilgate, Crawley, had excellent Black Hamburgh Grapes, Hero of Lockinge Melon, Royal George Peach, Pineapple Nectarine, and Jefferson Plums, he coming second. Third, Mr. Charles Earl, gardener to O. E. D'Avigdor Goldsmid, Esq., Somerhill, Tonbridge.

Mr. Gore again showed his ability as a fruit grower by winning first for nine bunches of Grapes in three varieties, having Gros Maroc, Muscat of Alexandria, and the little seen white Gradeska. The second prize fell to our old friend Mr. Wm. Taylor, gardener to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, S.E., with well finished Chasselas Napoléon, Madresfield Court, and Gros Maroc. Third, Mr. J. Seymour, Worthing, whose Alicantes were really grand. There were five competitors.

For three bunches of Muscats, Mr. J. Seymour, with good, but very green samples, led; second came Mr. Chas. Jones, Ote Hall, Wivelsfield; and third, Mr. Edwin Neal.

Nine entries for three bunches of black Grapes were here. Mr. Chas. Earl, Somerhill, Tonbridge, was first; Mr. Neal, second; and Mr. A. Kemp, gardener to C. B. Scrase Dickens, Esq., Coolhurst, Horsham, third, all with Black Hamburghs. The competition must have exercised the keenest powers of the judges, as the five bunches were almost on a par.

Mr. Neal was first for two bunches of any other variety; Mr. Earl second, and Mr. W. Taylor third.

Mr. Jones of Ote Hall had the best dish of culinary Pear (Uvedale's St. Germain). Mr. A. H. Parsons, of Lewes, had the best dessert dish, this being "Williams'." The lead for one Melon went to Mr. W. Nanton, of Hurstpierpoint, and Mr. Rapley second; there being eleven in all. For two Melons, Mr. Neal, with The Peer, a new variety that is winning far and wide,

was first; and Mr. F. W. Thomas, second; there being five entrants.

The two dishes of Peaches brought out six competitors, and Mr. G. Fairs, of the Hurst Wickham Nurseries, Hassocks, had marvellously fine samples, these being Mr. Gladstone and Sea Eagle, each fruit large, luscious, and rosy. Second came Mr. Eastwood, of the Down Hotel, Hassocks; and third, Mr. J. J. Wallis, of East Grinstead.

For one dish of Peaches, Mr. H. Elliott was first; Mr. G. Duncan, Warnham Court, Horsham, second; and Mr. J. Holman, St. John's House, Burgess Hill, third out of seven.

For the two dishes of Nectarines, Mr. Gore was in the van, having well-finished Milton and Stanwick Elruge. Messrs. G. Fairs and E. Neal, second and third respectively, out of six. For one dish, Messrs. H. Elliott, Holman, and Goldsmith, in this order.

Figs, one dish: First, J. Adams; second, H. Goldsmith; third, H. Harris.

Cherries: First, Chas. Earl; second, M. Tourle, Horsted Place, Uckfield; third, H. Harris.

One dish of Plums: First, M. Tourle; second, Wm. Taylor; third, J. Hill, Springfield, Withdean.

For the four dishes of Plums, Mr. J. Dedman, The Wallands, Lewes, led with Victoria, Purple Gage, Washington, and Black Diamond. Mr. C. Earl won second with smaller fruits; and third, out of six entries, Mr. Wadds, of Paddockhurst.

Apples in nearly every case were of a high order of merit. For the four culinary varieties, Mr. Earl beat Mr. F. W. Thomas; and third, Mr. Geo. Walder, The Mansion House, Hurstpierpoint. There were thirteen sets, making an aggregate of fifty-two dishes; and 312 Apples. For the single dish, Mr. Wickham led; second, Mr. Holmes; and third, Mr. H. Garnett.

For four dessert dishes, eleven contested for first place, which eventually fell to Mr. F. W. Thomas, with Lady Sudeley, Beauty of Bath, Worcester Pearmain, and Kerry Pippin. Second, Mr. A. H. Parsons; and third, Mr. Stovell, Withdean Grange, near Brighton. Mr. Garnett had the best single dish, this being Lady Sudeley.

VEGETABLES were staged by themselves in an upper hall, and represented good standard produce. The leading class was No. 62, for nine kinds, the first winning the society's silver medal and 20s. Mr. W. Manton, gardener to the Rev. R. Masheter, was the proud winner, with an excellent collection, comprising Autumn Giant Cauliflowers, Ailsa Craig Onions, Perfection Tomatoes, Solid White Celery, Autocrat Potato, and Snowdrop Potato. Second came Mr. M. Tourle, with splendid Snowball Potatoes, Model Telegraph Pea, Duke of York Tomato, and Scarlet Perfection Carrot, all from Carter's seeds. Mr. A. B. Wadds formed a good third; and Mr. R. Knights, of Framfield, fourth. There were six collections.

For the six kinds, Mr. A. Simmons, The Grange, Framfield, was leader, having grand Alderman Peas and Sensation Potato; second, Mr. Geo. Durrant, Albourne Place, Hassocks.

Potatoes filled the whole length of one table (and part of another), representing sixteen entries, each of six varieties, and six tubers on each plate—576 Potatoes. The premier set was staged by Mr. Wm. Brown, Police Station, Rottingdean, whose produce was even, not coarse, and very clean. The varieties were Up-to-Date, Sensation, Mainstay, Satisfaction, British Queen, and Baxtor. Second came Mr. A. H. Parsons, with Sutton's Ideal, Sutton's Ninetyfold, Daniel's Sensation, Windsor Castle, Up-to-Date, and Snowdrop. Mr. T. Wells, 24, St. Martin's Street, Brighton, was third, and Mr. J. Rogers, fourth.

For Tilley Bros.' prizes, Mr. R. Knights won first (c. 81), and for Davis and Sons' awards, Mr. A. Simmons led (c. 80). In c. 79, for Balchin and Sons' prizes, Mr. W. Manton was the leading winner. The best dish of Tomatoes was from J. Adams, of Hamsey, Lewes, and second, Mr. A. Simmons, there being thirteen entries.

NON-COMPETITIVE EXHIBITS.—Messrs. J. Peed and Son, West Norwood, London, showed single tuberous Begonias, also doubles, and a host of hardy cut flowers. (Silver medal.)

A varied collection of all sorts of garden produce was staged by Cheal and Sons, Crawley. They had Apple trees in pots, shrubs, hardy flowers, Ferns, and indoor plants, as well as Dahlias. (Silver-gilt medal.)

Messrs. T. S. Ware, Ltd., from Feltham, Middlesex, sent an enormous bank of seasonable flowers (silver medal); Balchin and Sons, of Brighton, had a very choice group, finely arranged, of Caladiums, and many other stove plants; also Cattleyas; Phœnocomas, Lilliums and Palms (gold medal).

Messrs. Mills and Son, The Potteries, Burgess Hill, contributed a very interesting display of vases and potteryware of all sorts, for the garden. These were exceedingly well finished.

Messrs. Balchin and Sons were also represented by a choice selection of cut shrub sprays. All sorts of coloured varieties were here, also the Sea Buckthorn (in berry), *Magnolia grandiflora*, *Berberis fascicularis*, *Cornus Späthi aurea*, and the Spanish Broom.

Mr. G. W. Piper, of Uckfield, Sussex, was forward with a charming display of Tea Roses, in which Mrs. E. Mawley was exquisite. His new Peace was also in A1 condition. (Silver medal.)

## "Handy Clip" Tubeholders.

Mr. W. J. Godfrey, nurseryman, of Exmouth, Devon, has invented and patented an arrangement for flowers which we figure on this page,

No. 1.—The wire clip.

No. 2.—The clip simply fixed to a bamboo cane, with a zinc tube inserted.

No. 3.—Illustrates the No. 2 with ten clips and tubes, ready to be dressed.

No. 4 is dressed with Winter Queen Chrysanthemum, as exhibited at the Royal Horticultural Exhibition, London, in February last.

Fig. 1.

and also print the remarks the patentee has sent to us: "There has been found hitherto a difficulty to fix flowers (in vessels of water) in awkward places, such as altar screens, pulpits, pillars, mirrors, curtains, &c. The 'Handy Clip' supplies the thing so long desired, and will prove a boon in decorating churches, halls, and rooms in general. It is a simple arrangement by which a tube to hold flowers can be affixed in positions where it is not possible to drive a nail, or otherwise fasten a support for flowers in water. Altar screens, pulpits, pillars, mirrors, can easily be decorated without the aid of nails. A piece of string, cord, or small rope is tied around and suspended from any projection on which the 'Handy Clips' can be fixed. By their aid curtains, draperies, &c., may be quickly festooned with flowers. A bamboo or any other stick or rod may be stuck among the foliage or other plants, or in a flower pot of soil, and can be readily dressed with flowers. They only require to be used once for their merits to be fully appreciated, and their adaptability to many uses to be readily understood. The principle is a holder made of wire. The ring to hold the water tube is pressed, which causes the smaller ring to open. This open ring forms a grip, and when the tapering vase to hold the flowers is inserted and pressed down, the grip is made firm. They are very quickly fixed and removed. The No. 1 size, clip and tube complete, cost 3s. 6d. dozen, post free; and No. 2 size cost 6s. per dozen."

Fig. 2.

### Heywood and Horticulture.

The following letter from Dean Hole was read at a meeting held at the Technical School, Heywood, Lancs., to consider the proposal to form a horticultural society for Heywood and district:

"The Deanery, Rochester, August 13th.

"Dear Sir,—Having found in gardens and with gardeners a chief happiness of my life and many of my dearest friends, knowing the good influence which horticulture has upon all sorts and conditions of men, I rejoice to hear of the new society which you propose to form for Heywood and district, and heartily wish you success. It might be beneficial to ask the Mayor to call a meeting and to appoint officers and a committee. The secretary should be an enthusiastic gardener and a good man of business. Obtain the sympathy (and the subscriptions) of the most influential neighbours, ladies and gentlemen, your M.P., and clergy, but at the same time do all you can to interest the cottage gardeners. If you can induce a working man to take some pains with his vegetables and teach his wife how to cook them, you will do more to keep him sober than all the blue ribbons and pledges worn or signed. — Sincerely yours, S. REYNOLDS HOLE."

## Canning Interests in New Jersey, U.S.A.

Canning in New Jersey had its birth about the close of the Civil War. At that time Tomatoes were the principal article. To-day the industry has broadened until almost every kind of fruit and vegetable is put up. The market is no longer confined to that country, but large quantities are exported to England, which is the chief country for consumption of American goods in tins. For many years the packers tried to use glass, but this kind of package for Tomatoes has almost entirely disappeared, the tin being cheaper and in every way preferable.

It has been estimated that there are close to 500,000,000 cans of fruit, vegetables, meats, &c., put up in the United States annually, and, accepting this as approximately correct, it is remarkable how few cases of sickness arise from the use of these goods. It would seem that nature intended New Jersey for a Tomato growing state; the soil is peculiarly adapted for this purpose, and in the high quality of the goods packed she is not excelled. It is estimated that there were 22,000 acres grown in the State last year, sufficient to pack say 900,000 cases, and including the early crop this past year, it is safe to say that 750,000 dollars was received by the farmers of New Jersey for their Tomato crop.

The berry crop of New Jersey has grown to large proportions. For the production of certain varieties of Pears it is not excelled. Sweet Potatoes (*Ipomoea*) have also become an important article for the canner. It is safe to say that at least 1,250,000 dollars

Fig. 4.

is annually paid by the canners to the farmers. In the early days of the industry the notion prevailed that any kind of an old place was good enough for a cannery; an old shed, a barn, or a threshing floor would answer. The embryo packer appropriated his wife's cook stove and wash boiler, or used a large iron kettle, such as farmers use for trying out lard.

There have been seen goods and cases piled out in the weather, subject to the storms and changes of temperature; the owner having no thought of injury, the appearance of his goods being a secondary consideration. In the evolution of the business these things have passed away, and now are to be seen fine large factories, substantial and well kept.

### Fruit Forcing.

**VINES: EARLY FORCING IN POTS.**—The canes for starting early in November to supply Grapes fit for table towards the close of March or early in April must not be allowed to become dust dry at the roots, for that impairs the vitality of the Vines, and may cause the incipient bunches to perish in the buds. Too much water, on the other hand, is inimical to the tender roots, often causing them to decay. Suffice, therefore, that the soil be moderately moist. The Vines should now be at rest, the wood quite brown and firm, the buds round and plump, the laterals cut close to the cane, and this shortened to about 6ft. more or less, according to the situation of the sound buds and the width of trellis. Dress the cuts—the wounds only—with the best French polish or patent knotting whilst they are quite dry as a preventive of bleeding. The Vines should be kept in a cool, airy house.

If the canes have to be bought orders should be given now, so as to secure sturdy canes with plump buds of the desired varieties. The most suitable buds for early forcing are White Frontignan, Foster's Seedling, and Black Hamburgh.

**UNSATISFACTORY VINES.**—These may be improved by removing the soil down to the roots, picking it out carefully from amongst them, and supplying fresh loam, raising the roots where practicable, and laying them in new soil, especially the fibry ones and those proceeding from the collar. With the roots lifted, laid in fresh compost, and covered 3in. or 4in deep, the Vines generally form abundance of fibrous roots in the new material, and become almost independent of the large roots, which are comparatively inactive through the lower part of the border having become effete. This is best done in advance of the leaves falling, and a gentle watering being given the roots will take to the new soil at once. Vines at rest must not be allowed to become very dry at the roots, for the borders then crack and part from the walls, causing the young roots to perish, and the soil is difficult to make thoroughly moist after it gets into a parched condition.

**YOUNG VINES.**—Those having made a strong growth, and to be cut down to three plump buds from the bottom of the trellis to furnish a leader and side shoots, one on each side of the rod, another season, may be allowed to grow as long as they like, taking the precaution to keep the principal leaves that correspond to the pruning buds free of spray, so that that part of the cane may get thoroughly ripened. Vines, however, that are expected to do something more than "prove the variety" next year, should have further growth discouraged by the removal of the laterals as they appear, taking care to leave some growth as an outlet for the excess of sap, otherwise the pruning buds may be started.

By this time the wood will be getting brown and hard, and the laterals may be gradually removed, cutting them back in the first instance to one joint, and in the course of ten days to a fortnight they may be cut away close to the cane provided they have not pushed fresh growth, but if they start the buds on the laterals the growths must be pinched at the first leaf, and the removal of the laterals deferred to a later period. In this case the Vines should be assisted with fire heat, maintaining a minimum of 65deg and a maximum of 75deg until the wood is ripe, accompanied with free top and front ventilation.—ST. ALBANS.

### Kitchen Garden.

**LETTUCE.**—Plenty of sweet, crisp, and tender Lettuces should be available for the present use with others of fair size, growing freely for succession during the early part of autumn. From recent sowings there will also be seedlings ready for transplanting, and these well established now will make useful plants for early winter use, while the smallest may pass through the winter and make fine plants to advance to a larger size as spring comes on. Still, the largest seedling plants do not always answer the best, and it is well not to rely on any one sowing, but to make several—one at the present time, and other early next month. The hardiest varieties to be found among the Cos and Cabbage Lettuces are the best for present sowing, choosing Black-seeded Bath Cos, Hardy Hammersmith, and All the Year Round, as amongst the most reliable. Rich ground is not to be preferred for winter Lettuce, but soil of moderate fertility, well drained, open but sheltered position. Sow in drills 9in. or 10in. apart.

**ENDIVE.**—Young seedlings now attaining a fair size must be thinned so that they do not spoil each other by crowding. Many of the thinnings will be suitable for transplanting, choosing ground

which in winter will provide some protection from cutting winds and severe frosts. Further sowings, too, may be made. Winter Curled being a good variety. Full grown Endive is not ready for use until blanched, which must be effected by inverting a pot over the plants when dry.

**CABBAGE.**—Seedling Cabbage plants are attaining a size large enough to handle, and prick out a few inches apart to strengthen. The seedlings remaining in the beds will soon fill up the spaces, and attain a size suitable for final planting at an early date.

**TURNIPS.**—Thin out seedling Turnips as soon as practicable, going over the rows several times. Make another sowing. Dust seedlings lightly with soot to accelerate growth.

**LEeks.**—Leeks are gross feeders, but in good ground with ample moisture they can find a fair supply of food, which, however, may be supplemented by applications of liquid manure, where finer roots are desired. Soil drawn to the roots and round the stems largely assists in the process of blanching.

**ONIONS.**—Onions sown or planted in spring have completed their growth, and may be lifted, or rather pulled up. It will depend on the weather as to the manner of drying. In damp weather place them under a shed with plenty of air circulating. If they can be fully exposed to the sun outdoors this treatment is best, and completes the ripening of the bulbs. Store in a cool, dry place. Sow another row or two of Tripoli Onions.

**POTATOES.**—As the haulm of Potatoes shrinks, yellows, or dies down the tubers may be lifted, the sooner the better, should wet weather prevail, though the work is not so easily carried out under such conditions. It will be difficult, if not impossible, to dry them sufficiently for storing except under cover, a dry, airy shed being the best place. When picking up the tubers in the first instance discard all the small ones, also those affected with disease. The tubers selected for seed must be perfectly clean, good shape, and of medium size. For eating, the tubers must be thoroughly dried, then storing in a very cool, perfectly dry place. The seed tubers may be placed thinly in boxes, and kept on an airy, light shelf free from frost.

**CELERY.**—Following upon early rows now in use, more Celery may be finally earthed to maintain a succession. The later rows may be assisted with liquid manure, first removing superfluous leaves from the base, and suckers springing around. Tie the leafstalks loosely but firmly together, and earth some soil round, breaking it down if lumpy into a fine condition. Work a good proportion of soil round the plants with the hand. In the first two or three earthings leave a broad base of soil on each side the rows to receive the next earthings.—EAST KENT.

### Meteorological Observations at Chiswick.

Dull weather, with cold gusty winds has been the prevailing feature of the week ending the 15th, with an occasional burst of bright sunshine, and rain on five days. Strong winds and showery weather have been the prevailing features during the past week.

# THE BEE-KEEPER.

## Position of an Apiary.

Many difficulties arise with the young bee-keeper, but few consider how important it is that a good site should be chosen. There are a few good rules to be borne in mind which ought to be considered when a position for the hives is to be selected. We all know how much easier it is to get a load down than up hill; remembering this, then choose a rather low than a high position, for the bees return home very heavily laden during the height of the honey flow, and by considering them in every possible way we shall increase our harvest. Experience teaches us that the winds from the north and east are piercingly cold; then protect the hives from these winds, if possible, either by placing them in a valley protected on the north and east side by hills or rising ground, or by a good thick hedge. Again, the south-west winds bring rain usually, so do not allow the entrances to be exposed to this wind; in fact, apart from the rain it is best to let the entrances face due south, or, better still, south-east, to catch the early morning sun, in order that the bees may be up and doing, for we soon learn that the honey season, even in the south of England, is all too short.

**THE SOURCE OF NECTAR.**—The above must be searched for and got as near it as possible. The beginner thinks that all flowers are visited by the honey bee, but when he has started he becomes very observant, and discovers that all flowers, even his favourites, are not visited. From what, then, do the bees gather the main part of their sweets? This varies in different parts, but generally speaking from white clover, the lime trees, mustard, and heather. In the neighbourhood of market gardens many other flowers yield a rich harvest, but none more so than the mignonette. The bees fly about two to four miles in a direct line from their homes in search of honey, but if we can get nearer the supply much valuable time is saved.

In conclusion, remember to keep the ground in front of the hives free of weeds, &c.; place the hives with their backs to the paths, but facing south or south-east; and keep the hives 6ft apart in the lines and 12ft between the lines.—HYBLA.

\* \* All correspondence relating to editorial matters should be directed to "THE EDITOR," 12, MITRE COURT CHAMBERS, FLEET STREET, LONDON, E.C. It is requested that no one will write privately to any of our correspondents, seeking information on matters discussed in this Journal, as doing so subjects them to unjustifiable trouble and expense.

**PEACH SHOOTS DISEASED (R. F.).**—See our answer to your query under "Fruit Notes" in the body of the paper.

**MELON PLANTS GOING OFF AT THE ROOT (J. T. C.).**—Your query is answered under the heading "Fruit Notes" on another page.

**BROWN SPOTS ON APRICOTS (J. W. B.).**—Yes, the fruits are affected by a fungus, *Sclerotinia fructigena*, this being the final or resting stage, but is more commonly referred to as the brown rot fungus, *Monilia fructigena*, this being the early stage of fruiting, or the conidial condition. It attacks many fruits, the Apple, Cherry, Peach, and Plum, and very often Pear, and also attacks Apricots, being common on various wild fruits belonging to the order Rosaceæ. To the casual observer it is only noticed on the fruit, but the fungus occurs in the young shoots, leaves, and even the flowers. All diseased fruit, therefore, should be collected and burned. Where the trees have been diseased they should be sprayed early in spring with a solution of sulphate of iron, made by placing 2½lb of iron sulphate in a wooden vessel, and pouring on it 2oz of sulphuric acid, and then adding by degrees 5gals of water. This, strained, should be sprayed on whilst the trees are quite dormant, always before the leaf-buds begin to swell. After the buds have expanded spraying with dilute Bordeaux mixture is advised, but this on downy fruits, such as the Apricot and Peach, is often quite as disastrous as the brown rot; therefore we advise "blue water" or ammoniacal carbonate of copper solution, and in using this ascertain a safe strength before applying, repeating at intervals of ten days or a fortnight.

**THE STUDY OF AGRICULTURE ("Desideratum").**—"A young friend of mine, twenty years of age, tall, and healthy, who has been brought up in the office of his family's business, has taken a distaste to office work, and does not take that interest in the business that would insure success. Many of his relatives are Canadian farmers, and there is a probability that he may be sent out there. Of course, he has just now no knowledge of agriculture whatever. Would you in your next issue suggest a course of study that would give an elementary theoretical knowledge that would be useful to one with such prospects?"

[We think your young friend's best course would be to go through one of the County Council's Agricultural Training Colleges. There is an excellent college at Aspatria, in Cumberland, which is within easy reach. He had better write to the Principal, Agricultural College, Aspatria.]

**RUBBER INDUSTRY (W. G. S.).**—We think that Peru is likely to be too dry for a successful culture of rubber-yielding plants, also too limited, but we may be wrong. *Hovea brasiliensis*, various *Landolphia*s, and *Kicksia elastica* are the genera mostly cultivated. *Castilonia* is a quick yielding subject, giving returns in six to eight years, we believe, in Malay and the adjoining islands. Para rubber (from Para, in Brazil) is much renowned, and up the valley of the Amazon there are great rubber cultures. For ourselves, we would probably incline to British East Africa and the Shire Highlands as a likely place. We have a gardener acquaintance out there now, who first went out as manager of a tea plantation. He saw money in rubber, and forthwith started on his own. He made £300 the first year, but this was from collected rubber, brought and sold to him by natives, so that he only was an agent, and not a cultivator. We have not heard from him for two years, but his last letter stated that the supply from natural sources would soon be drained. Write to the Consul for Peru, at his Southampton address; he may assist you. An outfit would cost at least £15 to £20; the passage money and cost of living would depend entirely on where you went to. Perhaps the Emigration Office at Whitehall, London, could send you useful particulars.

**PARSLEY AND MIGNONETTE UNHEALTHY (E. J. P.).**—"I enclose specimens for advice. The plants come up looking healthy, but in the case of the Parsley, the whole row turned yellow and seemed to be quite dead. I watered it with lime water, and now have a fresh growth, but have had the same trouble with another lot in another bed. The other plants enclosed have gone in exactly the same way, but the Mignonette did not all go at the same time, some seeming quite healthy until it was in bloom, and some going soon after it was above the ground. This is from a Vine border. It only seems to affect certain plants, but catches these wherever we plant them in the garden. Can you advise me what to do?"

[The Parsley is affected by the Carrot rust (*Phoma sanguinolenta*), a parasitic fungus, forming sunken canker-like spots on the root of the plants, and, girdling the tap root, causes the plant to have a withered and yellow appearance on the leaves, these going back considerably, and sometimes the plants go off altogether. There are also traces of rust caused by the Carrot fly (*Psila rosæ*), and this is probably the main infection, or rather has been, as this form of "rust" is an early infection, and seldom occurs on Parsley or Carrots sown in the middle of July. The Mignonette is also affected by a disease very similar to that caused by the Carrot fly, a minute maggot eating away the soft part of the root, but it is of an orange colour, and we have not been able to rear the fly. The best treatment you could give the land would be a dressing of gas lime, or of lime, as given in our article on "Cabbages Infested with Grubs," August 6, page 121. Now you may use ammoniacal liquor from gasworks diluted with five times its bulk of water, pouring it alongside of the row or between the rows of Parsley, not over the tops of the plants, giving as much as on an ordinary watering, this acting well on the parasites, and also as manure. The lime water is also good, acting specially well on the "rust," whether caused by fungus or maggot. If not readily procurable you may use Little's soluble phenyle, 1 fluid ounce to 3gals of water, and pour it between or alongside of the rows similar to the diluted gas liquor. This, Little's soluble phenyle solution has special value against root fungi, and also Carrot fly maggot, and may be repeated at intervals of about three weeks, though it will scarcely be required more than once or at most twice this season. It is a capital plan to trench the ground, and also dress the land with a mixture of 8 parts basic cinder phosphate and 3 parts kainit, applying 7lb of the mixture per rod (30½ square yards), pointing in lightly. The mixture is best applied in autumn or during winter up to the middle of February.]

**NAMES OF PLANTS.**—Correspondents whose queries are unanswered in the present issue are respectfully requested to consult the following number. (J. M.).—Yes, it is *Saintpaulia ionantha*, and its Natural Order is Gesneraceæ; 2, *Cyperus longus*; 3, *Veronica longifolia subsessilis*; 4 is probably a *Convolvulus*, but too scrappy to name from. (F. M.).—*Hypericum Moserianum*. (J. T.).—1, *Dendrobium formosum*; 2, *Oncidium varicosum*; 3, *Cypripedium Morganii*.

## Disappointments.

The harvest moon has again risen, waxed and waned, but it has looked down on little harvest work, and such as there is in course of doing is not of a satisfactory nature. We had no real winter, we had no spring, and even less summer. Taking the country all round, the rainfall has been abnormally heavy and the temperature low.

A wet June gave hopes of a dry July, but alas for the futility of such hopes! July wetter than has been known for forty-five years. The dull, cloudy days make the evening shadows appear to fall early, and the blustering winds sound like the forerunners of autumn. It often happens that the South country harvest is cut and gathered in broken weather, and then our friends of the North reasonably expect, and generally get, better weather for their more backward crops.

We doubt if this is going to be the case this year, unless, indeed, the fine weather is holding back for the Scottish harvest. Not only is corn slow in ripening, but much of it is badly laid and storm-broken, thus making the difficulties of harvesting four-fold. No reaper or binder yet invented can deal with a crop of heavy corn laid, torn, and twisted, as some fields at present are. Here comes in the difficulty to that man who, depending on machinery, has failed to secure adequate hands.

It may be thought by some that the present high winds which prevail will be of advantage to the farmer. True, they help to dry the land, and also—and this is a serious business—do much damage by “necking” such Barleys as are approaching ripeness. A field of “necked” Barley once seen is never forgotten. The forest of straws standing headless, or with the ear hanging, as it were, by a thread, ready on the first touch to fall to the ground: Why Barley should “neck” is not quite apparent. Possibly there is in some of the new and best varieties of Barley a lack of tenacity in the straw, for we usually think of grain as bending to the breeze, not breaking. To gather up these fallen heads is an impossible task, and the loss per acre is considerable. We fancy Oats so far are hardly ripe enough to enable the wind to thresh out the upper grains, and so, for the present, they are safe. Where Barley, through being laid, has partially escaped the necking process the damage also will be great, for laid crops never fill or ripen evenly, and even ripening is the most important factor in making a good sample for the maltster. We all know what indifferent stuff “night-ripe” fruit is, and laid corn may be ranked pretty much in the same category.

We have been reading the “crop returns” for the United Kingdom, and the variations in the estimates in this small area are very great. All writers allow that hay and Beans are well above the average, two crops which require (and have got this year) almost excessive moisture. What has struck us about the Bean crop is its exceeding cleanliness—no black fly or lice, and the haulms corned up to the very top. A good Bean crop is a valuable asset, especially if Maize continues to rise in value.

Oats, too, have profited by the moisture, and the root crops generally, with the exception of Mangolds. Lack of warmth has been a drawback to the Mangold; also the late, untoward spring was the cause of much Mangold land being but badly prepared for seed. There was a difficulty in getting a full tilth, and a fine soil is what the sprouting Mangold loves. Wheat, Barley, and Potatoes come out badly in the reports. There is a constant complaint of lack

of sunshine, without which Wheat cannot show a good, plump berry. There is still time for Potatoes to improve: that is, if disease does not appear, and the South country reports speak of the prevalence of it. So far, we believe the northern counties have escaped, but what may be the result of a continuance of this damp, heavy weather we should not like to say.

It is always supposed that the Eastern counties are peculiarly dry. This year has proved the exception. A rainfall in July of 5 to 7 inches from North Shields to Brentwood in Essex does not seem like the record of a very dry country. Surely the times are topsy turvy. There is one thing in favour of this “droppy” time, and that is “Keep.” Of course, under this head will be included the growing Turnips, the grass proper, and the eddish. There is always a risk for lambs when the pasture is full of growth and the herbage more or less unripe, but a careful flock master will, by the use of dry, hard foods, counteract the effects of too much succulence. It is a great blessing to have plenty, and with the well-won hay crop winter will have less terrors than usual.

Now for disappointment again. Government, look out! We have several indictments against our legislators. How can we compare the cars of Juggernaut with our fiendish motors? They are mild in comparison, for if we remember aright the Juggernaut cars are only driven out at festival times; but these motors are upon us for ever. They talk about no danger with a twenty mile speed on country roads. Are there no teams passing to and fro from the homestead to the field? No heads of slow-moving cattle? No flocks of sheep? No lumbering, heavy carriers' carts? No ladies out in their pony carriages? As to the latter, they will be driven from the roads altogether. It was bad enough to pass a locomotive when the flag man led a restive pony past, but how will it be now? And, in case of accident, who will be able to prove negligent a chauffeur? We know of many a mile of country road bordered on each side by deep, fearsome drains. How about the occupant of a light pony cart under circumstances of that kind? Life has new terrors that our fathers never imagined.

We see only to-day two cases in different counties where drivers in charge of motor-cars were found to be incapably drunk—fine £2 in each case! Is that adequate? A motor under control is bad enough; a motor under the charge of a madman or an incapable is simply an engine of most terribly destructive powers. Is it possible that the fine is limited to £2? We hardly know at what figure it should be put if public safety be in the least consulted.

Again, supposing the motor-car is perfectly harmless, what of the destruction of the horse-breeding industry? What of the smaller demand for good old Oats and sound, well-got hay? We are told we must utilise motor power on our farms. Well, it will have to get a great deal cheaper first, and a race of men must be bred and trained specially for the management thereof. We fancy at the next election (which cannot be far off) intending candidates will hear more than they possibly like on the question. Let us hope they won't unduly irritate the minds of their constituents (especially in the rural districts) by coming round on the canvass with a motor running at full legal speed. At the last election very disparaging remarks were heard here about the man who went round in a puffing, hissing machine, and it is a fact that the man who drove the pair of clinking good horses is our representative at present!

We have not got the Butter Bill through—one of the many innocents slaughtered. Everything seemed pressed to the wall to make room for twenty miles an hour! We had also thought that our interests were of such importance as to merit the sole attention of the special Minister told off to represent us. Our industry is beset with trials and difficulties all along the line, and yet Lord Onslow is taking in hand as well as our affairs those of the Fishery Board. We fail to see anything analogous in the two departments, except that one relating to the harvest of the land—the other to that of the sea. A friend who is farmer and smack-owner draws a larger revenue from the latter than the former. Lord Onslow will be a man of great versatility and power if he can manage both departments with success.

## Work on the Home Farm.

At last the reapers are at work but four days later than the date we fixed at midsummer. The crops even now are none too ripe, neither the weather too propitious, but there may be many

dangers following if we delay. So far the crops are fulfilling their promise, the stooks stand thickly together, and as binders make all sheaves alike, that is good evidence of heavy crops. Both Wheat and Barley are heavy in the sheaf, and quite satisfactory as to quality. We were fortunate to miss the heaviest of the June rains, and are now reaping the benefit from that immunity.

On congratulating a neighbour on his possessing an exceptionally fine piece of Wheat, he informed us with a shake of the head that the crop was full of bunt, notwithstanding the fact that the seed was properly dressed. The dressing used was one with a fancy name, "anti-something or other," but it was evidently quite ineffectual. How long will it take to convince farmers that the safest and most effectual dressing is powdered blue vitriol, and that fancy mixtures are often only adulterated and expensive forms of the same article with the strength reduced below the point of efficiency.

We are still able to keep a couple of skerries working amongst the Turnips, which would have been impossible before the advent of string binders. The real stress of harvest work does not commence now until the time of stacking. As we have little laid corn there are no men occupied in mowing this year, except in the always necessary opening out.

The Clover fog has been a little too strong for the lambs, which have scoured a little, and we have removed them to old pasture, where they are receiving Cabbage ad. lib. We shall fold them on the remains of the Cabbage at once. The Kale is nearly ready for stocking, so it will be ready to follow the Cabbage up with. The red Clover will now be stocked with ewes until we have some Barley stubbles cleared for them. Those who want early lambs must put the ram with the ewes at once, so that the lambing may commence by the end of January. Put the ewes in a good pasture, and give them an allowance of old Barley, say  $\frac{1}{2}$  lb per head per day.

Strong pigs are still making fair prices, but suckers are very cheap; we saw some very good ones at 14s. per head. Hens are beginning to moult, and eggs are diminishing in numbers; price, thirteen for one shilling.

## R.A.S. and Park Royal.

To the President and Council of the Royal Agricultural Society of England.

Gentlemen,—As a member, and one interested in the welfare of agriculture, I deeply deplore the failure of the recent show. My personal experience is probably that of many. I went to London to attend the show on the opening day (Tuesday), leaving Birmingham by an early train, arriving on the show ground soon after ten o'clock. The stand allotted to my firm (who have been exhibitors for many years) was practically unapproachable for mud, and a sleeper road in the centre of the avenue conveyed those few people who came along, and who were able to get by if there were no carts or waggons in the way. I understand even when the ground had dried passers-by kept to the sleeper road 10yds from the stands, and the rules forbid representatives to solicit away from their stands. It took me until one o'clock before I could get any official on the spot, and when at last an attempt was made to effect some improvement, an object lesson was afforded of the way in which the money of the members of the society is woefully squandered. After two o'clock a dozen or so navvies were brought on the scene, many of them much the worse for drink, and were left standing about for some time, some with shovels, some without, but apparently not knowing what they were to do. Shortly after a cart appeared, followed by a second one, and the spectacle was observed of some twenty navvies crowded round one cart, evidently enjoying the fun of pretending to work. This sort of thing went on till nearly four o'clock, when I left the show ground in disgust, the whole of my time and expense in going to the show having been thrown away.

Many contributed to the fund to assist the council of the society in purchasing and equipping a permanent site, whilst doubting the wisdom of going so near London; but it was expected that, however unsuitable the geographical position, the council would choose a site in every sense favourable. It is self-evident that part of the site is flat, low, and in case of bad weather likely to be a veritable bog, with the disadvantage of being comparatively inaccessible. Whoever were responsible for the selection of such a position have loaded the Royal Agricultural Society with a "white elephant" so far as its becoming a successful agricultural show site. The news of the unfavourable position and prospects of the show travelled far and wide long before the date fixed for the show; and when, within a reasonable period of the date for holding the show the general public learnt that the ground was in a most unsuitable condition, the death blow was sounded so far as the success of the show was concerned. In order to convince you that outsiders could see the risk bad weather would involve, my brother, who visited the ground before any shedding was put up, ordered a

floor, which has cost £7, to be laid at our stand to meet contingencies. Never, in the whole course of our attendance at shows before, has a floor been laid at our stand. This speaks for itself.

The grievance as to the site was small as compared with the negligence displayed to the many exhibitors of implements, medicines, condiments, &c. A very strong word might be applied to the action of the society in receiving thousands of pounds, and then allotting space in such impassable or out-of-the-way places as to be practically valueless. It goes without saying that unless exhibitors like ourselves receive fair treatment many will decline to exhibit, or take less space. It would appear to a large majority who are not in touch with the action of your council that the show ground has been arranged without any regard to the feelings or desires of would-be exhibitors, and with all due respect to their judgment, I am strongly of opinion that they should have consulted a number of representative firms who have been in the habit of showing for some years as to their views on the best methods of placing the shedding. Not only so, but even the want of arrangement in the avenues was most striking.

The exhibitors who occupied the various sheddings paid thousands of pounds in fees and outlay in fitting up their respective stands and equipping their staff. No consideration whatever appears to have entered into the council's mind as to the absolute throwing away of all this expenditure, although it must have been well within their knowledge when they received the entrance fees, or at any rate at a period long prior to the opening of the show, that this expenditure would be absolutely thrown away, and the various exhibitors should have been advised, with the option of having their monies returned. Granted the state of the ground and weather being everything to be desired, the positions allotted to many in the implement yard were far inferior to others. Consequently, why should the pro rata charges for space be the same? I am now referring to the special shedding. Much ground that could have been utilised for the show was wasted, and much ground that was utilised was absolutely worthless. For instance, a vast stretch of ground, high and comparatively dry, facing the west entrance, remained unutilised; also another large tract on the left of this, and further open space facing the east entrance. The disgraceful condition of the approaches to the stand occupied by my firm was bad enough, but some in the smaller avenues were absolutely desert places to the visitors to the show, as no one would venture along them. Why was it that some large refreshment booths and wine and spirit stands were placed in the very best positions, when they could have equally as well accommodated the public in some remoter portion of the ground?

The treatment accorded to some of the old exhibitors in comparison with that accorded to exhibitors who have but recently come into existence (and I am not sure if some were not at the show for the first time) was striking, and no consideration appears to have been given to such exhibitors who were prepared to take up a larger amount of space than hitherto, and to spend a considerable sum of money in making their stands tasteful and pleasing to the eye. What inducement is there for exhibitors to make expensive and effective fronts if they are to be banished into obscure positions? Certain firms, whose names could be mentioned, have year after year been accommodated with prominent front positions, and it would be interesting to know why the same rate is charged for front positions as for back and side. To sum up the whole matter, the want of success of the show is due partly to its unsuitability; and, so far as exhibitors who attend for the purposes of business are concerned, mainly due to the want of practical knowledge of those who have had to deal with the planning out of the show ground.

The very unsatisfactory impression already made on the exhibitors, visitors, and representatives, will not add to the better chance of success another year. All those representatives attending stands badly placed, &c., will, in the ordinary course of conversation with their clients, in all parts of the country, still further prejudice the society and Park Royal. This point may not have occurred to your society, but you must not forget that many exhibitors have most of their staff representatives at each Royal Show, and they are drawn from all the districts in England, so that after a show like the Royal they do not hide their light under a bushel, and their opinion is fully expressed.

It is evident if the Royal Show is to maintain its position, and not to retrograde, it is desirable that the council should consist of men of sufficient ability to contend with the evils that I have pointed out. I am willing to make every allowance for the difficult position the society was placed in, but as the disaster was predicted months ago, there was ample opportunity for the society to have known whether or not any arrangements could be carried out to make the show ground suitable.—I am, gentlemen, your obedient servant, LAWRENCE C. TIPPER, Veterinary Chemical Works, Balsall Heath, Birmingham, July 30, 1903.

*Journal of Horticulture.*

THURSDAY, SEPTEMBER 3, 1903.

*Quid pro Quo.*

THINGS are not always what they seem, and it is tacitly admitted that in the gardening world they are not quite as they should be. Evidence of it is not wanting, inasmuch as that occasional letters crop up in our gardening papers anent wages, lodgings, hours, and holidays, all of which may be summed up as the gardener's *quid pro quo*, for that is really what the quartette conjointly amounts to.

That there are grievances in this direction few will deny, emphasised the more that now and again some happy examples of this *quid pro quo* are told in Gath, bringing into more forcible contrast a great deal that is seen and felt, but mentioned only with bated breath from over the garden wall. The force of good example is not under-estimated, and all honour to the few who in spontaneously adopting the live and let live principle acknowledge that the gardener is a man worthy of his hire.

This is good so far as it goes, but it neither goes far enough nor fast enough to reach and keep up with this age of push and progress; and it wants pushing. The thing, however, is too big, too weighty, ever to advance save by infinitesimal degrees under individual effort or isolated example, and until the whole gardening fraternity agree upon concerted action will, practically, "get no forrader."

Union is strength. In a great combine lies the crux of the question, and that, as a remedy, presents itself to most minds in the form of a scarecrow, so enwrapped in the miserable rags and tatters of hardship and failure which trades' unions have left in their track as to frighten the peaceable gardener from even its contemplation. So gardeners think of it and shrink from it in the vague hope—that hope which springs eternal in the

READERS are requested to send notices of Gardening Appointments or Notes of Horticultural Interest, intimations of Meetings, Queries, and all Articles for Publication, officially to "THE EDITOR," at 12, Mitre Court Chambers, Fleet Street, London, E.C., and to no other person and to no other address.

human breast—that somehow, at some time, things will right themselves; and, of course, there is the friendly advice always to hand, if he does not like it he can leave it. Is he not free? Yes.

Free, yet in fetters held till his last hour,  
Gyves that no smith can weld nor rust devour.

A poor consolation, a wretched remedy. But "our remedies oft in ourselves do lie which we ascribe to heaven." In the dim and distant future things may right themselves, but benefits which are wholly and solely for posterity do not commend themselves as grateful or comforting to those bearing the burden of their own particular day.

Granted that the only remedy lies in concerted action, why is it such a hideous thing to contemplate? Surely from the misunderstanding that such will result in setting class against class, master against man. Is it not a common mistake springing from other lines of life in the working world, but from lines which do not run parallel with ours? And is it not a stupid mistake? Difficult to deal with, for, as Schiller says, against stupidity the very gods fight invictorious. However, it is hoped our case is not so hopeless as that; yet it is strange, passing strange, that whenever this theme is broached a vision of strikes and all that follows in their wake blinds the sight of otherwise far-seeing men. Ere attempting to focus the matter on a less distorted mirror, it may be as well to consider the grievance under its four heads, for to be clear and defined in the knowledge of what is wanted is, in a measure, paving the way to obtain it, and "Thrice is he armed who hath his quarrel just."

Wages, at first sight, impress one as being the most important phase of the question. With some it is the alpha and omega of it, and "nothing comes amiss (bad lodgings, long hours, and no holidays), though money come withal." The very nature of a gardener's work prohibits all hope of its ever being directly measured by money. He is so indissolubly bound up with it—his work—that it is impossible to see the dividing line between his own time and his master's: impossible, for there is none, and when he is not actually working he is thinking and planning for its advancement, not his own. The man who can switch off gardening from his mind at home, at church, or anywhere else, at any time, morning, noon or night, is a *rara avis* seldom caught, and when caught will be invariably found posing under borrowed plumes and only a counterfeit of the true garden variety. A liberal-minded master (liberal-handed, too) was wont to say a gardener's work is never done, and never paid for. Would that there were more such masters, for hosts of men, and good men too, are working for a pittance but little more than a labourer's pay.

The wages question is, of course, open to arguments *ad libitum*, and might be prolonged indefinitely, but *cui bono*? A gardener's work is not reducible to a fixed quantity, and the mass of facts which might be advanced are superimposed upon the principle that it cannot be measured by money.

The lodging, cottage, house, bothy, or whatever style or title our gardener-tenant chooses to dignify his dwelling by, must always be considered an important part of his *quid pro quo*. Masters who have provided their men with comfortable, decent, and adequate accommodation in this respect are, it is feared, the exception rather than the rule; and many a man who holds a fairly good position in the gardening world is quartered in a scanty, ill-built, badly situated structure detrimental to his physical welfare, his own self-respect, as well as being derogatory to his rank as commander-in-chief of the gardening staff.

Men are oftener judged by the house they inhabit than by the clothes they wear or the wages they are paid. There has been but little or nothing said about the head-gardener's abode, whilst there has, of late, been much talk about the young men's quarters—the bothy. Plans of bothies, and prizes for them. Illustrations of fine bothies and glowing descriptions of the benefits conferred on those who dwell therein. Baths, reading-rooms, separate dormitories, inside; cricket pitches and what not outside, that those who hear the praises trumpeted forth of these generous doings for young gardeners may, in the spirit of emulation, go and do likewise. Very good; very good indeed, so far as it goes, but it does not go far enough when the unselfish gardener, having shown his visitors this spirited example of thoughtfulness for his pupils, feels constrained to offer an apology for his own poor habitation when entertaining them in it (which has actually occurred).

The spirit of loyalty which prompts men to invent all

sorts of excuses to shield masters from the onus of shortcomings towards themselves is commendable, commendable to a fault. Were ever men so utterly unselfish where they themselves are concerned? I trow not. Truly, they make the best of things, even comforting themselves with the polite fiction of heading their correspondence "The Gardens," when perhaps dwelling outside in the background or domiciled in a gate lodge. A few who follow these remarks may, of course, have in their mind's eye some head-gardener's house really worthy of the man and his position; if so, perhaps they will kindly keep it there—in their mind's eye—for use ere conclusion.—QUIZ.

(To be continued.)

## Bedding in London Parks.

Each year the Royal parks of London attract hosts of gardeners, whose chief object in visiting them is to note the high-class bedding. But for one that has the privilege of seeing the actual bedding, a hundred have not; and for all such, the following notes may stand in stead. And even though the choice bedding cannot be very generally followed, one likes to read of the achievements in this line, and, so far as circumstances may permit, to follow it.

### Hampton Court.

stands in the front rank as a place where choice flowering and foliage plants are arranged with experienced and well-trained skill by the superintendent, Mr. J. A. Gardiner.

The long flower border facing the fountains is a splendid pattern of an English summer garden display in these days. The groups or masses of plants would possibly be more effective if planted in larger breadths, but the show at this season cannot fairly be criticised.

On the brick wall which backs the border we find a continued series of rampant, healthy climbers, which include Roses, Vines (*Ampelopsis*), *Clematis viticella* varieties, and also the Traveller's Joy; also Everlasting Peas, *Magnolia grandiflora*, *Kerrias*, and other subjects; the little Toadflax, too, clings thickly from every seam.

The border itself, which is broadly margined with smooth grass, and has a line of variegated Cocksfoot Grass and purple Pansies all along the front, contains showy masses of the following plants, named as we walk along. Be it noted that all the taller plants, *i.e.*, *Humea elegans*, *Montbretias*, *Hydrangea Hortensia*, &c., are not in the middle or at the back, but some brought forward to give breadth to the view. Thus: Single and double Hollyhocks in endless variety (at the back); with *Lilium tigrinum*, *Plumbago capensis*, Sunflowers, *Fuchsias* galore, particularly fine being *F. gracilis*; Maize, *Abutilons*, *Salvia splendens*, and *S. Horminum*; *Begonia fuchsioides*, *ascotensis*, *weltonensis*, and tuberous varieties; *Solanum jasminoides*, *Dahlias*, *Heliotropes*, *Iresines*, *Lantana delicatissima*, *Phloxes*, *Lilium Harrisii*, *Nicotiana sylvestris*, *Streptosolen Jamesoni*, *Erigeron speciosus*, yellow Privet, *Miscanthus gracilis* (*syn. Eulalia*), *Cosmos bipinnata*, *Alocasia antiquorum*, *Abutilon Savitzi*, *Kochia scoparia*, the recently "discovered" swamp Cypress, and besides these there are *Asclepias tuberosa*, *Pentstemons*, *Antirrhinums*, *Hemp* (at the back), *Acacia lophantha*, *Galega officinalis* and *alba*, Ivy-leaved and Zonal *Pelargoniums*, *Bouvardias* (*Humboldtii corymbosa*, and others); *Hydrangea paniculata*, *Ricinus Gibsoni*, *Verbenas* (dwarf); *Gladioli*, *Cannas*, *Celosia pulmosa*, *Coreopsis tinctoria*, *Senecio clivorum* (new), *Kalosanthes coccinea* (in front masses), *Verbena Miss Willmott*, *Tagetes lucida*, a dwarf yellow species; *Salpiglossis*, *Justicia carnea*, *Lobelia cardinalis*, *L. syphilitica*, *Arctotis grandis*, *Francoa ramosa*, *Agapanthus umbellatus*, *Alströmerias*, *Achillea "The Pearl"*, *Gypsophila*, *Malopes*, *Oenotheras*, *Monardas*, *Asters*, *Poppies*, and *Pyrethrums*.

The beds, even in such a sunless year, are very bright and fresh, the combinations in some of the best being formally noted hereunder.

1. A large, flat, oblong bed (27ft by 15ft) was exceedingly rich with selected varieties of crimson and scarlet tuberous *Begonias*, remarkable for their erect, bushy growth, with large flowers and great floraison. Mixed with them was Golden Feather *Pyrethrum* and *Fuchsia gracilis*; also a good sprinkling of *Grevillea robusta* (1½ft high), and *Solanum Warscewiczii*. The bed was edged with *Echeverias*.

2. Foliage bed (27ft by 15ft): *Acalypha musaica*, dense and strong, 2½ft high, at each corner, sides, and middle. *Iresine Herbstii*, and *I. Lindenii*, over 6ft, and pyramidal *Lantana delicatissima*, fourteen large plants. *Abutilon Savitzi*, seven plants. Also golden cut-leaved Elder, *Fuchsia gracilis*, and *Grevilleas*, the whole edged with *Anthemium Liliago variegata*.

Some of the other beds will be noted, along with the Hyde Park and Regent's Park bedding, in a succeeding paper.—J. H. D.

### "Briaring."

I have had my say on Briar standards, and am tempted by its courteous reception to have my say about "Briaring," especially as November will soon be in sight. "Briaring" is a very cheap and pleasing way, for those who can take it, of enlarging one's Rose garden. After the first year I quite gave up taking out a spade: a very small and handy mattock and a small saw I found quite sufficient. Instead of hammering away at huge old stocks, we looked out for two-year seedling plants, and seldom spent time on any that were deeply rooted. I say "we," because my "groom and gardener" factotum was equally enthusiastic, and soon became very skilful. He had knowledge as well as zeal, which is always desirable. "Have you shaken the post, John?" "No, sir, but I will!" is perhaps zeal without discretion. Nor did that other cleric fare much better, who forgot the alms-dish, and sent John, who was also verger, into his study for it, with the result that he took the silver biscuit tin and brought it up to his master with the plaintive remark: "Been all round sir, but they won't none of them have any" (!)

There are Briars *and* Briars, as has just been remarked, and a personally conducted tour of the kindly lent hedge admits of a careful and needed selection. My experience was that the smooth-wooded Briars were almost invariably very inferior, and that the more prickly the stem the more satisfactory the produce. One other plan of mine I will mention, as neglect of the precaution accounts for many sickly and dying Rose stocks. After budding, and when the height of the standard was absolutely decided, I used to apply a styptic to the open wound at the top, where, unless the bud be an extra strong grower, it will not bark over, and is liable to die down. I give my recipe. Styptic for Rose-stock wounds:—

9 ozs. of pitch	1 oz. of leeswax
1 oz. of resin	1 oz. of tallow

Put in a glue pot, melt together over a slow fire, and apply hot. This mixture is also useful in late pruning when there is any tendency to bleeding.—A. C.

### Briar v. Manetti.

So "Briar v. Manetti" has not lost its ancient power of stimulating correspondence and argument. Well, I am still ready to take a part, as I was a quarter of a century ago. I did not suggest that I would "sweep away the Manetti from the face of every professional Rose garden," but that it was "useful for indoor propagation and for such strong growers as Crimson Rambler and Penzance Briars," though I thought it should not be used even for these. The Penzance Briars will, I suppose (I have not tried, as I do not grow them, considering them ridiculously over-rated) strike as easily from cuttings as other Briars. The Manetti is, or, at all events, has been, of enormous use to Rose-lovers for winter grafting. Without it, amateurs would have had to wait much longer for the dissemination of new varieties. I have also seen large breadths of plants budded on it in Rose nurseries, but have generally been told they were for America, or some such use.

"Herefordshire Incumbent" gives a quotation from Mr. William Paul's "Rose Garden." Let us have another—9th Edition, p. 167, year 1888:—"The Manetti is desirable for Roses in pots, and admissible for hardy kinds when an extremely vigorous growth is desired. It has been recommended for kinds of delicate growth which do not thrive well on the Dog Rose, but my experience does not uphold the recommendation. If a change of stock is necessary for such, it would seem that one of a *finer*, *not coarser nature* than the Dog Rose should be employed. That the plants grow more vigorously on the Manetti the first year we do not deny, but their subsequent decline is also more rapid."

The italics are Mr. Paul's, not mine, and the popularity of the Briar cutting as opposed to the Manetti has immensely increased since 1888. "Herefordshire Incumbent" gives another quotation from a writing "in the beginning of the 60's." I do not think Briar cuttings were used at that time. I knew how to prune a Rose then as well as I do now; but, at any rate, we have learned something, I hope, in the past forty years.

I am much surprised at the statement of the foreman at King's Acre Nurseries. Does not he use Briar cuttings, and raise them himself? But I am almost inclined to think that my courteous opponent thinks I was comparing Manetti with the Briar standard, as he speaks of the King's Acre Nurseries purchasing stocks; whereas, of course, I was comparing it with the Briar cutting. "A. C." and I do not purchase our standard stocks, but get them with our own hands. I have budded some standard

stocks every year, I believe, since about 1874, and never one to the best of my knowledge that I did not get out of a hedge with my own hands.

Does "Herefordshire Incumbent" read the Journal every week? It was not I, but "Surrey Hills," who "introduced the subject of budding on the Manetti stock four inches below the ground." I admit that the parallel of too-deeply planted Roses putting out roots on the shoots, and Vines throwing out aerial roots is not strictly analogous. He may call it a hastily-written and ill-considered simile, but each is an effort of Nature to remedy want of health and an unsatisfactory state of things. And "the conclusion of the whole matter from the writer's point of view" is that the Manetti is *not* an "all round indispensable stock." Certainly not "all-round": I thought all admitted that; and certainly not indispensable for amateurs, for I have dispensed with it for many years, and intend to continue doing so.

I have given it good trial; yes, and I have had those grand-looking maiden plants on it 6ft high, but with uncommonly few good blooms on them. With me, as with Mr. William Paul, they did *not* form "grand cut-backs next year," but their "decline and fall" was more notable than their rise. I should very much like to show Roses from my Briar cut-backs against those from the Manetti cut-backs of my brother Incumbent in the West; but Rose shows in that part of the country are too far for me now.—W. R. RAILLUM.

## Kingswood (Bristol) Show.

(See Illustrations on pages 215, 217.)

The Kingswood Show was again favoured by good weather on August 20, with the result that there was a splendid attendance, which must in itself be very encouraging to the secretary, Mr. Truebody, and his committee, who, after a hard fight, have succeeded in establishing an annual show in this rising and thickly populated suburb of Bristol.

The silver cup presented by the society for the largest number of points in the open was won by Mrs. E. Jefferies, of Clifton; and a gold medal for the highest number of points in the plant classes was secured by Captain Belfield, of Frenchay.

The competition in most of the classes was very keen, principally in the group of plants arranged for effect, the premier award being awarded to Captain Belfield (W. Rye, gardener) for a very pretty combination, principally yellow and blue. The Dahlia being a favourite flower in the district, there were numerous exhibits, the judging of which had to be taken by points, so close were the merits of the blooms.

The fruit entries were few, and the fruit, with the exception of a collection, and the Peach and Nectarine classes, was of a very poor quality, the late inclement weather having much to account for. In walking round the outlying district previous to the show, it made one feel melancholy to see the smallness of the crops of fruit; just one Apple or Pear peeping out here and there among the leaves. The crop of Plums was totally lacking.

The cottagers' classes were decidedly good, the exhibits in many cases being far superior to those in the open. The judges were: Open classes, Messrs. Iggulden, Smith, Bannister, Rye, and Gairaway.

[Hereunder our reporter, who also took the photographs from which our illustrations were reproduced, supplies notes on the subjects figured at pages 215 and 217.—Ed.]

Six bunches of cut flowers. The winner here (class 10) was R. Eager, Esq. (gardener, F. Cave), Northwoods, near Winterbourne, Glos. Mr. Cave had Cymbidium Lowianum, Cattleya Harrisonæ, Allamanda Hendersoni, Cattleya granulosa, Epidendrum vitellinum, and Cypripedium insigne. Mr. W. Rye, gardener to Captain Belfield, Frenchay, near Bristol, was second. This is the first occasion for ten successive years that Mr. Rye has been defeated in this class, and even now it is by one of his old assistants, who, if I am not divulging a secret, rather chuckles at being able to turn the tables on the veteran grower, whose stand was well up to the average, but a staging of excellent Orchid blooms carried more weight, hence his defeat. He had *Pancreatium fragrans*, *Anthurium Andreanum*, *A. Ferrierense*, *Gloriosa superba*, *Statice profusa*, and *Eucharis amazonica*.

Dish of Peaches. For a well-coloured dish of good fruits (variety *Crimson Galande*) in class 24, Mr. E. W. Towell, gardener to Mrs. Gale Coles, Downend, was the leader.

For a collection of fruit in class 21, a Mrs. E. Jefferies was foremost, having representative samples of Moor Park Apricots, Noblesse Peach, Magnum Bonum Plum, Muscat of Alexandria Grapes, and a Melon.

View of the Epergnes. Though the photograph is not so clear as we should like it to be, the reproduction on page 217 affords a fair idea of the decorated epergnes (side view). They were quite a fine feature of the exhibition.

*Disa racemosa.*

The Disas are confined chiefly to South Africa. Under glass-house culture they succeed best when given a cool, moist, airy, rather shaded position, and a liberal supply of water all the year round. For compost, use good fibrous peat and sphagnum, with perfect drainage. The species we figure flowers during June or July, having flower stems 15in to 24in high, and the flowers are rose-purple.

#### The Week's Cultural Notes.

Growers of Moth Orchids, as the *Phalaenopses* are called, have this season had anything but a pleasant time of it, long spells of dull and wet weather relieved by only a few sunny days not being at all conducive to the health of these heat and light loving plants. It is not exactly a question of temperature, as this is easily arranged; but no amount of fire heat or judicious moistening can compensate for the loss of the brisk, buoyant heat caused by the sun striking on the glass. Make the most use of the sun heat and light by always keeping a little warmth in the pipes and slight ventilation on top, this keeping the leaves comparatively dry, and allowing of the blinds being kept up until almost the middle of the day.

One of the most difficult members of the genus to cultivate is *P. Lowi*, and plants that are weak and poorly grown now stand a poor chance of coming through the ensuing winter in safety. In many cases this plant is quite deciduous, losing its leaves quite early in winter. There is then all the more need of care now, that the crowns and foliage shall be well developed and the roots attain a good hold on the moss or block on which it is grown. Different specimens behave in rather different ways under cultivation, making it necessary for those in charge to study the needs of each individual plant and vary the treatment accordingly, not treating all alike, whether growing, resting, or preparing to rest.

When only a small number of plants of *Cypripedium Schlumi* are grown it is very seldom out of flower, and possibly this accounts for its somewhat weak constitution. They are lovely little flowers, and one hesitates before cutting them for the sake of the plant's health, though it is strictly necessary for weak or badly rooted specimens. When well rooted and established there is little trouble as a rule. There is no doubt that *C. Schlumi* likes a very abundant water supply all the year round, and the whitish muddy deposit often seen upon the leaves of imported plants shows that they grow naturally in swampy positions.

The temperature for *Schomburgkias* that are throwing up their spikes may be raised a little if these seem slow in opening their flowers. In a cool house I have known *S. tibicinis* to be so long thinking about it that eventually they never opened at all, and the strength of the plants was wasted upon a barren and useless spike. Pulling the roots about at this late season would have the same effect probably; at all events, it is unwise to do so. *Lælia superbiens* is very similar in habit, though, of course, much larger growing, and here the same thing applies.—H. R. R.

#### \* The Travels of an Orchid Hunter.

(Continued from page 188).

"The *Cattleya Trianae* has been found for years near the town of Ibaguë in the State of Tolima—a little more than one hundred miles from Bogota, in a south-westerly direction. This *Cattleya* is found under much the same circumstances as the others of its family, at an altitude of about 4000ft above sea-level. To reach it, it is necessary to ascend the river Magdalena for a considerable distance, and then land on the west bank. There is little of interest in the mule ride except the sight of the majestic snow-capped mountains, called the Paramo de Ruiz. These tower up to the height of 16,000ft, with a glistening top of eternal snow, which makes them conspicuous at a great distance from many parts of the road. *Cattleya Trianae* is found over a wide area, but all the plants taken from these parts, as well as from Pacho, La Palma, &c., must be brought to a small town called Honda; this is the principal port of the Magdalena river, about 600 miles from the sea. Swift running rapids prevent the larger steamboats going further up the river than Honda, but another line of boats has been built above the rapids. These vessels navigate the river for 300 miles more to a place called Neiva. Hundreds of mules, carrying every imaginable class of produce, throng the road from Bogota to Honda. On arriving on the banks of the Magdalena everything in the way of cargo, animals, and human beings that would reach the town must embark in a curious kind of raft, attached to a strong chain stretched across the river. Immediately the raft is loosened from the side, the force of the water carries it across the

river, the pulley running along the supporting chain. This raft is worked from six o'clock in the morning until six in the evening, the small fee of twopence-halfpenny being charged for passing a horse and his rider, three-halfpenny for a mule load, and a penny for a foot passenger.

"A line of railway connects this place with the town of Honda, and runs to the part of the river where the steamboats land, called Yeguas, about four miles from Honda. At this point the mountains, which wall in the valley of the Magdalena, are very near to each other, and there seems to be no breeze whatever reaches the town; it is proverbially known all over the country as being very hot, and I have seldom seen the thermometer fall below 95deg., Fahr., in the shade. It is a curiously built little town, with neither system nor design in the architecture. It was at one time large and important, but earthquakes have proved its ruin, and now the fine churches, convents, hospitals, and even a beautiful stone bridge, have all been destroyed. Travellers to the interior must inevitably pass this way, and everyone will find lodging-houses and facilities for hiring mules, &c., to help him on his way to the capital. When I got on board the steamboat here to descend the Magdalena river, I practically said good-bye for the time being to four States of this magnificent country—Boyaca, Cundinamarca, El Cauca, and El Tolima. No pen or picture has or ever will be able to give more than a faint idea of the glories of this part of Colombia—of its riches in mines of emeralds and gold and silver; of its agricultural products of coffee, cocoa, and grain; of its trackless forests, with their exhaustless supply of timber and choice woods, its wealth of ornamental and medicinal plants, its bevy of gaudy coloured birds and curious animals, its snow-capped mountains and boundless prairies where the Indians have always roamed with perfect freedom: or of its commercial cities, with their rich and cultivated inhabitants. Even the most stoical Englishman who has travelled here and seen its beauties cannot help but regret that so many thousand miles divide this paradise from our own little island.

"The descent of the river Magdalena was made quickly and agreeably, and we very soon arrived at the port called Puerto Berrio. This is the port by which travellers reach the prosperous city of Medellin, one of the most important centres of the country, and the home of *Cattleya Dowiana aurea* and *Cattleya Warscewiczii*. Puerto Berrio has a special interest to all English Orchid collectors. A rough cross of wood on the edge of forest, on the higher bank of the river, marks the last resting place of Chesterton, the well-known Orchid collector, who did such good service for the firm of James Veitch and Sons, long before the wholesale plunder and extermination of the plants brought about by modern collectors.

"A small mountain town, called Frontino, has given, up to the present, all the *Miltonia vexillaria*, but the woods in the vicinity have become already pretty cleared. I had heard much about the plants to be found between the river Opon and the river Carare. These are two rivers which together drain the southern part of the State of Santander, and the land lying between them is a narrow strip less than one hundred miles wide. I descended the river to a place called Barranca bermeja, with the object of getting a canoe to navigate the river Opon. This, I was told, would require at least six men, well armed. The river is not navigable for more than fifty miles, and the distance is intercepted by fallen trees, while the forest between the two rivers is infested by hordes of hostile Indians. The first two days nothing extraordinary happened; the banks of the river were thick forest, and we saw no tracks of the Indians. Each night we camped on a sand-bank. I saw no Orchids, the land being too flat; but on the third day we passed many tracks of the Indians, and some abandoned huts. About mid-day, as we suddenly made a curve in the river, a shower of arrows whistled past us and fell far ahead; they had been aimed too high and shot with too much force. In the direction the arrows came from we saw nothing—not even a rustling of the foliage. We fired several times into the bush, and proceeded more cautiously. My companions would have turned back, some of them becoming afraid, but an unconquerable curiosity possessed me to see what there was in the way of plants on the higher ground. It was evident that the Indians knew by this time, all along the river, of our ascent, and more than once I saw dusky forms creeping stealthily away from the banks as the canoe glided in sight. I had been informed that the Indians were very much scattered over the country, and although they maintain a deadly hatred against all civilised human beings, the fact of our ascending the river would not be sufficient to make them congregate in numbers, and the stragglers along the banks, although hostile, are cowardly and afraid of fire-arms.

"On the fourth day, proceeding with great difficulty on account of the fallen trees, we came to some three or four small sheds, with plantations of maize in front of them; a few animal skins were lying about, but every one of the inhabitants had taken to the woods. The very emptiness of the huts showed that their manner of life must be of the most primitive kind. However warlike they are towards outsiders, there are accounts that they live together in the greatest friendship and good faith. We left the huts very much as we found them, and proceeded up the river. I had seen several very pretty *Oncidium*s on the banks, and I had begun to hope that we were clear of the Indians. On the night of the fourth day, we camped, as usual, on a sand-bank, not being able to proceed further on account of the bad state of the river. Knowing that we were in the very middle of the Indian territory, where, if they chose, they could overpower us

with numbers any moment, we passed the night somewhat nervously, with a very small fire, but with our rifles loaded, and while three slept the other three kept watch. Nothing happened to us that night, and early in the morning, after breakfasting, I started into the forest with four of the men, leaving the other two in ambush to watch the canoe, for fear the Indians should take away our only means of getting back to the Magdalena. I was delighted to find the trees on the rising ground from the banks of the river hung with fine clumps of *Miltonia vexillaria*, intermixed with *Oncidium Carthaginense* and several smaller Orchids, and I was priding myself upon reaping a glorious harvest. But that night all my plans were destined to be crushed. Everybody was in good spirits at our evening meal, but we had scarcely finished and lighted our roll of tobacco when the twang of an arrow, as it whistled past my head, startled everyone to his feet. In another moment one of our number was pierced with three of the deadly poisoned arrows, and mortally wounded. The moon was on the wane, and shed a miserable light for us to shoot by, while the savages could see us perfectly well by the light of our fire. Not a moment was lost in hiding ourselves behind the nearest trees, and we were scarcely placed when another shower of arrows showed us the position of the Indians. Seeing us retreat, they had advanced more into the open; at the same moment a blaze of fire poured out of five trusty rifles, and a terrible howl rose from the throats of the surprised and wounded Indians, who up to the present had not uttered a sound.

"In a moment every mark for us to aim at had disappeared, but we fired another volley in the direction they had gone. For some time after, the rushing sound in the forest informed us that they were retreating and taking away their dead or wounded. I thought they would return, but my companions believed that the report of fire-arms was so little known to them that one encounter would be enough—and they proved right. As soon as day dawned we carefully reconnoitered in all directions. However, on that side we found nothing but the trail of the Indians and the pools of blood left by the victims of our bullets."

## The "Daffodil King" on Tour.—No. 10.

(Continued from page 193.)

Invercargill is one of the most recent of the important townships. It is from here that one makes arrangements for visiting Tasmania or Melbourne. Both here and at Christchurch and Dunedin Mr. Barr was asked to talk "Daffs." to the enthusiastic amateur gardeners, of whom there are a good many. Each place has its horticultural society, which is more or less prosperous. At Invercargill considerable alterations and extensions are likely to be made to the gardens and public grounds.

Wellington, the capital, is very limited in space, and curiously, the town stands on reclaimed land. The large steamers come close up to the quay to discharge and take in cargo. The surrounding hills form the better-class residential part of the town. As there is a general ambition amongst New Zealanders to make Wellington the commercial, as well as the legislative, centre, wholesale houses are moving their principal establishments to this place.

Here they have a so-called botanic garden, but it is a reserve more intended to keep the native trees, than to bring in exotics. By making walks throughout, the townsfolk have the benefit of the country air, which is fresh, as the situation rises to a considerable height. The recently appointed superintendent is a Mr. Glen, an old English gardener, who now occupies the house and property used by Mr. Bailey, now the Queensland botanist. It is a very pretty place, but unfortunately subject to floods.

One of the keenest Daffodil growers at Wellington is a Mr. Mason, an old Quaker gentleman, whose collection comprises many of the very earliest of English seedlings, which at home have been long ago discarded. His garden is one of the show places of Wellington, and every distinguished visitor is taken to see it. According to the amount of interest his visitors display, the owner devotes attention to them; and should they happen to have little touch with horticulture, he soon runs them round, and bids them Good-bye! Close by, a Mr. Gibbons carried on a nursery and seed business; and also near at hand there is an old Chiswick man owning a number of vineries, in which he grows Grapes and Cucumbers for market. This marketman (Mr. Waugh) was also a pupil of the late Malcolm Dunn, of Dalkeith.

At the time of Mr. Barr's visit to this part of New Zealand, there were no excursions to the great fiords, and he was unable to explore them. Instead of that he had a carriage ride through the mountainous parts of Wellington to the Wairapa. He describes the scenery and the foliage as grand, and he frequently came upon large patches of *Ranunculus Lyalli*, in its native quarters; also of *R. insignis*, on Mount Lyall, where the well-to-do people of Christchurch, who may be botanically inclined, usually spend their Christmas holidays. At that (the warm) season, the fields are usually covered by these two species.

New Zealand is not remarkable for its nurseries. Auckland has a nice little establishment; and here the veteran traveller saw the Japanese Plums more beautiful than at any other place, the trees being literally bent by the weight of fruits. Both

Dunedin and Christchurch have some small nurseries; but the largest seen by Mr. Barr was at Invercargill.

Mr. Barr's entry at Tasmania was at Launceston, "a remarkably nice town," where he was at once taken in hand by the Daffodil enthusiasts, some of whom possess many of the most expensive varieties.

*Disa racemosa.*

#### A New Carnation, Mrs. Lora Armstrong.

We have been favoured with specimen blooms of this new Carnation from Messrs. Wm. Watson and Sons, Clontarf Nurseries, Dublin, who send the following letter: "For Carnation Mrs. Lora Armstrong, we received the certificate of the Royal Horticultural Society of Ireland at the autumn show in Dublin, August 25. These blooms were cut on Monday by the gardener who raised the variety (Mr. J. Dowling, gardener to Mrs. Lora Armstrong, Carrickmines). We are sorry we have not fresh flowers, but the fact that they were cut then and staged yesterday will give assurance of the lasting qualities of the flower. You will notice the stout erect stems and thoroughly vigorous style of this hardy border variety." On arrival here the flowers were perfectly fresh; and what will attract attention at once will be the distinctive rich colour of the novelty. We are not far out if we describe the colour as a brick-red salmon. The blooms are of good medium size, smooth of petal, full and even, nicely scented, and possess a truly non-bursting calyx.

#### The Garden City.

Having secured a site for its first enterprise, the Garden City is in a fair way of passing from the nebulous condition of a benevolent dream into that of actual fact. An estate 4,000 acres in extent, near Hitchin, on the Great Northern Railway, and lying a little to the west of Baldock, is to be converted into the first Garden City. A sum of £50,000 was necessary to enable negotiations for the acquisition of the land to be completed, and this being forthcoming, an arrangement has been come to. The new Garden City will be within an hour's railway run from London; it stands from 250ft to 300ft above sea level, and is furnished with an abundant supply of water. But, having obtained the land, more money is needed to make a start with the foundation of this modern Utopia, where overcrowding and high rents are to be unknown, where smiling gardens and open spaces are to predominate, and where intellect and morality are to be the most prominent cults. Those anxious to embark in the enterprise are, however, frankly advised that they must not at this present state regard it as a safe investment, which is, at all events, honest, since it is, perhaps, too much to hope that the Garden City will prove at once an El Dorado and Utopia.

#### A Floral Arrangement.

The illustration on page 221 serves to show how flowers of different forms can be gracefully disposed and effectively posed, even though they are just common border varieties. The illustration is a sketch of a cottager's bouquet, and certainly it looks well "on paper," if it was criticisable in the original.

We have passed through the show season—at any rate, the summer shows are past—and we have all seen very different models in the floral classes. The bride's bouquets are very popular, but the table bouquets are seemingly out of favour, as well they might be, for they are stiff affairs. Bouquets have undergone considerable alteration in design during the past fifteen years; or it may have been that styles vary with districts. Going back to other days, the making of the show bouquet was an interesting event. Half a dozen of us would be wiring the flowers; one would be handing them as the maker wanted, and attending to the supply of raffia; and as the sides of the bouquet grew outward, and its form and finish began to show, the general interest rose, and suggestions and criticisms were rife. But the master-hand had won many a first prize, and he would neither be led nor driven: so the criticism fell flat, and the bouquet was at last admired by all. "She's gie nice." "A wee bit slack there." "Is that Rose no on the heavy side?" would be some of the comments to be heard.

We do not hold ourselves experts in bouquet making, but we have some opinion of our skill at wreaths. Possibly some of our friends may be drawn by this note and our simple illustration to lend their help, through these pages, in "bouquet making." We will welcome their notes, so will many of our readers. Books and writers on this important branch of art are too scarce.

#### Columbus's Tree Dying.

The sacred Ceiba tree, which Columbus is said to have planted in Havana, is dying, and the Temple, where the remains of the great navigator have for centuries been guarded, is crumbling away, and may soon be reduced to a heap of ruins. Yet neither the State nor the municipal authorities appear to be taking any particular interest in these facts. The old tree began to wither during May last, its branches withering one by one, until now it has scarcely a leaf upon it. A shrewd American in business in Havana is endeavouring to purchase the tree, with a view to sending it to the St. Louis Exhibition, and afterwards cutting up the tree into relics. The Bishop of Havana, however, hopes, in the event of the death of the tree, to secure the remains for the Catholic Church, whilst the Spanish Chargé d'Affaires thinks it ought to be presented by the Cuban Government to the Duke of Veraguas, Don Cristobal Colon, of Seville, Spain, the lineal descendant of Christopher Columbus.

#### Kadsura japonica, a Handsome Shrubby Climber.

This is a plant, like too many more, that is less met with in the greenhouse or conservatory than it deserves; in fact, it is in very few collections outside the precincts of a botanical garden that one does meet with it. It is, however, I think, worthy of a corner in every conservatory, or on a wall out of doors, as at Kew. Being a climber, with large and coriaceous foliage, not unlike that of the Eurya japonica, it is very suitable for the decoration of pillars, and to which it imparts a massive and pleasing effect all the year round. True, the flowers are relatively inconspicuous, but they are also exceedingly interesting on account of the Strawberry-like protuberances which form the receptacles. The flowers in appearance resemble the Magnolia. The petals are creamy white, and contrast well with the red and pink centres. The plant, as will be seen by the specific name, is a native of Japan, is half-hardy and evergreen. I believe that it is impossible to survive the winter with protection in some parts of Scotland. It is usually propagated by cuttings of half-ripened wood or divisions of the root, and does not appear to be very particular with respect to soil. A sprinkling of sand and peat, however, tends to produce a more prolific display of flowers. Altogether, the Kadsura merits more and general notice among gardeners for the above mentioned purpose.—D. C.

#### Fuchsias as Bedding Plants.

Among the scores of summer bedding plants employed throughout the country, I believe that none have stood the test of this uncongenial summer and retained their brilliancy so well as the Fuchsias, and I believe that they are gradually gaining favour as summer bedding plants.

Under no conditions can their handsome, pendulous blossoms be so efficiently displayed as when trained as standards or in pyramid form, and used over a carpet of Violas or Pansies, or any dwarf growing plants that will harmonise or contrast with the colour of the Fuchsia employed. Varieties that have a tendency to trail should be discarded if standards are wanted, but those like F. tricolor and F. Sunlight can be used as edging, or beneath the taller, upright flowers. Such robust kinds as Rose of Castille, Mrs. Marshall, Mrs. G. Rundle, and Searcity are robust growers. Select cuttings at any time of the year, if placed in gentle heat, will root readily, and should be encouraged to make one strong growth, removing all side breaks until the desired height is attained, supporting this with a stout stake, when they may be allowed to break away and form a good head.

Fuchsias that have been employed in this manner here have been a mass of flowers from the third week in June, and have every appearance of remaining so until the beds will be required for spring bedding subjects. Cuttings of the variety Searcity taken now and allowed to make a shoot of about a foot in length by the time the bedding for summer effect comes around, will be found handsome for planting, slanting form, in stone basins or vases, letting the pendulous blooms hang over the sides all around. Ivy-leaved Pelargoniums from cuttings taken now, and intended for standards or pyramids, will have to be grown on twelve months, when they may be afforded a slight rest during the winter previous to bedding them out, by laying them on their sides under the stages of the greenhouse. Pot them up, and bring them to the light in January twelvemonth, when they will be good for summer 1905. Of course, this is for large plants.—CHAS. J. ELLIS, Warren House Gardens, Stanmore.

## Glenville Gardens, Waterford, Ireland.

There is no more charming place on the banks of the River Suir than Glenville, the palatial residence of Alderman W. G. D. Goff, J.P. It is within easy distance of the ancient city of Waterford, and is

**Kingswood Show : First prize fruit collection.**

remarkable for its beautiful pleasure grounds. There are several expanses of water around the dwelling-house which have been planted by the present head gardener with the choicest varieties of Water Lilies, supplied by Messrs. Dreer, the celebrated raisers of aquatic plants, of Philadelphia, U.S.A. A number of the Nymphæas are now in flower, and they are certainly well worthy of a visit.

Glenville Gardens have long been famous as one of the very few Irish establishments that cultivate Orchids well. Mr. Innes very kindly eiceroned me on the occasion of my visit to Glenville. The Orchid house is a splendid structure, no expense having been spared on the erection and completion of same by the worthy owner. Amongst the collection of Orchids the following struck me as being worthy of note: *Thunia Marshalliana*, *Cattleya labiata*, *Brassavola Digbyana*, *Oncidium ampliatum majus*, *Gongora atro-purpurea* (the Punch and Judy Orchid), *Dendrobium chrysotoxum laurissimum*, *D. Wardianum*, *D. thyrsofolium*, *Oncidium Papilio majus*, *Aërides odoratum*, *Odontoglossum vexillarium*, *Anguloa Ruckeri superba*, *Dendrobium infundibulum*, *Lycaste Skinneri*, *Odontoglossum citrosum*, *Epidendrum prismatocarpum*, *Lycaste Deppei*, *L. xytriophora*. There is an immense variety of *Cypripediums*. I saw some fine specimens of *C. Mastersianum*, *C. niveum*, *C. callosum*, *C. Rothschildianum*, *C. Exul*, *C. Lawrenceanum*, *C. Lowianum*, *C. Chamberlainianum*, and *C. barbatum*.

Mr. Innes showed me a magnificent lot of *Cypripediums* of his own raising. What took my fancy was the scrupulous neatness and cleanliness of the Orchid and other houses.

Here, too, was a beautiful lot of Malmaison Carnations in flower, and the plants are right well grown. Zonal Pelargoniums occupy a prominent position, all the very newest and best varieties being grown, and I think if you travelled all Ireland you could not beat the collection of Palms and Ferns. The plants are beautifully healthy, and seem to be exceptionally well treated. A *Musa Cavendishi* was showing a great abundance of fruit. There is also a fine house of Black Hamburg Grapes, and a house of Madresfield Court, Foster's Seedling, and Buckland Sweet-water.

In the late vinery one can see splendid Black Alicantes, Gros Colmans, and Muscat of Alexandria, all well grown. There is a bumper crop of Tomatoes, the variety being Glenhurst Favourite.

Bedding out is a large undertaking at Glenville, Begonias, Ivy-leaved Pelargoniums, Asters, Hollyhocks, &c., being very largely used.

The kitchen garden is a thoroughly up-to-date one, and one can note Sutton's Flower of Spring Cabbage. This I believe to be one of the best Cabbages in cultivation. Mr. Innes is a noted prizewinner, and has gained several distinctions at local shows. Taking Glenville all in all, it reflects the greatest possible credit on its popular proprietor and on the amiable head gardener.—J. A. P.

## Gadding and Gathering.

### The Greenhouse at Kew.

Amongst the subjects now in flower in No. 4 house in the Royal Gardens, Kew, are the following: *Hydrangea paniculata grandiflora*, *Cuphea ignea*, *Bredia hirsuta* (a pretty rose-mauve flowered Japanese Melastomaceous shrub). It is very pretty mixed with the *Cuphea*. *Capsicum nanum fulgens*, *Capsicum annuum*, *Solanum Melongena* (Egg Plant) in a number of distinctive varieties, in 8in pots, and all well fruited. *Lantanas*, in 9in pots, the plants 2ft to 2½ft through, and as high. There is a mixed selection of varieties, the chief being *A. Cleveau*, deep rose with yellow centre; *hybrida*, rich deep crimson; *Drap d'Or*, a golden variety; *Naiade*, a soft white with primrose centre; and *Boule Blanche*, another large flowered white.

Another feature is the *Begonia semperflorens* varieties; also *Statice sinuata*, *Mignonette*, *Begonia Count Zeppalin* (the pretty semi-double scarlet), *Hydrangea Hortensia*, *Campanula pyramidalis*, and *C. p. alba*; *Fuchsias*, *Coleuses*, *Humea elegans*, *Rivina humilis*, *Oranges*, *Abutilon Savitzi*, *Agapanthus umbellatus*, *Salvia mexicana* (a tall growing, graceful, new species, with deep blue flowers of moderate size), *Vinca rosea*, and others; *Crinum Powelli alba*, *Streptosolen Jamesoni*, *Achimenes* (in baskets and pots), tuberous *Begonias*, *Plumbago capensis*, *Lilium speciosum*, *Campanula isophylla Mayi*, *Clerodendron fallax*, variegated *Funkias*, *Adiantums*, *Pterises*, *Calceolaria integrifolia*, *C. Burbidgei*, *Streptocarpuses*, *Grevillea robusta*, *Pilea muscosa*, *Cyperus alternifolius*, *Browallia demissa*, *Rhodochiton volubile* (on roof), *Cannas*, *Torrenia Fournieri*, *Datura Knighti*, *Lobelia tenuior* (a beautiful subject), *Lonicera sempervirens* (on roof), *Cheronia linoides* (coming into flower), *Celosia pyramidalis*, *Zonal Pelargonium Mrs. Robert Cannell* (flowering since June), and some early flowering *Chrysanthemums*, *Mrs. A. Willis Perey's Seedling*, and *Craigmillar Park*. These include many of the subjects, though not all of them.

### Species of Hypericum at Kew.

The following is a selection of the showier sorts:—

*HYPERICUM PATULUM* has nice rounded flowers of a deep canary yellow colour. The stamens are half-an-inch long, forming a thick fringe-collar round the green ovary. It is of graceful, free growth, the leaves being glaucous beneath and dull green above.

*H. ELATUM* has starry flowers, like those of the Greater Celandine, and flowers July and early August. Its habit is dense and close, the shoots much-branched, and forming terminal clusters of chocolate-red capsules in great profusion; rather tender. Japan.

*H. CALYCEUM*, or Rose of Sharon, is known to everybody, with its dense dwarf habit and leathery dark green leaves. The large yellow flowers have long and prominent stamens. Plant in dry places. Levant.

**Kingswood Show : Best six Peaches.**

*H. MOSERIANUM* is a hybrid between the above (whose dwarf habit it follows) and *H. patulum*, its flowers being like those of the latter, but larger. It is opener and more graceful in character than the *St. John's Wort*.

*H. URALUM* (syn. *H. nepalense*) is very distinctive. The leaves are

all arranged exactly opposite on the slender, horizontal or oblique red stems, and are nearly all on one plane. It is a free-growing sort, and the washy-green foliage, suffused with a purple tint, helps to make it distinct. This year it has not flowered at Kew. Himalayas.

H. AUREUM is a dense grower, with close masses of bright golden flowers, the boss of stamens being prominent. The stems are whitish. North America.

H. PROLIFICUM bears thick clusters of small, not very showy, flowers. The leaves are 2in long and narrow. It grows very dense, and about 3ft high. North America.

H. KALMIANUM (sometimes confused with densiflorum), is an American species, is very pretty and dwarf (1½ft). Its rich yellow flowers are numerous and showy, on slender twiggy stems, the greyish leaves being thickly borne; they are linear and an inch in length. N. America.

H. ANDROSÆMUM (the Tutsan) is dwarf, 2½ft, with broad, ovate, oblong leaves, smooth and leathery. The flowers are not effective, but the clusters of nine to a dozen round crimson-red fruits are very handsome. This is very ornamental, and a good sub-shrub, found in British hedges and woodlands. The word Tutsan is a corruption from *toute saine*, the leaves formerly having been thought to heal fresh wounds. Europe.

H. DENSIFLORUM seems a straggly grower, but is showy. The twiggy growth and leaves resemble those of a Helianthemum.

H. HIRCINUM is one of the best, being free and vigorous. The dark leaves are irregular in outline, and inclined to turn under at the edges. The inflorescences practically embrace the whole length of a young shoot as much as 2ft. They are freely disposed, and the light yellow flowers are very showy. It attains a height of over 3ft. The variety minor is a dwarf compact grower, very neat and pretty, the foliage being light green. Europe.

H. HOOKERIANUM, from the Himalayas, has larger and nobler flowers than any other. These are as rich a colour as the yellow Water Lily (*Nuphar lutea*), and of the same shape—i.e., like a basin. They are stout of substance, and 1½in across. The neat, moderate sized leaves on short woody shoots assume a brilliant crimson colour towards autumn. This species is really a hardwooded shrub, and grows 6ft in height at Kew. A hybrid from this and *H. olympicum*, at Kew, is very dwarf, but has large flowers, with spreading petals.

H. PERFORATUM, the true St. John's Wort, grows 3½ft high, and if the leaves are held up to the light the perforations are noticeable. *H. oblongifolium* is a synonym of *H. Hookerianum*.

H. OLYMPICUM.—In this the flowers are from 1 to 2in across, being one of the large flowered kinds, though only reaching 1ft in height. The plant is not thoroughly hardy.—WANDERING WILLIE.

## Gladioli from Langport.

The sunless summer does not appear to have had a detracting influence on the Gladiolus, judging from the magnificent spikes sent to us by Messrs. Kelway and Son, of Langport, Somerset. Not for years have we had such fine blooms from Kelway. The flowers are of great size, plenteous in substance, rich and pure in tone, with length and breadth in their evenly disposed inflorescences. The best varieties are:

BONA, of a clear primrose colour, the segments paling towards the tips. The lip, or lower segment, is more richly coloured, and has a maroon-purple beam down the centre.

CORONATION has large white flowers, flushed with the faintest rosy mauve. The three lower segments are charmingly blotched with bright ruby purple. The spike, however, is too open down the centre.

MRS. F. FIELD is very distinctive. The flowers are practically as large as those of *Lilium Harrisii*, the broad, thick segments being gracefully curved and turned. Regarded strictly from the florist's standard, it would fall short, but as a beautiful decorative flower for the border or the boudoir it is excellent. The colour is milk white, veined and suffused with rose.

ADMIRAL MARKHAM is a rich, glowing scarlet, lined and marked towards the edges with blackish crimson. The spike is well set, and the flowers are very stout and strong.

SERAPH is one of the brightest. Its colour is rosy crimson, almost true rose toward the centre of the blossom, the deeper colour being outwardly. The middle portions of the lower segments are primrose. The flowers are large and good.

MIKE LAMBORNE.—This is the handsomest of all. The spike is perfect, and the strong, well-formed flowers are very large. In colour it is purple-crimson, with a dash of scarlet. The purple crops out in an intensified, almost violet, form, in little daubs and flakes towards the edges of the segments.

Although the Gladiolus has never attracted enthusiastic admirers to the extent of causing them to form a National Gladiolus Society, yet every lover of flowers and gardens gives reverence to these princes of the hardy plant border. In their very stateliness and magnificence may lie the reason why they have not, years ago, captivated the hearts of floriculturists.

## New Irish Industry—Pasture Seeds.

The number of industries, as a source of income, are so limited in Ireland that a new industry, or, more accurately, the revival of an old one, deserves more than passing notice. For years a number of the very poorest in this (Clonmel) and surrounding towns collected "traneen seed"—Crested Dog's-tail Grass (*Cynosurus cristatus*)—and retailed it to local agents after being threshed out, in the back streets, or on the floors of their cottages. This year large firms, such as Fennessy and Co., Waterford, employed local agents, and they advertised in "The Nationalist," with the result that not only is the collection of this seed on the farmers' pasture lands left to the poorer inhabitants of the town, but numbers of small farmers and their families collect and thresh out this seed, and retail it in Clonmel. As we write, two large railway floats, with twenty-five bags each, upwards of a ton each ear, are on their way to the station with this day's produce alone. The price to-day varies from 4s. to 4s. 2d. per stone, and we saw one small farmer's wife handed £8 for forty stone of this "traneen seed." This seed is generally cut with hooks and dried in the sun, and then threshed out. The straw makes a very fine kind of plait, but here it is the seed has value, and we understand the chief demand is from Germany. The vegetation is certain, and the bite of herbage very succulent.—W. J. M. (in "The Nationalist.")

## Insects as Garden Adornments.

The large family or group of the Noctue, also sometimes called "Owl Moths" or "Fat Bodies," contains about 300 British species, some of them being exceedingly plentiful. To gardeners this is an important group, for it contains a number of destructive insects, though not so many enemies of fruit as occur amongst other families smaller in their size, yet apt to be very mischievous.

But the caterpillars of Noctue chiefly feed upon the roots, crowns, and stems of plants, often concealing themselves in the day, even if their food is above the ground. The moths also appear after dark, with a few exceptions; during daylight they get amongst the herbage or into hedges, seldom reposing upon walls. When at rest the under wings are covered by the upper pair.

Dark or sombre colours prevail amongst these moths, though, when closely examined, some dull-looking specimens show very delicate markings, and there are instances of bright colours, which place some of them on the list of beautiful garden insects. Also we find a few species which have handsome caterpillars, but mostly these are rather rare.

The moths are furnished with a thick and strong proboscis, and, being partial to all sweets, they can be caught in hundreds by spreading upon trees and palings a syrup made of strong sugar or treacle. Entomologists do this to capture rarities, and gardeners might pursue the same plan to thin down the summer brood of such a pest as the Cabbage Moth, and consequently reduce the next season's caterpillars.

August and September are sure to show us the Silver Y Moth; not a night flier, but one that delights in the sunshine, when it passes rapidly from flower to flower with a hum. Its wings are a brilliant grey, marbled and mottled with brown, exhibiting the silvery mark, which has been compared to an English or Greek letter.

Its caterpillar occurs both in spring and autumn, feeding on a variety of garden plants. It is what is called, from its mode of walking, a half-looper; green, having six narrow white stripes; the true legs are reddish-brown. This caterpillar, like others of the genus, spins a whitish cocoon, fastened to some twig or stem.

Though not bred in gardens, as is *Plusia gamma*, its near relative, *P. Iota*, is a visitor to the flower beds, also it sometimes enters houses, attracted by some light. This species is called the Golden Y, but the mark is not so well defined. The brown wings are tinted with a rosy hue, and in the middle of a well defined bar are two spots of gold.

It flies in July or August, the caterpillar feeding on nettles, and various low plants during May. Still more metallic is the Burnished Brass, or *P. chrysis*. This, too, comes into garden precincts, attracted by the flowers. The upper wings are golden-green, having some brown blotches, the hind wings and body being grey. I have taken its caterpillar off nettles; it is attenuated, with a small shining head, apple-green, each segment has a decoration of six white marks. The rather scarce August moth is the Gold Spangle, *P. festuæ*, but it occurs all over England. Its wings are brown, but washed with gold, and having besides three very bright metallic spots of whitish yellow. Its caterpillar lives upon grasses.

Though we cannot regard the caterpillar of the Great Yellow-underwing (*Tryphæna pronuba*) with any friendly feeling, we must own that the moth developed from it is a fine insect, and one remarkable for its activity on the wing. Having gained access to a church, I have seen a specimen some summer evening occasion surprise, and even some alarm, as it careered about the building, now

Kingswood Show: The Epergnes.

taking a high flight, then a low one, settling for a moment, dashing about again amongst the people in the pews, till it suddenly vanished.

The fore wings of this moth are variable in colour and markings, but the hind pair are always orange yellow with a narrow black band. Its period of flight is June and July, the caterpillar feeding from the autumn right on to spring; we come upon it both in the flower and kitchen garden. Spring often brings it to view at the roots of early Lettuces. When alarmed it rolls into a compact ring. In colour it is brown, greenish, or grey, having a triple stripe down the back, and upon the sides some black lines; it is velvety, the head being small. It becomes a chrysalis in an oval cell under the earth.

So far as my observations go, the juvenile caterpillar frequently lives exposed to view on various plants, it has occurred upon Chrysanthemums; the approach of cold weather sends it into or near the ground, where plenty of food may be got.

We have also other Yellow Underwings, less common and quite as handsome, which turn up in gardens now and then; the caterpillars are not mischievous. The broad bordered species, *T. fimbria*, which is richly coloured on the fore wings, has the hind pair of dark orange, with a border of very deep black. During the day, about the middle of summer, this moth lurks in garden hedges occasionally, and if it is disturbed, flies out sharply, to hide again in another part of the hedge, so that it is not easy to capture. Its brown, mottled, velvety caterpillar is found upon Birch and Sallow; it hibernates, and is full-fed in May.

Of smaller dimensions is the Lesser Yellow Underwing, *T. robina*, not quite as showy in colour, yet a pretty insect, with the usual hind-wing adornment of orange and black. It is a common species, and visits flowers at sunset. The caterpillar eats low plants at first, afterwards it ascends various trees.

When we come to the moths that are familiarly known as the "Daggers," from a figure upon the wings of several species in the genus, we see there is a decided family likeness amongst the moths, but the caterpillars are sometimes very different in appearance. Two or three species have handsome caterpillars, which are not numerous enough, usually, to damage the shrubs or trees upon which they live.

Truly a universal insect is the Grey Dagger, or *Acronyeta Psi*, which has on the grey fore wings sundry mark-

ings of black very defined, and nearly white hind wings. This appears about June, the caterpillar in August and September; probably it escapes birds owing to the short black hairs and bristles scattered over the body. Though not a large caterpillar, it is a conspicuous one, having two humps, one on the fifth segment, the other above the tail, between them is a broad yellow stripe. Along the sides are bright red spots and tiny white warts, below these a grey hairy stripe. Fruit trees, Hawthorn, and Elm supply its food.

Quite a cockney species this, frequent in all London suburbs; and so is the Poplar Grey, *A. megacephala*—a Latin name presumably given because of the caterpillar's big head. It has a funny habit of reposing on a leaf with the body curved, the head, which has a black blotch on each cheek, and a V-mark at the back, is then made to touch the tenth segment.

The body is blackish, dotted with spots of red and white. Its cocoon is formed partly of chips of bark. The moth flies about our gardens and shrubberies on June evenings. Another Londoner is the Sycamore Dagger (*A. aceris*). Most years we notice one or more sitting upon the trunks of the trees, which the moth resembles in colour. Its caterpillar is very beautiful, the ground colour is grey or brownish, down this are snow-white spots, bordered by deep black, along the sides are pencils of orange or yellow hairs.

Some years ago I used to see that grand moth, the Crimson Underwing (*Catocala nupta*), taking its flight in the neighbourhood of Kensington, but by this time I expect the builders have driven it away, and many of the

Willows that furnished food to the caterpillar have been cut down. The species is not uncommon in Kent and other southern counties.

The fore wings of the moth are handsomely marbled, the hind wings have a black band upon crimson ground. It is an autumn insect, the caterpillar feeding about midsummer; it clings closely to the twigs, being long bodied and pale grey. Garden flowers or fruit have proved to be an attraction to that rare moth, the Clifden Nonpareil, or *C. Fraxini*. Single specimens are recorded in all parts of England. There is a story of a Scotsman who always carried with him a big pin in the hope of capturing one. At last the day came when he saw one upon the paling, but he had left the pin at home! However, he went and fetched it; fortunately the moth had not moved.—ENTOMOLOGIST.

Kingswood Show: Best six flower bunches.

Kingswood Show: Flower bunches, second prize.

### Inarching Vines: A Query.

I am at present trying an experiment of inarching Muscat of Alexandria Grape upon Gros Colman variety. Can anyone who has tried the same, give me information of the result?—D. C.

### Point Judging at Shrewsbury.

No doubt the details I am going to draw attention to regarding the point judging in the great Grape class at Shrewsbury will have occurred to others, and many will allow point judging still leaves something to be desired. The decision arrived at by the judges clearly shows that for cultural skill Messrs. Buchanan were leading by nine points. Taking for granted that the varieties exhibited by Mr. Goodacre were higher quality varieties, and consequently deserving higher points, yet this still deserves looking at in another light. No doubt the best Grape growers in the country were consulted regarding the framing of this class; still, they allow for the inferiority of certain varieties, and as the Messrs. Buchanan gained in seven bunches the maximum, and being in every bunch so near as only half a point off the maximum, while Mr. Goodacre only secured the maximum in one bunch, and in one case three points behind, this leaves it clear Mr. Goodacre won by quality, and not by cultural skill.

No discredit is inferred to anyone, judges or exhibitors, and I only try to show that judging by points does not give all we can desire. Cultural skill should be the first consideration. The views of others on this question would be acceptable.—W. BENBOW, Overross, Ross-on-Wye.

### Judges at Flower Shows.

I fully agree with "Judex" in his remarks on the above (page 117) in your Journal for August 6, where he says that with the exception of large shows judges' fees are not plentiful nor high enough for men to seek engagements. But good men have no need to seek engagements. This, as a secretary, I know from experience, and have found that if any committee wants to secure the best men as judges, they must fix dates of next show early and engage their men; otherwise they may be too late.

It is the men with no qualifications for judging at all who do the seeking, men who are blind to their own ignorance and overwhelmed with the ambition to appear as men of importance. These are the men, as "Judex" says, who shine better at the luncheon than at the actual judging. Of course, we know it is possible to find good practical men in high positions, who, in spite of their experience, have no adjudicating capacities at all. This being so, I think it would be doubly impossible to find a man fully qualified to adjudicate who has had no experience whatever. For a man with no practical experience at all to attempt to adjudicate at flower shows is a direct insult to the gardening profession in general, and no words too strong can be used in condemnation of the acts of such bumptious individuals, even though they may assume to be "gold medallists in horticulture." These men, through ignorance, oftentimes award prizes the wrong way about, which creates dissatisfaction amongst the exhibitors, and brings flower shows into disrepute; but I am pleased to say that during my long experience in connection with flower shows such cases seldom occur.

The rule with us is to divide the classes in the schedule into divisions, and then to appoint one or more judges for each division, being careful to select men who are experts in the growing of the things they are appointed to judge. But in the case of small shows, where the work to be done requires only one set of judges, then men with a good all-round knowledge should be selected.

I can well understand "Judex" getting on so well with his colleague, "the amiable person anxious to please everybody," for the simple reason that it would be impossible for this ignorant, but amiable person to have an opinion of his own. The latter, no doubt, is not the want of good intention, but rather the want of experience. I know of such a one who has a happy knack of quickly scanning over the exhibits, then turning round on his heels and with an air of great assurance at once says, "I

have done." He then awaits the decision of his colleague before stating what he has done; but the fact is, he has done nothing, and is simply awaiting his colleague's opinion in order that he may confirm it. At the luncheon, should they be complimented upon the soundness of the judging, "it is us"; but should any adverse comments be made by an unsuccessful exhibitor, then on the quiet he complains that it was "he, not me." After all, it is no compliment to a practical man to have his opinions confirmed by one entirely ignorant of the subject at issue.

On the other hand, it is much more than a compliment to have one's judgment endorsed by a man more practical than oneself; and as good judging contributes so much to the peace of mind of the exhibitor, and consequently to the future success of exhibitions, let us hope that this little correspondence may engender carefulness on the part of committees in the selection of judges, and that in future we shall hear no complaints as to "bogus judges or touts" having been appointed.—AN OLD HAND.

### Notes on Culinary Peas.

Notwithstanding the general untoward nature of the present year, the Pea crop is very good with us here. The two later sowings, which are now coming into blossom, have, however, the appearance of likely being of no use. They seem to have been attacked, just when about a foot in height, with a disease of some kind. The leaves have yellowed upwards from the roots, and at the present time there is only about a foot of green at the top. On examining the roots I find no signs of any insects, but they are, nevertheless, quite dead, and of a blackish appearance. I do not remember ever before coming across a similar disease, if disease it is. There is not the least symptom of mildew, and before the rows were attacked they were in the most luxuriant health.

The sorts which proved excellent croppers here this year are Gradus, for which I have not enough praise; Telephone, a splendid second early; Duke of Albany, and Gladstone. Autocrat and Sharpe's Invincible are the sorts affected as above stated, and both are good in ordinary circumstances.

I sow more of Gradus each year, for its general merits deserve it. For an early crop, worthy of the name, it is the best I have yet come across, and if regulated in sowing it is possible to give a succession far on in the season. Telephone also is a sort which does remarkably well with us here, and the same may be said of the Duke of Albany. I find an occasional dressing of lime a good thing for the Pea crop, and to get the full benefit of this we never dig the lime into the soil. We spread it on hot in spring, and allow it to work its way down, which it will soon do.—D. C., Hamilton, N.B.

### Grapes at Bath Show.

Mr. W. Taylor, formerly of Longleat, and more recently manager and grower for Alderman Chaffin, of Bath, has, on the occasion of the recent Bath Show demonstrated once again his unique, and, indeed, his marvellous capacity as a Grape culturist. Not only did he defeat that now famous West-country grower, Mr. Mitchell, in the principal class for Grapes (eight bunches), but in two other classes he took the lead with superb examples. The house in which they are cultivated covers but a small area (something like 26ft by 15ft if my memory serves me correctly), and when it is remembered that this small structure has been subjected to the requirements of the market grower's heavy crops for some years, it is nothing less than remarkable that in so short a space of time Grapes of the highest state of perfection have been produced. Mr. Taylor's name and fame became well established during the periods spent at Longleat, and later at Bath, and the authorship of "Vines at Longleat" helped not only to make his name familiar, but showed also the clear grasp he possessed of the most minute detail and requirement of the Grape Vine.

It is a well-known fact that Grape culture has been Mr. Taylor's great life study, and there are not a few gardeners and amateurs, particularly among Journal readers, who have benefited from advice which he so unselfishly has given from time to time. I am quite sure there are many readers who will freely acknowledge with admiring pride his latest triumph. Muscat of Alexandria, between 4lb and 5lb in weight, dense of bloom, and bright in colour, figured strongly in his exhibits. Madresfield Court, Gros Maroc, and Black Alicante were each severally shown in beautiful condition, the bloom dense, and the colour deep. There are but five Vines in the house, the oldest being about ten years planted; others have been introduced without any reconstruction of border, and their response within the past two seasons to this clever grower's methods is nothing less than phenomenal, and Mr. Marsh, the owner of the Vines, is not less proud than is their grower satisfied, with the progress made.—W. S.

## NOTES

## NOTICES

**Royal Caledonian Horticultural Society's Show.**

The secretary of the above asks us to say that the autumn exhibition held by this society takes place in Edinburgh (Waverley Market) on September 9. He adds: "I find some people inquiring where the Royal Caledonian Horticultural Society holds its autumn show" (!).

**A Record Price for Kent Grown Potatoes.**

Messrs. Horne and Sons, Cliffe, Rochester, have sold to a speculating buyer two tons of Northern Star for £317. The said buyer has refused £400 for them. This Potato is turning out all that is claimed for it, strong grower, abundant cropper, good quality, and free from disease. It is expected Northern Star will make £400 a ton before Christmas. There are plenty of buyers, but few sellers.

**Kentish Flower Shows.**

Strange though it may seem, the fair gardening county of Kent cannot boast of a single great flower show. Though it enjoys a favourable climate, is famous for its fruit, and is studded with pretentious garden establishments, no horticultural exhibition is held within the borders of the Hop county that can compare in size and excellence with those which annually take place at Hanley, York, Shrewsbury, Edinburgh, and elsewhere. Close proximity to the metropolis may, perhaps, account for this. Though attempts have been made to establish good shows in various towns, they have invariably ended in financial failure.

**Gardening Appointments.**

Mr. Richard Roberts, as head gardener at Mannan, Dolgelley.  
\* \* Mr. Benbow, gardener to the Earl of Ilchester at Abbotsbury Castle Gardens, Abbotsbury, has been appointed gardener to Sir Thomas Hanbury, of La Mortola, Ventimiglia, Italy. Mr. Benbow has had experience of horticulture in the Riviera, as he was gardener for a time at Cannes, and also at the Chateau de Barla, Nice. It was this experience which qualified him for taking the position at Abbotsbury, where there is so fine a collection of sub-tropical trees, plants, and flowers. Here Eucalyptus coccifera and E. globulus have been raised from home-grown seed, the seedlings now being ten feet high. The Olive, *Olea europæa*, is established; *O. excelsa* also raised from seed. Seedling Bamboos are two feet in height. *Acacia dealbata*, raised eight years ago, are now trees flowering every year. The flowering branches are cut for decorative purposes as early as February; and *Arundinaria Simoni*, as at many places in the country, is flowering.

**Mr. W. B. Latham.**

A meeting of nurserymen, gardeners, and others interested in horticulture was held at the Oddfellows' Rooms, Temple Street, Birmingham, on Saturday, August 22nd, to consider the best means of recognising the many years of valuable service rendered to horticulture by Mr. W. B. Latham, who is resigning the curatorship of the Botanical Gardens, Edgbaston. At that meeting it was unanimously resolved to entertain him at a complimentary dinner, to be held at the Colonnade Hotel, New Street, Birmingham, on Thursday evening, September 24, and in the meantime to raise a fund for the purpose of presenting him with a testimonial suitable to the occasion, and such that will represent the good wishes of all lovers of horticulture in Birmingham and district. In addition to having held the curatorship for thirty-five years, he has been chairman of the Birmingham Chrysanthemum Society thirty years, the Gardeners' Association seventeen years, and the Birmingham spring flower show fifteen years, thus establishing a unique record of useful activity in the interest of horticulture. A general meeting of subscribers will be held at the Athletic Institute, John Bright Street, Birmingham, on Monday evening, September 14, at eight o'clock, to consider and decide upon the form of testimonial to be presented.—J. HUGHES, Hon. Secretary, 140, High Street, Harborne, Birmingham.

**A Correction.**

In the letter on the Manetti stock, from "Herefordshire Incumbent," page 194, an error occurred. Instead of "Cairo," in line 28, third paragraph, it should have read "Como."—ED.

**The Gardeners' Dinner.**

We are asked by Mr. A. Dean, hon. secretary of the Gardeners' Dinner Committee, to state that there is an impression abroad that young gardeners are not expected or invited to join in the party, and this notion should be abandoned. Under gardeners, as well as their chiefs, are heartily welcomed. Mr. Dean's address is 62, Richmond Road, Kingston.

**"Beautiful and Rare Trees and Plants."**

Messrs. George Newnes, Ltd., announce that they have in preparation for publication the above work by the Earl Annesley. There will be about seventy plates, reproductions of original photographs. The edition will be limited to three hundred copies, and subscribers will be supplied in the order of application. Specimen pages can be had on application.

**British Rainfall Organisation.**

The British Rainfall Organisation, founded in 1860 by the late G. J. Symons, will henceforth be carried on under the sole charge of Dr. H. R. Mill, as Mr. Sowerby Wallis has been compelled by ill health to retire after more than thirty years' connection with the association.—W. SOWERBY WALLIS, HUGH ROBERT MILL, 62, Camden Square, London, N.W.

**A Case Deserving Help.**

Will you permit me through your columns to solicit the support and interest of anyone who has any influence with the governors of the Royal Hospital for Incurables, Putney, on behalf of Mr. James R. Grant, a paralysed gardener, residing at Addlestone, Surrey, for the pension? This case is strongly recommended by Mr. H. Veitch, Mr. Ingram, also by Dr. Wilson, of Weybridge, and Captain G. A. Webbe. I hope to be again able to organise a concert on behalf of the Gardeners' Benevolent Institution, and would be glad of the help of anyone living within reasonable distance of Chertsey. The concert will be early in November.—A. J. BROWN, The Gardens, School of Handicrafts, Chertsey.

**The London Dahlia Union.**

Owing to the closing of the Royal Aquarium, Westminster, the annual grand display of Dahlias made by the Union—which comprises all the leading Dahlia raisers and cultivators of the day—will take place in the Prince's Hall of the Earl's Court Exhibition, which is near the entrance in the Warwick Road, on Wednesday and Thursday, September 16 and 17. It is during this particular week that the popular Cactus Dahlia is seen at its best, and on this occasion there will be on view not only all the finest new varieties of the present year, but several from abroad, including some very singular and interesting variations of the type of home and foreign production. As the Dahlia show will form part of the general exhibition, it is free to all who pass the gates, and the flower-loving public will have an opportunity of witnessing one of the largest exhibitions of all types of the Dahlia ever seen in London. The secretary and manager is Mr. Richard Dean, V.M.H., Ealing, London, W.

**The Late William Housley.**

The numerous friends of Mr. William Housley, F.R.H.S., of 28, Joshua Road, Sheffield, heard with regret of his death, which took place some days ago. Mr. Housley, who was in his fiftieth year, had been on the staff of the Sheffield General Post Office for the last thirty-two years. He was a highly respected official, being especially popular with the men under his supervision. Possessing a wide circle of friends, he was well known in the city. Apart from his official duties, Mr. Housley cultivated a taste for flowers, and was secretary of the Sheffield Chrysanthemum Society for a period of fourteen years. The success of the many shows held at the Corn Exchange and the Cutlers' Hall was in a great measure due to his energies and capable management. His successor in this post, pro tem, is Mr. M. H. Willford, of 96, Greenhow Street, Walkley, Sheffield. The interment took place in Norton Cemetery, there being a large number of mourners—late friends in various connections of his business; and the floral tributes were numerous and beautiful.

## Societies.

### Royal Horticultural, September 1st.

Save for some Orchids and fruit, the exhibition of the Royal Horticultural Society was submerged, and the hall was given over to Dahlias. Messrs. Williams and Son and Charlesworth and Co. had Orchid groups, while a small collection of fruit came from Lady Plowden (gardener, Mr. Clarke), Aston Rowant House, Oxon. The Peaches, Nectarines, Gages, and Lemons were exceedingly fine.

A cultural commendation was awarded to Mr. Howe, gardener to Lady Tate, of Park Hill, Streatham Common, for twenty-eight Brown Turkey Figs (second crop).

Messrs. W. Wells and Co., Ltd., Redhill, displayed a small but interesting exhibit of early flowering Chrysanthemums, which included nice clusters of Carrie, Blush Beauty, Goacher's Crimson, Gertie, The Champion (a fine yellow), Champ de Neige, Pearl, and Polly. The blooms were mostly exhibited in both forms, naturally and disbudded, thus enabling the public to form a fair estimate of their merits.

From Messrs. Jas. Veitch and Sons, Ltd., came a most interesting exhibit of Vitis (species from Central China), which were represented by V. armata, V. Romaneti, V. Aconitifolia, V. flexuosa Wilsoni, V. megaphylla, and V. Thomsoni; also a fine basket of Buddleia variabilis var. Veitchiana and a nice basket of Lilium auratum var. Tashiori.

Hobbies, Ltd., staged some cross-bred Fuchsias, H. Henkell (triphylla x corymbosa), &c.; also Iris pallida fol. var. And various small exhibits were set up by others for certificates.

#### Certificates and Awards of Merit.

*Tamarix hispida aestivalis* (R. Veitch and Son, Exeter).—This is seemingly an upright growing kind, with mauve-purple inflorescences, heavier than in the type. A.M.

*Chrysanthemum maximum King Edward* (W. Angus, Penicuik, N.B.).—A large flowered form, 6in across, very pure white. A.M.

*Cattleya x Pittiana Wilson-Potter's var.* (J. Wilson-Potter, Esq.).—Parents: C. aurea x C. granulosa Schofieldiana. The wavy petals are tawny brown, with reddish flush. The lip broadens in front, and is rich mauve-purple. F.C.C.

*Hidalgoa Wercklei* (No name).—This "Climbing Dahlia" is now well-known, and was figured by us in 1901. It has orange-scarlet flowers, but does not blossom freely. It is a rampant, sappy grower, and requires a greenhouse. A.M.

*Chrysanthemum The Champion* (Wells and Co.).—This is a very early-flowering, open-air, market variety, rich deep canary yellow, with plenteous clusters. A.M.

### National Dahlia, September 1st and 2nd.

The exhibition held by the Dahlia Society was good on the whole, and the whole of the James Street Drill Hall at Westminster was filled. A number of varieties were certificated, but it is doubtful if more than three or four were worthy of the distinction.

The staging of the flowers in very many of the amateurs' classes was remarkable for its slovenliness, and Dahlia growers do not seem to possess much artistic capability. If Mr. Tulloch's example were followed, the standard of excellence in appearance would be raised one hundredfold. Nevertheless, next year and the year after we shall most likely have the same complaint to make. And why should this continue?

#### Nurserymen.

The premier class for Show and Fancy Dahlias was for forty-eight distinct varieties. As a rule this class is keenly contested, and on this occasion there were three exhibitors. The general quality of the exhibits was well up to the average, the blue ribbon going to Messrs. Keynes, Williams and Co., of Salisbury. The varieties were—back row: Henry Walton, Royal Queen, Buttercup, Norma, George Sangers, Peacock, Duchess of Albany, Emin Pasha, Gaiety, J. T. West, S. Mortimer, Rev. J. B. M. Camm, Wm. Rawlings, Chieftain, Lauretta, Purvis, and W. Glasscock. Second row: Mrs. Every, Gold Medal, Gloire de Lyon, Henry Clark, J. M. Keynes, Goldsmith, Arthur Rawlings, Duchess of York, Mr. Chamberlain, Harry Keith, John Hickling, J. Cocker, Gracchus, R. T. Rawlings, Mrs. Langtry, Florence Tranter, Wm. Keith, Watchman, David Johnston, Warrior, Mrs. McKenzie, John Walker, Henrietta, Rebecca, Mrs. Saunders, Matt. Campbell, R. Deau, Dr. Keynes, Virginale, T. Hobbs, Dorothy, and H. Bond.

Mr. Charles Turner, Slough, was a capital second, his best flowers being Mr. C. Noyes, W. Garrett, Glowworm, Colonist, Mrs. Morgan, Maud Fellowes, Dorothy, Gracchus, Mrs. Gladstone, John Walker, W. Keith, and Arthur Rawlings. Mr. S. Mortimer was a good third. A few of his best flowers were Mrs. Gladstone, Mrs. Mortimer, Harrison Weir, Crimson Globe, and Earl of Ravenswood.

For thirty-six distinct blooms there were four entries, the

first position being awarded to Mr. W. Treseder, Cardiff, for a nice level exhibit, but the exhibitor could not be congratulated on his method of labelling. The varieties were; John Walker, Henry Walton, Colonist, Comedian (self), T. J. Saltmarsh, Comedian, John Hickling, Goldsmith, Major Bartelot, Duchess of York, Prince Bismarek, Prince Henry, Mrs. Saunders, T. S. Ware, Mrs. G. R. Jeffard, Eclipse, Arthur Ocock, Mrs. Langtry, W. Garratt, Marjorie, Purple Prince, Virginale, Duchess of Albany, Arthur Rawlings, Matt. Campbell, Mrs. Dodds, Sunset, Mrs. D. Saunders, Goldfinder, Shottesham Hero, Diadem, Mrs. W. Slack, Duke of Fife, Chieftain, Prince of Denmark, and Mrs. Gladstone.

Mr. S. Mortimer was second with good blooms of Virginale, Duchess of Albany, Grand Sultan, Jas. Cocker, R. T. Rawlings, Dazzler, and John Walker; while Mr. J. Walker, Thame, brought up the rear in good style.

In division B, twenty-four blooms distinct were asked for, and three exhibitors responded, Mrs. M. V. Seale, Vine Nurseries, Sevenoaks, winning first prize. Messrs. J. Cray and Sons, Frome, were a neat second; Mr. G. Humphreys, Chippenham, third.

The smaller class for eighteen blooms brought out three entrants, Mr. Geo. Humphries leading. The competition, however, was keen between the first and second places. Messrs. J. Cray and Sons, Frome, were second with R. T. Rawlings, Mrs. Saunders, Mrs. F. Forman, Colonist, and T. S. Ware as their best flowers. Mrs. M. V. Seale third.

In the twelve distinct varieties (division C) there were only two entries. Here Mr. J. R. Tranter, Henley-on-Thames, proved the victor, and Messrs. J. Cheal and Sons, Crawley, were a capital second.

**CACTUS DAHLIAS.**—Additional interest was added to the large class for Cactus Dahlias (eighteen varieties in bunches of six blooms each) by the Challenge Cup, now offered for the first time. Needless to say, the competition was keen, and the cream of varieties were on view. There were four competitors who made a brave show, but Messrs. Jas. Stredwick and Sons, St. Leonards, were placed first, having a stand rich in lilacs and pinks. The varieties were: Reliance, Diadem, Magnificent, Oliver Twist, Falcon, Osprey, Mrs. J. W. Wilkinson, Mrs. Winstanley, Amelia Roberts, Rainbow, Ivanhoe, Columbia, Sirius, Pearl, Merlin, Comet, Florence M. Stredwick, and Ella Kraemar. Messrs. J. Burrell and Co., Cambridge, must have run the first prizewinner very hard, for there was little to choose between them. In this exhibit the blooms were all of the refined type, a few of the best being W. J. Gallon, Premier, Albion, Violette, Conrad, Romance, J. H. Jackson, Ianthe, and Ella. Messrs. J. Cheal and Sons were an excellent third.

A class for twelve varieties of six blooms each brought out a strong force of four exhibits. Mr. J. Walker proved the victor with a strong set. The varieties were: Phineas, Mrs. Ed. Mawley, R. Dean, Ianthe, Mrs. H. J. Jones, J. Weir Fife, Lord Roberts, Raymond Parks, Crimson Gem, Eva, Unele Tom, and Alpha. Mr. S. Mortimer was second with a well staged exhibit, the best bunches being Winsome, Mrs. W. Cuthbertson, Gabriel, Eva, Mrs. Carter Page, and Lyric. Mr. C. Turner was third.

For forty-eight blooms (class 8) arranged in the orthodox fashion on boards, there were four competitors. Here Messrs. J. Burrell and Co. were placed first, the varieties employed being nearly all seedlings raised at Cambridge. They were Trojan, Albatross, J. H. Jackson, Ianthe, Premier, J. Harrison, Albion, J. W. Wilkinson, Mrs. E. Mawley, Conrad, Fairy, Ajax, Maurice, Phineas, W. J. Gallow, Romance, Ella, Zoe, Ambrosia, Britannia, Decima, Sylvia, Rupert, Amabel, Minnie West, Chameleon, Gilbert, Enchantress, Timona, Mrs. de Lucca, Epopee, Ida, Olga, Lyric, Gazelle, Alicia, Cerasus, Vesta, Florence H. F. Robertson, Galliard, Rosine, Lauretta, Raymond, Blanche, Curio, and Dulcis. Messrs. Keynes, Williams, and Co. were second, having good typical blooms; while Messrs. J. Stredwick and Son were third with blooms undeveloped, or they would have pointed higher.

A smaller class for twenty-four blooms allowed the smaller exhibitors a chance of competing, and they responded well with eight entries. Mr. W. Baxter, Woking, secured the first prize; Mr. Mortimer was second; and Mr. W. Treseder brought up the rear.

Class 10 was for a decorative exhibit, with twelve varieties, six blooms each, arranged in vases with any suitable foliage, grasses, or berries. The stems could be stiffened by wires. The quality of the flowers being the leading feature. Here there were three exhibitors, Messrs. J. Cheal and Sons scoring with an exhibit arranged with grasses, Prunus Pissardi, and a few berries. Mr. M. V. Seale came second, using foliage liberally, in fact, too liberally; while Messrs. Keynes, Williams and Co. were a good third.

**POMPON DAHLIAS.**—The largest class for pompons was that for twenty-four varieties of ten blooms each, and was represented by three exhibitors. The first prize was awarded to Mr. Chas. Turner for a perfect display, the colours being well balanced, and the individual bunches all that could be desired. The varie-

ties were Bacchus, Orpheus, Silvia, Distinction, Sunny Daybreak, Lorama, Daisy, Snowflake, Queen of Whites, Douglas, Hesperia, Ganymede, Nellie Broomhead, Emily Hopper, Cyril, Romulus, Darkest of All, Nerissa, Adelaide, Mignon, Hypatia, Malcolm, San Toy, and Jessica. Messrs. J. Cheal and Sons were second with nice bunches of Madeleine, Mephisto, Little Bugler, Iona, Commodore, and Cyril; while the third place was taken by Mrs. M. V. Seale with a bright exhibit.

Seale, Miss Roberts, Ferito, Madge, Formosa, Beauty's Eye, Naomi Tighe, Miss Morland, Victoria, Eric, Robin Adair, Columbine, Royal Sovereign, Polly Eccles, Snowdrop, and Wm. Parrott. Mrs. M. V. Seale was a good second.

For twelve bunches of ten blooms each there were three exhibitors, Mr. J. Walker being awarded first prize for a well displayed exhibit. Messrs. J. Cray and Sons were second, and Mr. Geo. Humphreys third.

**A Floral Arrangement.** (See page 214.)

A class was provided for twelve bunches, with a similar number of flowers. Here there were three entries, Messrs. J. Cray and Sons, Frome, being first; Mr. J. Walker second; and Mr. Geo. Humphreys third.

**SINGLE DAHLIAS.**—The single section was represented by two classes, the premier for twenty-four varieties of ten blooms each brought two exhibits. Messrs. Jas. Cheal and Sons were placed first with a model display, though without a bunch of a pure white. The varieties employed were Amos Perry, Tommy, Vesuvius, Hilda, Meta, Demon, Aurora, Miss Girdlestone, Leslie

#### **Amateurs.**

**CLASS 15.**—The Silver Challenge Cup for two dozen Show and Fancy Dahlias (or intermixed) was captured by Mr. Thos. Anstiss, of Brill, Bucks, with flowers of very moderate size, but as perfect in form and purity as could possibly be; all were good, and comprised William Powell, Daniel Cornish, Jno. Walker, Sarah Mortimer, Duchess of Albany, D. Johnson, Chieftain, Mrs. W. Slack, Mrs. D. Saunders, Florrie Tranter, Mrs. J. Forman, J. T. West, W. Rawlings, Marjorie, Purple Prince, R. T. Rawlings, Mrs. Langtry, Mrs. Gladstone, T. Anstiss, Dr. Keynes, and

Hercules. Mr. J. Pilling, Gibraltar Cross, Gee House, Hyde, came second with a poorly staged set, and very uneven; third, Mr. W. Peters, Holmhurst Lodge, St. Leonards.

For the eighteen ditto, Mr. A. Parkes, of Ightham Mote, Ivy Hatch, Sevenoaks, led the way, having some good Fancies, and altogether a fair selection of fine flowers. Mr. S. Cooper, The Hamlet, Chippenham, Wilts, must have been a close follower; and third, Mr. E. T. Matthews, 42, Almond Street, Derby.

**SHOW DAHLIAS ONLY.**—Mr. J. Newman, Bell Inn, Kingswood, Bristol, beat J. Cousins, May Cottage, Greenway Lane, Chippenham, only the two showing, and each being good for the twelve blooms. For the six of this section, the winners were Mr. Geo. Hood, Langley Buwell, Chippenham, with excellent flowers; second, Mr. F. Grinstead, Beaufort Park, Battle, also with fine blooms; and third, Mr. J. Britton, Hackney Training Schools, Brentwood.

**FANCY VARIETIES.**—For the twelve, we found Mr. S. Cooper again in the forefront, winning the special prize presented by the Duchess of Sutherland. Second came Mr. Thos. Anstiss, with a weak set; and the third was disqualified owing to his having some Show varieties. For six Fancies, Mr. J. Newman led against Mr. J. Cousins; and third, Mr. A. Parkes, each with grand samples.

**CACTUS DAHLIAS.**—In class 21, for the six varieties, six flowers of each, a very handsome display was made by Mr. E. Turner, of The Vicarage, Hippington, Sevenoaks, yet there was room for still more effect. This seemed to be the only entry, yet the class might have been one of the most interesting in the show.

The Silver Challenge Cup, for nine varieties, in bunches of three, brought forward six competitors, and Mr. Percy Tulloch, of Sterndale, New Church Road, Hove, romped in first. It is remarkable that year after year we find such slovenly setting up of flowers. Mr. Tulloch was exemplary in this respect, as he always is, but his opponents here were simply disgraceful, some of them showing in vases with the labels of the Carnation Society still pasted to them! Come, let us advance. Mr. W. Peters was second, and Mr. Quinland, of East Grinstead, third.

The class for six varieties, in trebles, enticed eight entries, some of them very good. Mr. H. Brown, of North Street, Luton, had a very smart exhibit for first, having amongst others, Up-to-Date (a graceful rose-carmine). Mr. Grinstead was second, and Mr. E. Mawley, the President, third. Mr. Mawley might have staged his more tastefully; a little moss beneath would have helped. Messrs. Keynes, Williams and Co., and Cheal and Sons, gave the second and third prizes.

For Messrs. Dobbie and Co.'s gold badge, and Cheal and Sons' money award, Mr. H. A. Needs, of Heath View, Horsell, made the best show, and thus led. He staged fine, sweet, graceful flowers, all even and good, above a showy black stand. The names were printed and fixed with elastic—neat and convenient. His best were Mrs. Carter Page, Mabel Tulloch, Mrs. E. Mawley, and Floradora. Mr. J. Bryant, of St. Martin's, Salisbury, was second, and Mr. J. Shoebridge, St. Margaret's, East Grinstead, came next, out of seven. Mr. Mortimer gave the prizes.

Mr. H. Brown was first for the twelve; E. T. Matthews second; and G. Quinland third. For the six do. (Cheal's prizes), the lead was with Mr. N. Lockyer, of Greenhill Park, New Barnet; second and third being A. Brown, of Luton; and A. Parkes, of Sevenoaks.

**POMPON DAHLIAS.**—These made a fair show. For the twelve in bunches of six, Mr. H. Brown had a grand lot, and was first; Mr. J. F. Hudson, of Acton, came second; Mr. W. C. Pagram, The Whin Gardens, Weybridge, third. For six ditto, Mr. A. Brown was foremost, being followed by F. Gazeley, North Street, Luton; and third, Mr. J. Britton, Brentwood.

**SINGLE DAHLIAS.**—For six bunches of ten flowers each, Mr. J. F. Hudson was placed first; Mr. Mawley, with a well-staged lot, came next; and third, Mr. W. Peters. For six varieties, six of each, the Rev. S. Spencer Pearce, of Combe Vicarage, Woodstock, Oxon, was the only exhibitor. For the dozen sorts, arranged in vases for effect with foliage, only two entrants were brave or artistic enough to come forward. The first prize was well won by Mr. J. F. Hudson, who used *Kochia scoparia* shoots, Maple twigs, *Ampelopsis*, *Adiantums*, and *Asparagus plumosus*. The colour contrasts were excellent, and as glasses were used, the effect was light and graceful. Mr. Mawley was second. This class should be very greatly developed; this is using the flower, as well as exhibiting it.

**DECORATIVE CLASSES.**—The baskets of Dahlia blooms arranged with appropriate foliage were not particularly striking. The first prize fell to Mr. H. A. Needs, who used yellow and bronze flowers, with *Prunus pissardi* and *Asparagus*. Mr. R. Edwards, Beachy Lees, Sevenoaks, was second, and Mr. A. Parkes, third.

There were six competitors for a vase of Dahlias, Mr. H. A. Needs being first; Mr. P. Tulloch second, Mr. F. G. Oliver third.

For three vases of Cactus Dahlias, six blooms in each, with suitable foliage, no less than five entries were staged. Mr. P. Tulloch was first with five vases of Lucifer, Mrs. Ed. Mawley, and Mrs. Carter Page. Mr. Ed. Mawley made a good second, and Mr. R. Edwards third.

Classes 35, 36, and 37 were staged by novices. For six Show or Fancy Dahlias there were six entries. Mr. John Newman, Bell Inn, Kingswood, Bristol, winning first prize. Mr. Geo. Hood, Langley Burrell, Chippenham, followed with four good flowers, while Mr. E. F. Matthews was third.

For six Cactus varieties Mr. F. Grinstead, of Battle, led; Mr. J. Button, Brentwood, second; and Mr. F. Gazeley, Luton, third.

#### Open Classes.

THE OPEN DECORATIVE CLASSES were not quite so strong as usual as far as entries were concerned, though the quality was well maintained. For a shower bouquet there were three entries, Mr. W. Treseder winning easily with an arrangement of white and bi-coloured flowers. Mrs. M. V. Seale being second with a bouquet of yellow and bronze, while the third place fell to "Rimberley," Kenilworth, for a heavy affair.

The decorative baskets only brought out three exhibits, Mrs. M. V. Seale winning with a display arranged with berries and foliage. The blooms consisted of such varieties as Richard Dean, Floradora, and so on. Mr. W. Treseder came a good second, using bi-coloured flowers most effectively.

The competition for a vase of pompon varieties (class 40), arranged with appropriate foliage brought out six entries. Mr. W. C. Pagram, The Whin Gardens, Weybridge, winning handsomely; Mrs. M. V. Seale being placed second, and "Rimberleys" third.

The class for six bunches of Fancy single Dahlias, six blooms to make a bunch, brought out four exhibits. The first prize was won by Mr. J. H. Hudson, Acton, who staged a charming exhibit, the varieties employed being Tommy, Victoria, Dearest, Madge, Louise, and Girlie. Mr. J. Walker came next, and Mrs. M. V. Seale brought up the rear.

#### Seedlings.—The following Dahlias received F.C.C.'s.

*Princess of Wales* (J. Cheal and Sons).—A single variety, rosy lilac with an orange disc.

*Mrs. J. W. Wilkinson* (Messrs. J. Stredwick and Son).—A true Cactus, deep rosy pink, excellent in form.

*Florence M. Stredwick* (Stredwick).—A good white Cactus that fails at the base of the florets.

*Pearl* (Stredwick).—A grand Cactus variety, rosy pink, with a silvery tip to each petal; quite the best novelty exhibited.

*Mrs. H. L. Brousson* (Stredwick).—A true Cactus, with refined petals, buff in colour, evidently a seedling from Magnificent.

*Sirius*.—A Fancy Cactus, coloured crimson, overlying gold. (Stredwick).

*H. W. Sillem*.—A good heavy exhibition flower, but hangs its head too much; rich crimson, with refined petals. (H. Shoesmith, Woking).

*Pompon Queen of the Whites* (Chas. Turner).—White, a good form.

*Pompon Edina*.—A pretty rich yellow, with reddish centre.

#### Non-competitive Exhibits.

Hobbies, Ltd., Dereham, as one would expect, were largely and well represented. We name a few of their best. *Ida*, *Minnie West*, *Yellow Gem*, H. J. Jones, and H. F. Robertson, each shades of yellow; Mrs. Amos Perry, *Ella*, *Ibis*, *Shamrock*, and *Raymond Parks*, as crimson and allied shades; *Alpha* (a Fancy), *Mabel Tulloch*, rosy; *Lord Roberts*, milk-white; Mrs. Seagrave, ruby crimson-purple; also *Dainty*, *Etna*, and *Winsome*.

Messrs. T. S. Ware (1902), Ltd., from Feltham, had their blooms arranged in flat, even lines. *Sandpiper* is very brilliant; *Winsome*, a good white; *Ida*, yellow; *Loogali*, a rich golden crimson; J. W. Wilkinson, as good as ever; also *Galliard* and *Baden Powell*. Capt. Broad must be a grand decorative garden variety, intenser and richer than the old Show, *Glare of the Garden*. We should like to see a mass of this.

Messrs. Cutbush and Son, Barnet, Herts, had a tasty group and well set up. The older favourites, as well as the novelties, were here. We believe Messrs. Cutbush grow as many as 10,000 annually for the supply of their customers, and they are likely to come right to the front in this department.

Messrs. H. Cannell and Sons, Swanley, contributed a large and varied display of Dahlias, arranged in sprays, with breaks of the beautiful foliage plant *Kochia scoparia*; while the common *Bracken* and *Gypsophila* were used effectively. The Cactus varieties constituted the leading feature, and the most noteworthy varieties were Mrs. F. A. Perkins, Mrs. Winstanley, Progenitor, Mrs. Carter Page, Mr. Amos Perry, *Gabriel*, *Florence*, R. J. Hamill, *Columbia*, and J. W. Wilkinson. The firm also displayed *President Viger* and a few Continental monstrosities such as *Le Colosse*, *Souvenir de Gustave Douzon*, and *Madame Van den Dael*.

#### Bath Floral Fête, August 26th and 27th.

The promoters of this fine and popular autumn show congratulated themselves on the choice of a fine morning for the opening of their exhibition, but the elements dealt, as they so often do at Bath, a severe and damaging reverse just at a critical moment. The second day, too, proved disastrously wet in the afternoon, so that the gate receipts for the two days must have been lamentably short of their average.

The show itself was of all-round excellence; in some instances

it was surprisingly good. Roses, herbaceous flowers, fruit, Fuchsias, and table decorations in particular. The class which provided for twelve ornamental and flowering plants found Messrs. Cypher and Sons, as usual, easy winners, though we have seen finer plants on some previous occasions from the Cheltenham Nurseries. *Codiaeum angustifolia*, *C. Thompsoni*, Countess, Evansianus, and Gloriosa, the latter a pale lemon yellow-leaved kind, were very good, though of smaller size in plant to what is usually staged by Messrs. Cypher. Palms were fine, so also were the flowering plants, and *Bougainvillea glabra* in particular. Mr. G. Hallet, Bath, was second with much smaller specimens.

Messrs. Cypher won with single specimens of flowering and foliage; and with six ornamental foliage Messrs. Cole and Son were a good first. Groups are always a notable feature of the Bath shows. Messrs. Cypher, on this occasion, maintained their position with a beautiful exhibit arranged in their well-known style. Messrs. Cole and Son were defeated by Mr. R. B. Cater's clever gardener for second prize, with a most commendable arrangement, though the discriminating tax imposed on the judges must have been a severe one, so uniform were individual merit, both in style of arrangement and quality of plant.

Fuchsias, despite the trying season, were in beautiful condition, so free of flower, rich in variety, and perfectly modelled. Perfect pyramids, from eight to ten feet in height, clothed from their points to the pots with healthy foliage and flower, were staged in goodly numbers. With nine specimens, Mr. Parratt, gardener to H. W. Tugwell, Esq., Bath, won with such varieties as Clipper, Tucker's Rival, Western Beauty, Final, Masterpiece, Doel's Favourite, and Jubilee Queen. Mr. Chislett, gardener to E. T. D. Foxcroft, Esq., Hinton Charterhouse, was an exceedingly close second, Mrs. Bright, Arabella, Amy Lye, and Brilliant being some of the most striking varieties shown. Mr. H. Pocock, Hilpertion, staged the best six with unnamed plants, Messrs. G. Tucker and J. H. Willcox following. Messrs. Parrot and Chislett won respectively with dark and light-coloured single specimens.

With six stove or greenhouse plants in bloom, Mr. Tucker staged well-trained, freely-bloomed plants of *Ixora Fraseri*, *Dipladenia Brearleyana*, *Bougainvillea Cypheri*, *Allamanda nobilis*, and *Statice Gilberti*. In Mr. Chislett's second prize lot occurred a beautiful *Clerodendron Balfouri*. Messrs. Cypher won with *Ixora Duffi* as a single specimen; Mr. Tucker with *Stephanotis*, was a good second. Messrs. Stokes and Son led with twelve Ferns, and Mr. G. Tucker staged a beautiful half-dozen, the same growers winning also with single specimen Ferns. Geraniums, Gloxinias, Coxcombs, Petunias, Orchids in six varieties, Coleus, Begonias, were all capitally represented.

Cut flowers in their many kinds, taking the weather into account, were really marvellous. Roses were superb in colour and size. Messrs. Perkins and Son, Coventry, and Mr. John Mattock, had the best twenty-four singles; Mr. Crossling, Cardiff, the best twelve; and in the class for twelve varieties shown, five in each vase, their exhibit was simply perfect. Messrs. Perkins' exhibit lost much by the indifferent style of staging. Mr. J. Mattock was a good third. Mr. Alex. Hill Gray, Bath, had the best Teas; Dahlias were very good; Pompons, Cactus, singles, Show and Fancy, were all splendid. The Cactus, single, and Pompon, however, far excel as an exhibition flower. Messrs. Cray were again successful. Mr. Tickle, gardener to T. Carr, Esq., Twerton, excelled with singles, beautiful in flower, colour, and arrangement. Messrs. W. D. Porter, Bath, and R. B. Cater's Zonal Pelargoniums in twenty-four bunches, made a most interesting and bright display, individual trusses and pips being so good. Asters were fine and numerous, Zinnias and Marigolds bright, as also were annuals, cut Gloxinias, and stove and greenhouse flowers.

Hardy perennials created the greatest interest, a great bank of varied colours, many feet in length, was the admiration of everyone. Messrs. Stokes and Son excelled more by variety than by individual quality, though all were high-class and some were both rare and choice. Messrs. W. D. Porter and Walters and Son were equally deserving competitors.

Decorated dinner-tables brought together no less than ten rivals, out of whom but three won a prize. Mrs. Waller, Westbury-on-Trym, had a delightful blend of soft coloured Orchids and other flowers; Mrs. Colston Hale, with bronze and pale Orchids, secured second; and Mrs. G. F. Butcher third. Mrs. Hale, for a beautifully-dressed vase, was first in that class, and second for a vase of wild flowers.

The fruit tent was unusually well filled, Grapes and Apples in particular being both numerous and of fine quality. A class for eight bunches found Mr. W. Taylor, grower to Mr. Marsh, Bath, a good winner, his Muscats being the finest coloured Grapes we have seen this year. Besides these were Gros Maroc, Black Hamburgh, and Alicante.

Mr. Mitchell, gardener to J. W. Fleming, Esq., Romsey, had to be content with second prize, a defeat he has not suffered for some time before. His Gros Marocs were specially fine in every respect, his Muscats heavy in bunch, and Madresfield and Black Hamburgh well coloured. Mr. Strugnell was third.

Muscats of Alexandria again found a winner in Mr. Taylor, his clusters being very large and the colour, for the year, wonder-

fully bright. Mr. Mitchell, with heavy bunches, came second, and A. R. Baily, Esq., Frome (gardener, Mr. Taylor), third. There were other exhibits in this finely-filled class.

With Black Hamburghs, Mr. J. Ayers, gardener to J. F. Hall, Esq., Wells, won from Mr. Mitchell with jet black bunches, though not so heavy or so well finished as the Romsey Grapes, as there was a marked deficiency of bloom. The class for any other black was a good one, Mr. Marsh's grower, Mr. W. Taylor, again excelling with well-finished examples of Gros Maroc, Messrs. Mitchell and Jefferies following.

Four competed with a collection of eight dishes of fruit, Mr. Mitchell staging handsome Gros Maroc, and Muscat Grapes, Best of All Melon, Pine Apple Nectarines, Dymond Peaches, Brunswick Figs and Apples. Mr. H. Jones, Bath, was second, and Mr. Strugnell third.

Mr. Mitchell took the leading cards with Peaches and Nectarines, both fine in colour and size; and Mr. Wilkinson, Tyntesfield, secured both prizes for Melons in the open classes, with finely-flavoured fruits.

Apples, both cooking and dessert, made a wonderful show, and must have nonplussed not a few who regard the season as a blank in an Apple sense. With three dishes of dessert, Messrs. W. Fisher, Batheaston, and J. Ayres, Wells, staged beautifully coloured specimens, Lady Sudeley being particularly bright. Mr. F. Wait, Bath, won from Messrs. Somerville and Fisher with a single dish. Culinary sorts were in strong force. Mr. Ayres staged for first prize Gascoyne's, Warner's and Peasgood's excellently. Pott's Seedling, in Mr. Wait's second prize lot, was also a fine dish. Peasgood's Nonsuch, as usual, led for a single dish, Mr. H. H. Hill, Wells, having a very fine dozen. Warner's King also was shown well by Mr. Hall, Bath.

Plums, like Apples, were fine; so, too, were Filberts; and Pears could not fail to have interested or made envious those who have so many barren trees at home.

As at most other shows, vegetables were of fine quality, though at Bath the schedule does not provide for much extent in variety. Mr. W. D. Porter, Batheaston, won with the collection of twelve dishes; Messrs. Stokes and Son, Petatoes; Mr. Vilven, twelve Tomatoes and a fine basket of salad; Messrs. Cray and Sons, Frome, Cucumbers and yellow Tomatoes. For Messrs. Webb and Sons' prizes for a collection, four competed, Mr. L. Amos and Captain Gillings' gardener being the most successful.

Non-competitive exhibits comprised a splendid assortment of single and double Begonias from Messrs. Blackmore and Langdon, Twerton; a large collection of flowering and foliage plants from Messrs. Garaway and Co., Clifton; a fine assortment of Zonal and Ivy-leaved Pelargoniums from Mr. Vincent Slade, Taunton; Roses from Messrs. Cooling, Bath; and six baskets of nicely selected market Tomatoes from Mr. Vilven, Bathford Nurseries, Bath. The varieties were Up-to-Date, Holmes' Supreme, Cropper, Lister's Prolific, Dyer's Seedling, and Vilven's Selected.

### Dundee Horticultural, August 27th.

The annual exhibition of this, one of the most popular horticultural societies in Scotland, lasted for three days. Favoured with fine weather, the exhibition was a great success, both as regards the show itself and from the financial point of view, the number of visitors having exceeded all previous records. The exhibition filled three large marquees, which were most effectively arranged, and presented a most attractive appearance. The number of entries in the various classes exceeded 2,000, a very large number, considering that the competitors nearly all come from the district round Dundee.

The most imposing section in the exhibition were the pot plants, which were not only numerous, but generally of a quality that would not have needed to blush at any of the largest shows in the kingdom. The leading prize was for a display arranged for effect on a table 16ft by 8ft, cut flowers and cut foliage admissible. The only competitor was Mr. James Beats, gardener, Binrock, Dundee, who put up a showy, elegantly arranged, and highly attractive exhibit, containing well coloured Crotons, Dracenas, variegated Eulalia, &c., interspersed with vases of Chrysanthemums, Cannas, Lilliums, &c.

For a table of plants 9ft by 5ft Mr. Meston, gardener to R. B. Don, Esq., gained the premier award with a most pleasing arrangement of the plants usually seen in such exhibits, all nicely grown, and the foliage plants bright and healthy.

In the classes for specimen plants there was much better competition, the prizes being largely gained by Mr. R. W. Saunders and his brother, Mr. David Saunders, both well-known plant growers near Dundee. The class for six stove and greenhouse plants was most keenly competed for, and the specimens shown very excellent. In Mr. R. W. Saunders' first prize lot *Ixora speciosa*, *Statice profusa*, and a magnificent Palm (*Areca lutescens*) were specially noticeable. Mr. George Scott, gardener, Leathwood, was also a prominent exhibitor, his plants of early Chrysanthemums, Lilliums, and Pelargoniums being very good. Mr. James Bethel, Westwood, Newport, was to the front

with British Ferns and Alpine plants, which were both well grown and of great interest. The

#### Cut Flower Section.

drew a very large and keen competition, while the quality generally speaking was such as to demand a great deal of close scrutiny. Sweet Peas in vases were a prominent feature, and the prize lots were of most excellent quality. Mr. Fairweather, gardener to Lord Provost Barrie, scored a distinct success for twelve varieties. Mr. Green was second, and Mr. Bethel third for good lots. Mr. D. Saunders was first for twelve bunches of stove and greenhouse flowers with a most attractive exhibit. Cactus Dahlias, Roses, Carnations, Begonias, Gladioli, Pelargoniums, and Asters were all good for the season, but space prevents detailed criticism.

In the floral decoration section there was a capital display of bouquets, both in the open and gardeners' classes, which were mostly very meritorious, showing marked improvement on recent years. In the open class Messrs. Perkins, of Coventry, who had travelled far for such moderate prizes, as might be expected, carried off the first prizes in the two classes with bouquets characteristic of their elegant, beautifully finished style, and rich selection of flowers. They were also first for a wreath, with a most elegant example of their charming floral work. With sprays and buttonholes they also led.

In the open class for bouquets Mr. Beatts, gardener, Binrock, was a very creditable second, and was first in the gardeners' class. Mr. Beatts was also second for wreath, with one that was much admired, though not quite up to the standard of work in that of Messrs. Perkins. This section attracted very great attention from visitors.

In classes for cut flowers for nurserymen, Messrs. D. and W. Croll, Dundee, were first for twenty-four blooms Roses, and also for twenty-four Tea and Noisette Roses, Messrs. Adam and Craigmile, Aberdeen, being second in both cases. For eighteen bunches hardy border flowers Mr. Wm. Farquharson was first with a good exhibit.

#### Fruit and Vegetables.

This section was not quite up to some former years, but contained some very excellent exhibits. The leading prize of the show was for a decorative dessert table, 9ft by 4½ft, for not more than sixteen dishes of fruit with floral decorations. There were two competitors, who showed most creditably. The first prize was awarded to Mr. James Beisant, gardener, Castle Huntly, with fourteen dishes, including four bunches of very excellent Grapes, good Muscat of Alexandria (two), Muscat Hamburgh, and Madresfield Court; also good Peaches, Nectarines, Melons, Apples, Pears, and Figs. The floral decorations were Sweet Peas for centre epergure and glasses of Malmaison Carnations. The effect was rich, but slightly heavy. The judges awarded 93 points, 78 for fruit, and 15 for decorations. Second prize was awarded to Mr. Richard Cairns, gardener, Balruddery, a well-known Grape grower. The Grapes here were similar sorts, but if anything rather better than in the first collection. The decoration was elegant, but rather commonplace—Poppies and Grasses, with Asparagus. This was awarded 89½ points, viz., 78½ for fruit and 11 for floral arrangement.

For a collection of hardy fruit Mr. Ross, Braco Castle, was first with middling specimens. For four bunches Grapes Mr. Beisant and Mr. Cairns were again first and second. For two bunches of Black Hamburgh Mr. Cairns was first with very excellent examples, also for Black Alicantes and Muscat of Alexandria. The other fruit classes were fairly well competed for, and the quality was good for the season.

The show of vegetables was very excellent, exhibiting a very high level of cultivation. For a collection of twelve kinds the first prize was gained by Mr. J. Kinnear, Fernhall, who was ahead of the veteran prizetaker, Mr. J. Harper, Tullibeltan, who on this occasion was second. Both lots were very fine, consisting of the best sorts now in season. Mr. Henry was third, but was first, however, in a collection of salads.

In the separate classes Leeks, Onions, Cauliflowers, and Tomatoes were conspicuous for fine quality. An interesting class for amateurs only (cottagers) was one for nine sorts of vegetables, for which a Corporation Cup and £2 was given as first prize. This was gained by Mr. A. Drummond, Fowles Wester, Crieff, with a very beautiful lot, that would have done credit to practical gardeners. Second was awarded to Mr. R. H. Low, Dundee. Mr. Drummond was also first for a collection of six varieties.

#### Trade Exhibits.

As usual, the nurserymen of Dundee added largely to the attractions of the show by their large and fine exhibits, each "putting his best foot first." Messrs. W. P. Laird and Sinclair occupied the most prominent position with a very attractive exhibit, very varied, yet tastefully and harmoniously arranged. A large number of very creditable bouquets, wreaths, harps, and other designs were shown, showing very marked ability on the part of the executant, though slightly wanting in finish. They

had also beautiful vases of Sweet Peas, Roses, Carnations, &c., and many choice decorative plants. Messrs. Laird and Sinclair had also an extensive display of Coniferæ and shrubs temporarily planted in the grounds outside the tents.

Messrs. Storrie and Storrie, Dundee, exhibited in very attractive form a large number of their specialities, prominent being very grand single Begonias, for which the firm is famous, Streptocarpus, Celosias, Iceland Poppies (very dainty new varieties), Apples in pots, &c. Messrs. Storrie also exhibited a number of flowers and foliage plants in very tiny pots, grown with very little earth by the aid of "Storrie's Invincible Solution," products which certainly seemed very wonderful, and evoked great interest from visitors.

Messrs. D. and W. Croll had a tasteful exhibit of Roses, Carnations, Sweet Peas, and very pretty table plants, including well coloured Crotons.

Messrs. Thyne and Paton exhibited a large collection of table and other decorative plants and cut flowers in great variety; also a number of beautifully trained Ivies in pots.

Messrs. James Cocker and Sons, nurserymen, Aberdeen, came south with a most attractive exhibit, principally of Roses, beautifully arranged in baskets. These were very fine, some lovely Général Jacqueminot, Captain Hayward, Mrs. Cocker, Caroline Testout, being the admiration of everybody.

Mr. John Forbes, nurseryman, Hawick, had a beautiful display of florists' flowers, Dahlias, Pansies, Carnations, Phloxes, Pentstemons (very fine); for a bright bold seedling, Dr. Barrie, he was awarded a certificate. Beautiful Gladioli came from Mr. George Mair, Prestwick, Ayrshire, which included some interesting novelties. Chrysanthemum maximum King Edward from Mr. Angus, florist, Penicuik, was much admired. A nice collection of hardy border flowers came from Mr. Wm. Farquharson, Perth, and a similar exhibit from Messrs. Murphy and Sons, Broughty Ferry. Altogether the show was a great success, and reflected great credit on the committee for their labour in arranging, more especially on the courteous and energetic secretary, Mr. Hill, who had every arrangement in "apple-pie" order. The gate money for the three days amounted to £704, of which £493 was taken on the last day of the show, a proof that the masses in Dundee are permeated with a love for the beautiful.—M. E. T.

#### Sandy, Bedfordshire, August 27th.

At Sandy Show all classes were well filled. The ten stove and greenhouse plants from Cypher and Son, Cheltenham, made a fine display, and Vause, of Leamington, came second. Groups by Finch and Vause were much admired. Six foliage plants were a good exhibit, and the six Ferns from Sir A. Marshall, Buckden Towers, did credit to the grower. The open Roses class was exceedingly good for the season, Messrs. Burch, Peterboro' and Harkness, showing in good style. The chief Dahlia classes were fine, especially the Cactus selection from Keynes, Williams, and Co., Salisbury. Sweet Peas, as usual, were largely shown, but not at their best, as the heavy rains of late had spotted them.

Table decorations filled the tent, and the first prize was a neat, clean, tasteful table from Mrs. Seabrook, Ramsey Abbey Gardens. Fruit and vegetables are the leading feature at Sandy, the tent being always crowded with the public from the opening to the close. Eight dishes of fruit brought five entries. The first prize went to the Earl of Sandwich, Hinchbrook, Huntingdon (gardener, Mr. J. Barson), Figs, Alicante Grapes, excellent Muscats, good in berry, but scarcely finished; Peaches, good; Nectarines, fine in size and colour; and Plums; also a good Melon. Mr. Folkes, Hemel Hempstead, closely followed, having Alnwick Seedling Grapes (excellent), also Muscats. His small dishes were not up to standard. Mr. Stone, The Downs, Croxton, was third.

The six dishes class was well filled. Mr. Sarle, gardener to the Marquis of Northampton, Castle Ashby, was first with splendid Muscats, the best in the show; but poor Alicante. There was a great falling off in his smaller dishes. Pines ought not to be allowed in the six dishes when not allowed in the "8." The second prize went to Mr. Lockie, gardener to A. J. Thornhill, Esq., Addington Hall, Hunts, with a neat, clean lot. Here only Foster's Seedling Grapes were weak, the other five dishes good. He had excellent Peaches, Nectarines, and Melons. I think the judges were led away by the Pine and the Muscats in the first prize exhibit. Mr. Modrel, gardener to Colonel Shuttleworth, was third.

The lead for two bunches of Muscats went to Mr. Barson, Hinchbrook, these being small, but clean and well coloured; second, Mr. Folkes. "Any other white" went to Mr. Folkes with capital Golden Queen.

Six Nectarines went to Mr. Lockie with fine Rivers' Orange; second, Mr. Barson. For six Peaches Mr. Barson led with fine Barringtons. Figs: Mr. Seabrook, gardener to Lord de Ramsey, who also had the best outside Nectarines. Mr. Barson was first for eight dishes of hardy fruit, good for the season.

Vegetable classes were crowded. For a collection of eight distinct, the best prize in vegetables (given by Wood and Ingram, the Old Nurseries, Huntingdon) went to Mr. Barson; second, Mr. Lockie. For Messrs. Carters', six distinct, Mr. Folkes was first, closely followed by Mr. Barson. The closest run in the show. Mr. Folkes' Leeks were good.

Sutton and Sons' prizes: Six distinct, first prize, Mr. Folkes, Hemel Hempstead (a fine, well-set-up lot, all produce good); second, Mr. Lockie. The Society's prize for six distinct: first, Mr. Barson. The Society's ten distinct: first, Mr. Lockie. Webb and Son's: Six distinct, first, Mr. Folkes; second, Mr. Barson. Potatoes were excellent, and collections were good. Mr. Seabrook had a grand lot, but got disqualified; Mr. Barson came first after that, with a neat, clean lot. Cucumbers were largely shown. Mr. Lockie was, as usual, first, his pair were perfect. Mr. Leeds Smith, Miss Fitzpatrick, and Sir Robert Edgcombe and many others had good exhibits.—B.

### Dumfries-shire and Galloway Horticultural.

The show of this society, held in Castledykes Park, Dumfries, on August 28 and 29, was one of the most successful ever held in the district, it being compared favourably with the memorable one held in 1862 to celebrate the society's jubilee. Since the present directors and secretary were appointed three years ago, the show has improved by leaps and bounds, and this year double the space occupied in 1892 was required for the exhibits. The quality has improved in a still greater ratio, and the show is now reckoned fully equal to any other held in the Scottish provinces. It was opened on the 28th by Mrs. Balfour Browne, of Goldielea, wife of Mr. J. H. Balfour Browne, K.C., who made an eloquent speech after Mrs. Balfour Browne had declared the show opened. On the two days more than 3,000 visited the park, and on the Saturday locomotion in the marquees was difficult on account of the crowds.
